Revised Budget Resolutions Affect Sanitary and Heating Industry

Number of Important Changes in Customs and Inland Revenue—
What Members of the Industry Think of the Changes—"Manufacturers" Doing Over \$10,000 of Business to be Licensed—New
Sales Tax to Avoid Pyramiding

THE original budget resolutions as announced by the Minister of Finance, and the subsequent amendments which have just been made, concern a number of points of interest to sanitary engineers.

The imposition of a six per cent. consumption or sales tax is to be made on the sale price of all goods produced or manufactured in Canada. This tax, which does not now become effective until January 1 next, is imposed at the source—at the first stage of business operations. It will apply on the duty-paid value both of home-made and imported goods. This tax will take the place of the present graduated sales tax amounting to a total of 4½ per cent. with which the trade are well acquainted. It is felt that the eliminating of pyramiding in this tax and the elimination from the sales tax of the raw materials purchased by manufacturers, will considerably reduce the burden of the sales tax when this change is made.

The sales tax is not to be payable in the case of goods exported, or on sales between licensed manufacturers of materials to be used in the production of articles. It will not apply on goods imported by a licensed manufacturer or producer to be used in the production of articles for sale.

To Interest Tinsmiths

Of interest to tinsmiths in view of various rulings which have been made classing them as "manufacturers" is the provision for licensing of all manufacturers doing over \$10,000 of business a year. The provision covering this is as follows:

(1) A manufacturer or producer who produces goods to the value of ten thousand dollars or more during any fiscal year shall take out an annual license, the fee therefor not to exceed two dollars. The minister may direct that a manufacturer or producer who does not manufacture or produce goods to the value of ten thousand dollars a year, and who uses a substantial portion of goods

which are exempt from the tax is liable to tax, shall take out a license and shall be subject to the same conditions as the licensed manufacturer or producer.

This provision is effective on the day of passing such enactment.

License Certain Jobbers

A provision concerning the licensing of certain jobbers who sell a large proportion of their goods to licensed manufacturers, is of interest to the plumbing and heating industry in view of the fact that many firms are both manufacturers and wholesalers. The provision is as follows:

(2) A wholesaler or jobber who sells not less than fifty per cent. of his total sales of goods to licensed manufacturer or producer, to be used in articles to be produced for sale, may be granted an annual license, the fee therefor not to exceed two dollars. Such licensed wholesaler or jobber shall give security that he will keep proper accounts and render true statements of sales to licensed manufacturers or producers and pay any tax imposed by the said act.

How the Tax is Payable

(3) The said tax shall be payable by a licensed wholesaler or jobber at the time of the sale by him to other than a licensed manufacturer or producer of goods the price of which shall include in the amount of excise duties, if sold in bond, or the price of which shall be the duty paid value thereof, if imported.

(6) A manufacturer or producer who does not produce goods of a value over ten thousand dollars a year, unless he comes under the provision of paragraph one of section three of this resolution, shall not pay the said consumption or sales tax on goods produced by him, but he shall pay the tax on importation.

Provision Made for Refund

(7) A refund of the amounts of the said consumption or sales tax may be granted in the following cases, that is to say:

(a) To a wholesaler, jobber or other dealer in goods sold to a licensed manufacturer or producer to be used in articles produced for sale or with the consent of the wholesaler, jobber or dealer a refund or deduction may in the like case be granted to a licensed manufacturer or producer; or

(b) To a licensed manufacturer or producer or a licensed wholesaler or jobber, in respect of goods on hand on the 1st of January, 1924, and which are to be used in the production of articles for sale, no refund to be allowed in respect of goods on hand after the 31st of March, 1924; or

(c) On goods manufactured or produced in Canada, when satisfactory evidence is produced that such Canadian goods are at a disadvantage, by reason of the fact that like goods may be imported into Canada free of duty, such refund or reduction not to exceed 25 per cent. of the said tax otherwise payable; or

(d) On imported goods on which customs duties have been refunded on exportations.

The budget provides for a discount of 10 per cent. on whatever duty may now be payable according to the varying rates of the British preferential tariff, this not to apply in the case of any article on which the duty is not above 15 per cent., and to apply only when the goods are brought direct to the ports of Canada.

Receipt Tax Changed

The receipt tax is considered sound and is to be adhered to. An amendment just passed provides for putting changes in this tax into effect from the date when the bill founded on the resolution is assented to. This cancels the former regulations as respects receipts by or on postcards, form letters and letters, and such forms of receipts will therefore now be subject to tax.

The tax on cheques is changed somewhat by making the maximum tax on

(Continued on page 32)

Some Cancellation of Early Deliveries Due to Postponement of New Sales Tax

Some Plumbers Had Placed Orders With Manufacturers for Delivery in July of Goods Ordinarily Delivered in August and September, But Now There is No Advantage—Postpones Any Revision of Plumbing Prices on This Account

DISCUSSING the amendments to the tax and tariff provisions, as announced in this issue of Sanitary Engineer, a number of manufacturers and wholesalers have raised some interesting points in connection with the application of the amended resolutions to the sanitary and heating industry.

Concerning the change by which wholesalers doing "fifty" per cent. or more of their business with licensed manufacturers will be licensed, instead of "thirty" per cent. as formerly, one Toronto wholesaler pointed out that this was a much more favorable condition. Under the thirty per cent. a number of wholesalers who sell very largely to the trade in the ordinary way would come under the provision and be licensed whereas others who were really in competition but whose sales to licensed manufacturers did not quite come up to 30 per cent. would not be licensed. The disadvantages of this discrimination are quite apparent.

This wholesaler points out that while the disadvantage of tying up capital in sales tax still exists in the case of the unlicensed wholesaler as compared with the licensed jobber, that the new ruling removes from the licensed class practically every wholesaler except those who do almost an exclusive trade with manufacturers, and who are not ordinarily regarded as being in competition with wholesalers doing the bulk of this business with the trade. The amendment puts all such jobbers on an equal footing and removes any discrimination.

Gives More Time

This wholesaler intimated that the postponement of putting the increased Sales Tax into effect until January 1, 1924, will give much more time for the matter to be fully gone into and for wholesalers and manufacturers to figure it in making their plans for the next year. Altering the tax in midsummer would make it difficult for the trade to plan for its effect on seasonal lines. It was pointed out that the tax was postponed until January 1 next probably on account of the fact that many companies end their financial year at that time, and the changed tax could better be provided for at that time.

Another manufacturer stated it as his opinion that the application of the

higher sales tax was postponed because protests made by manufacturers and wholesalers that a special mid-summer physical inventory of their business would have to be taken to provide for refund of sales tax on materials on hand and the increased tax to apply on sales. As most firms conduct their annual inventory at the end of the year in any case, the new provisions will entail less work at that time.

Postpones Revision of Prices

The postponement of the higher sales tax will postpone any revision of prices on this account such as has been predicted. It has brought about a change in delivery requirements of jobbers as well, due to the fact that with the higher tax coming into effect on purchases from manufacturers after August 1, some jobbers had placed orders for delivery in July which ordinarily would not have been delivered until August and September. Letters are now going to manufacturers cancelling the earlier delivery date and letting delivery take its normal course.

There is a new provision which allows for the deduction on account of sales tax on goods sold at a price fixed by contract of sale made before May 12, 1923, and still in force at the time of delivery of the goods, provided such deduction does not exceed the difference between the amount of the $4\frac{1}{2}$ per cent. sales tax now in effect and the proposed tax of 6 per cent. to be in effect after January 1, 1924, and that this deduction will not apply on goods delivered after March 31, 1924. Discussing this new provision, a wholesaler pointed out that with the exception of certain cases where unusual conditions existed, this would apply most generally to general contracts which are figured on much in advance and where orders have been placed or specifications submitted on the basis of prices figured on the existing sales tax. It was also thought to apply in the case of a wholesaler or retailer having made a contract with a manufacturer for goods at a certain price before May 12, 1923, where such goods will not be delivered until after January 1, 1924, when the increased sales tax ordinarily becomes effective.

Postcard and Letter Receipts Now to be Taxed as Receipts

SOME changes are likely to be made in the procedure in a number of business houses as result of the amendment which makes postcards, form letters and letters, in the form of receipts, taxable as receipts. These were formerly exempt from the receipt tax and as result a number of firms had considerable quantities of such forms printed so as to effect a saving of the amount of the receipt tax. One wholesale plumbing merchant in Toronto who has been using the postcard system still has a large supply of them on hand and intends to use them while they last. Of course they will have to bear the receipt tax stamp of 2 cents on all amounts of \$10 and over. This card merely states the amount of the remittance, pointing out that this has been credited to the account. When these cards are used up a return will be made to the previous plan of receipting the invoices or statements.

A question has been raised by a whole-

saler in this connection concerning the status of letters which have to be written concerning an adjustment of account. For instance a customer sends a remittance and draws attention to some error in his statement of account. It is necessary for the wholesaler or manufacturer to write a letter concerning the adjustment, but the letter may also acknowledge the receipt of the money. The only satisfaction which can be secured in the way of rulings on such matters yet is that firms need only provide one receipt for money received and this receipt whether in the form of a letter involving other matters as well, or in the form of a receipted statement, must bear the tax stamp.

Another Toronto manufacturer has also been using a special printed form designed to act as a receipt, but is of the opinion that this plan will be discontinued in view of the changes which have been made. He is of the opinion that because of the extent to which firms

Important Points in Budget Resolutions Affecting Sanitary and Heating Engineers

Imposition of consumption or sales tax of 6 per cent. after January 1, 1924.

After that date sales tax to be source of production or import and not carried down through wholesalers, etc., as at present.

Licensing of all "manufacturers" doing over \$10,000 of business a year. This will probably include tinsmiths who have been classed as "manufacturers," for sales tax purposes.

Sales between licensed manufacturers, such as on raw and semi-finished material are exempt from sales tax.

Refund to be made to manufacturers on materials on hand on January 1 and up to March 31, 1924.

Brass and copper scrap free on all tariffs.

Discount of 10 per cent in British preference tariff on

certain goods admitted through Canadian ports without transshipment.

Placing of drain tiles for farm purposes on the free list.

Duty on emery and carborundum wheels altered.

Wholesalers selling over 50 per cent. of turnover to licensed manufacturers to have license and keep records of sales.

Receipt tax exemption on postcard, form letter and letter receipts is cancelled. These now to be taxable.

Stamp tax maximum lowered from \$2 to \$1.

Deduction on account of sales tax on goods sold on contract made before May 12, 1923, and still in force at time of delivery of goods.

Drawn or seamless iron or steel tubing over 4 inch in diameter for drilling for water, gas and oil.

Emery and carborundum wheels altered on customs tariffs.

have evaded this tax by following the plan of using cards or form letters as receipts.

A large number of firms have been following this plan and steps are being taken to alter it to conform to the new regulations, effective from the enactment of the Bill.

An Ontario manufacturer of tools, heating equipment, etc., is of the opinion that the higher Sales Tax of 6 per cent. imposed at the source will give him considerably more accounting work. He states it is the intention to show the Sales Tax on all invoices to jobbers and retailers and manufacturers, subject to departmental rulings concerning certain products which are to be considered raw material for jobbers, retailers or other manufacturers.

"We consider that if the 6 per cent. sales tax is not shown on the invoice it will become a turnover tax for manufacturers instead of a sales tax as intended by the government. The reductions in the British preference will certainly have an effect on lines we manufacture in competition with Britain. We will have to reduce our prices accordingly or cease to manufacture such lines.

"Any lines on which we have established a resale price, it is our intention to increase this price so that the consumer will pay the additional price and the profit of the jobber or retailer shall not be reduced."

C. A. McKane, Grimsby, Ont. has plumbing contract for two family flat which R. J. Snetsinger is building.

PLUMBING TRADE QUIET

John W. Bruce, Toronto, international vice-president of the plumbers and steamfitters, in a recent interview did not endorse previous stories of improving conditions on the Pacific coast particularly in the plumbers' or-

ganization. Of the entire membership in Vancouver 40 per cent. had left for the United States and of the remaining 60 per cent., approximately half of these were out of employment. The lumbering industry was, however, improving to a certain extent and this would eventually have a good effect.

To Improve Rural Sanitation

The equipment of the truck fitted up with sanitary and heating equipment by the Ontario Government as fully described in a recent issue of *Sanitary Engineer* is well shown in this illustration secured by *Sanitary Engineer* while the truck was on exhibition near the Parliament Buildings, Toronto. The completeness of the equipment is clearly indicated, all fixtures being connected up ready for use. On the other side of the central partition is equipment for a modern laundry.

Follows Building Permits

ONE live Hamilton sanitary and heating engineer whose business has been sufficiently active throughout many months past to justify the steady employment of about a dozen mechanics, recently told Sanitary Engineer of the methods he has adopted to further the sale of heating equipment.

While he makes a big endeavor through the use of special report cards to find out the condition of the heating equipment in the homes in which certain work is being done, and concentrates on these prospects with the most effective material at his disposal, yet he is confident that a large proportion of work can be constantly secured in connection with new building providing the

right means are adopted to go after it. In his own particular case he is a close follower of the building permits being issued in the city. He finds that the people taking out such permits are the very best prospects for heating equipment as well as plumbing requirements. He has many splendid orders to the credit of his firm secured by being right on the job at the time the permit is issued, or sometimes before it is issued. A close association with this department of the city work enables one to secure much valuable information on contemplated work and many opportunities are offered to figure on work.

Heating Schools and Churches

SCHOOLS and churches provide a splendid field of business in sanitary and heating equipment. In such places the public health is endangered on a big scale if adequate facilities are not provided. The question of cost is not so important in such cases as with private individuals, and the sanitary and heating engineer has a real chance to get such business both for new and renewal installations providing he can go before the school boards or church boards with some definite facts concerning the value of the equipment he has to offer.

Good Business in Fuel Savers

ST. JOHN, N. B.—There are two interesting phases about the business of W. J. Crawford, a St. John, N.B., plumbing and heating contractor. The first is that despite the tendency of plumbing and heating contractors to get off the shopping district because of the increased rentals, Mr. Crawford has retained his store and office in the same location. The second interesting phase is that Mr. Crawford has recently established a side line.

The section of the city in which the Crawford shop is situated is one of the busiest of the St. John shopping sections and on what has been familiarly termed "the right side of the street." Despite the trend of the plumbing and heating contractors to the side streets and less busy thoroughfares due to the high rentals, Mr. Crawford has continued in his old stand. Being within the beaten track he is within easy access.

The side line he has established is a fuel saver, an appliance that is designed to increase the life and usefulness of coal. A side line of this type is appropriate, he says, for a heating business, particularly as there are a number of opportunities wherein both can be combined on one contract.

The Crawford plumbing and heating shop is now the only

business of this kind with headquarters on "the main stem" of St. John. The Crawfords have been interested in plumbing and heating in St. John for more than forty years.

Would Pay to Scrap Old Furnaces

ONE Ontario heating engineer who is making a good success of the sale of heating equipment, has studied very

carefully the needs of his community and has something interesting to say about the merchandising of this line. It happens to be a very Scotch community, and the majority of his prospects have that very creditable faculty of seeing that they get value for their money. Some of them were hard to move when approached on the basis that they should replace their present equipment with new stoves and furnaces, so the merchant was

forced to find some more effective means.

Analysing his own particular case he found that he was losing money each year through heat loss due to defective equipment. This gave him the idea and he immediately commenced to talk up through his advertising and personal effort, the fact that a new heating system would pay for itself in a very short space of time at the present cost of fuel, by the saving it would effect. The prospects were shrewd enough to realize the merit of the claim and many sales resulted.

A Young Man's Industry

JUDGING by the time and energy spent on discussions of the apprenticeship problem at recent plumbers' conventions, this question is assuming serious proportions. The pendulum of economic balance in the field of employment has swung in one year from widespread unemployment to that of actual labor shortage in many lines. This shortage is due to restricted immigration, to the emigration of some workers and the lack of any suitable apprenticeship system. The loss from apprenticeship affects the skilled trades. The job in connection with common labor is for the government, but for skilled trades a system of developing apprentices must be devised based on the fundamental question of how many new workers are needed each year in a trade.

Plumbing and heating is a young men's industry, figures showing that 78.3 per cent. of the workers are under 45 and 21.7 per cent. over 45 years of age. In the United States so serious has the problem become that a national apprenticeship campaign has been instituted. A poster has been prepared entitled "Wanted, Real Boys" which employers are to put in their windows.

A booklet on "A Business Future for American Boys" is being distributed containing attractive arguments in favor of these industries. It declares that "There are no trades, occupations or professions offering more advantages than

plumbing and heating for the average boy of mechanical inclination. They offer more money in a ten-year period of life expectancy than the majority of trades or occupations. After a four-year training or apprenticeship, plumbing or heating will give a boy a highly profitable trade; an interesting and constructive work, with plenty of diversity, offering unlimited possibilities for mechanical and commercial ability. The heating and plumbing trades will pay a boy a good wage while he is learning and make him worth even more in the long run than he can secure at some temporary highly-paid job." Facts are also cited as to the business possibilities and the potential market. For example: "Of the 22,500,000 homes in the United States, approximately 18,500,000 are without efficient heating equipment and 17,500,000 are without adequate plumbing facilities. Only 680,000 of over 5,500,000 farm homes are equipped with plumbing." Much the same proportions exist in Canada, some statistics covering which appear elsewhere in this issue.

Stove Selling on a Mileage Basis

ONE Quebec heating engineer who does a good business in stoves, furnaces, ranges, etc., says that every time the county clerk issues a marriage license a stove prospect is made—some dealer somewhere is going to sell a stove at some time. That couple may never purchase an automobile, or be in the market for tires or an overstuffed living room suite, yet they will see three times as much advertising on those articles

as they will on stoves. A little concentrated solution of well-thought-out advertising applied to the stove department will produce surprising results.

Some dealers get frightened the minute the word "advertising" is mentioned. They think of advertising in terms of dollars and cents. But don't get nervous at the word advertising as used in this article—envelope inclosures, package inclosures, word-of-mouth, road signs, window displays, etc., are forms of advertising and strange to say—the cheapest but often the best. If you sell a man a good heater and he tells you he likes it, refer prospective customers to him and he'll advertise the heater for you—that's advertising in its best form—often spoken of as word-of-mouth advertising. There are just as many other inexpensive methods of advertising.

Now this man is undoubtedly a car owner and therefore he is interested in tire mileage. We never thought of such a thing as a range figured in mileage; however, here's what he has to say on the subject: "Here's a good range for \$90. It will last 16 years. Three meals per day will be cooked, which means over 1,000 meals per year. The cost per meal is only half a cent. A cheaper range, costing \$20 less, only makes a difference of one-tenth of a cent per meal. For such a small amount would a man deprive his wife of the superior features, the satisfaction of the best and the convenience and comfort of cooking?"

Are Your Buildings Well Heated?

ONE man in the trade who has had much experience calling upon plumbing and heating shops throughout the country points out that a very large portion of the trade

themselves are apparently not very well sold on the value of modern plumbing and heating equipment. True they show the most up-to-date equipment in their showrooms, but the odd thing is that in many cases they do not practise what they preach by having their own business premises and homes similarly well equipped.

A sanitary or heating engineer cannot sell modern heating equipment successfully if he himself is

not well sold on the idea, and whose place of business is not a standing advertisement of the value of such equipment. All the talking in the world won't convince a prospect that he should instal such equipment if he sees that the man who is trying to sell him does not himself follow the advice.

What a grand opportunity there is for sanitary and heating engineers to interest prospects by having a clean, well lighted, well heated and well equipped showroom or other business premises in which to talk business. It would help make the prospect feel more at home. Such equipment might also be used as a convenience for passers-by, and the prospect would certainly be much more impressed.

Retail Stores are Good Prospects

AMONG the best local prospects which the sanitary and heating engineer can find for the equipment he sells, are the retail stores. Go into any town or city and note the

hundreds of retail stores which have the poorest plumbing and heating equipment installed in them. Frequently such buildings are rushed up on a speculative basis and little attention is given to adequate heating arrangements. They could frequently be provided with

sanitary conveniences for the use of customers as well.

People are obviously not in a good mood to buy when they are uncomfortable. This is proved by long experience. There is a psychology involved here which is fully taken advantage of by various organizations which have to depend for their living upon the volume of sales, generally of articles which ordinarily are difficult to dispose of. While this is not so much necessary in the case of the necessary lines which many trades have to sell, the fact remains that people will frequent the store which makes them feel at home, and they cannot feel at home in a store which is poorly equipped from the standpoints of sanitary, heating and ventilating equipment. Here lies a real chance for effective sales talk.

IN HOT WATER!

It is probable, uncomfortable or at least inconvenient to be in hot water these warm days. But what we wish to draw your attention to is, will you be in real hot water when you need it? Right now is the time to have our expert heating men look over your hot water or steam heating system and put it in order. Heating men are always busy at the fall of the year and you are apt to not have the good service available right now.

Have us look over the matter of hot water radiator you would like to have installed and we will guarantee you satisfaction.

Group of ads by plumbing and heating engineers showing the extent to which heating equipment can be advertised effectively at this time of year.

VARIOUS heating equipment lends itself well to featuring in the ads. of plumbing and heating concerns and a number of samples of such advertising from papers throughout Canada as shown herewith, gives some idea of the extent to which heating equipment is being advertised.

H. T. Gagnon, North Bay, Ont., advertises that he makes a specialty of heating and ventilation on large and small buildings, and is able to handle large contracts. He will furnish heating plans and estimates and lays out all his work personally. He absolutely guarantees all his work, and claims to give 100 per cent. value. Using an illustration of a radiator his ad. points out that he gives quick and expert service on heating, ventilation, plumbing, metallic ceilings, roofings and sidings, pumping outfits, heating outfits.

Gas Water Heaters

The ad. by Ross Belyea, Toronto, deals with gas water heaters stating: "We don't claim to make washing such a

pleasure that it will take the place of bridge or whist, but we do claim the job is a lot easier when you have all the hot water you need right in the tub faucet. Our heater installed in your home will put an end to most of that wash-day drudgery. No fires to build, no kettles to lug. No hot water accidents. And the nice part about it is that this convenient way is least expensive. Have a — automatic installed to-morrow and meet next Monday with a smile. Get our prices."

F. C. Kulow, Port Colborne, Ont., advertises a spring clearance sale of a complete line of stoves and ranges.

Radiator Doesn't Heat

McKelvey & Birch, Ltd., Kingston, Ont., have a somewhat unusual heating ad. entitled, "Extra heat or heat you are not getting." It states: "Possibly there is one or two radiators that do not heat up. Have our Plumbing Department examine them and see where the fault is. You may desire more

hot water from your range boiler. Let us connect it to your furnace with a domestic heater."

Cowan's, Brantford, Ont., have an ad. entitled, "Make your bathroom distinctive." This ad. illustrating a bathroom and an electric water heater, states: "Bathrooms that are ordinary can, with the aid of a few small fittings, be made distinctive and expressive of the good taste of the housewife.

"Your bathroom equipped with our towel bars, sponge holders, tooth brush holders, tumbler holders, plate glass mirrors, white enamel cabinets, etc., will add wonderfully to the appearance as well as to your comfort.

"Hot water in your bathroom, heated electrically the scientific way. Thermo-electric water heating devices may be seen in our window in actual operation."

Under the heading "Make your home comfortable and sanitary," Greenaway & Elliott, Bowmanville, Ont., state: "Are you enjoying all the comforts of a home? You are not unless a modern sanitary bath room equipment is included. Don't be afraid of the cost, it is trifling compared with the satisfaction and convenience it affords you."

T. J. Minnes, Brantford, Ont., has an ad. which reads: "In Hot Water! It is probably unseasonable or at least uncomfortable to be in hot water these warm days BUT what we wish to draw your attention to is, will your hot water heating system be in readiness when you need hot water this coming fall and winter? Right now is the time to have our expert heating men look over your hot water or steam heating system and put it in order. Heating men are always busy in the fall of the year and you are apt to not have the good service available right now.

"Have us look into the matter of that extra radiator you would like to have installed. Have the valves on your radiators repacked and prevent extra expense and inconvenience next winter. Have us lay out a hot water or steam heating system for you now."

The ad. by Eggett & Co., London, Ont., illustrates effectively the use of hot water at the kitchen sink and bathroom, pointing out that steam heating equalizes the heat throughout the home. The ad. by Paddon Co., Ltd., Windsor, illustrates a water heater on the kitchen range boiler and other kitchen fittings.

Team Work of Plumbers and Gas Company in Selling Gas Water Heaters

Suggested Solution to Aggravated Situation Respecting Competition in Sale of Gas Water Heaters in Montreal Lies in Experience of Another City

THE age-old controversy over the competition of gas companies with plumbers in the sale of gas water heaters has developed a somewhat new angle in Montreal, where recent developments along this line have been such as to make it practically impossible for plumbers to compete with the Montreal Light, Heat & Power Co.

Sanitary Engineer understands that the Eriez Stove & Mfg. Co., Montreal, makes, among its various lines, the "Lion" gas water heater. Practically the entire output of the factory is understood to be sold to the Montreal Light, Heat & Power Co., and at such a price as enables installation complete at \$20.00.

In view of the fact that the price to the plumber on this or similar heaters is from \$13 to \$14, it is quite apparent that the plumber would have difficulty in doing a profitable business in gas water heaters when he has to meet the local competition at a price of \$20. It is generally estimated that galvanized and gas pipe, fittings, labor and margin of profit run the cost of installation alone anywhere from \$12 to \$15, so the plumber would have to get approximately \$28 for the job installed to make it worth his while.

Aggravated in Montreal

Analysis of the situation existing throughout Canada would seem to indicate that the situation is much more aggravated in Montreal than elsewhere. In Toronto, for instance, the Consumers Gas Co. make a charge of \$27.50 installed, for a similar type of water heater.

The best solution of the question would seem to lie in bringing the gas companies to a realization that they are doing themselves harm by the policy they follow. They do themselves harm from two standpoints, viz., they lose the support of the plumbers in furthering the sale of gas appliances and thereby selling a less volume of gas than is possible, and, secondly, they lose money themselves because there is no necessity of their having to make installations of gas water heaters at such a ridiculously low price. Unfortunately the plumber has not been able to compete with such concerns because of the fact that certain gas companies or other local

utilities have been satisfied to sell the appliances at practically wholesale prices and then charge up their own selling expense and installation costs as a part of the general overhead of business.

The folly of this latter plan was amply demonstrated at the last meeting of the American Gas Association, when two new sub-divisions were appointed to work with the plumbing and heating dealers for the furtherance of gas appliance sales. Educational work has revealed to the gas companies that they have failed to properly embrace the opportunities presented through the potential selling efforts of the thousands of plumbing dealers throughout the country and the fact that a large proportion of these dealers are now genuine merchants rather than master mechanics. That the American Gas Association has given prompt and cordial acceptance to the proposals of the representatives of the plumbing industry is evidenced by the creation of the new committees to iron out their differences.

What One City Did

Going more into specific detail we will outline briefly what F. A. Woodhead, manager Arlington Gas Co., has to say about the way a similar local situation was overcome. The idea was conceived in the spring of 1921 that the Arlington territory contained plumbers whose co-operation would result in mutual benefit to the gas company and the plumber. Meetings were held and nice dinners were enjoyed at the expense of the gas company. Plans were made for both sides to assist each other in the selling of gas appliances. After the first six months the idea was not as successful as it might have been because it was not to be expected that a gas company could expect, after years of monopolizing the gas appliance business, to say, "Boys, we will now be good and because our prices are higher we want you to help us to get more gas appliance business," and expect the plumbers to bite. No sir-ee, it didn't work. So a new plan was proceeded with, involving some horse-sense.

We decided that many people take the advice of plumbers on the question of water heating, so we had further gather-

ings to tell them all we could about water heating so they would know the best kind of water heater for their customers. Some gas men might say, "Too much bother and worry" or "It can't be done," but we stuck and won out. To-day we have twenty-eight of the best plumbers in our territory pulling with us and they have signified their intention to abide by a gentlemen's agreement existing between us as follows:

The Agreement

Whereas it is clearly understood by the plumbers that it is necessary that gas water heaters be sold and installed on the gas company's lines to promote the sale of gas; and

Whereas, it is understood that in order to promote the sale of gas, through these appliances it became necessary for the gas company to undertake the installation of these appliances, which they are now doing; and

Whereas, it is understood that the plumbers are desirous of acquiring the business of selling and installing these appliances and represent that they will push the sale of said appliances; and

Whereas, the gas company is willing to turn over the selling and installing of these appliances to the plumbers as fast as the plumbers show they are capable of selling and installing them in volume and proper manner, to warrant the gas company so doing. Now, therefore, the parties hereto agree as follows:

That they will immediately start a co-operating plan for the selling and installing of these appliances, which will have for its object the promoting of the sale and installing of gas water heaters and accessories thereto. The co-operating plan to be along the following lines:

A committee shall be appointed, having a proper representation from the gas company and a proper representation from the master plumbers. This committee to work out the details of operation of the co-operating plan.

It is understood and agreed that the committee shall have the power and right to make all necessary arrangements for the carrying out of this co-operating plan and all questions arising shall be decided by the committee and their decision shall be final.

The gas company to stock water heaters and accessories subject to the approval of the committee.

The committee will be asked to help select the type, size and quantity of heaters to be stocked by the gas company.

The gas company to furnish the plumbers with heaters, subject to the approval of the committee, delivered as follows:

The heaters which have been approved and carried in stock by the gas company, which are bought from the gas company by the plumber, shall be subject to the customary jobbers'

discounts on the various types. Maximum discount to be governed by the committee. Heaters to be delivered f.o.b. job by gas company. The gas company to advertise, exhibit and demonstrate heaters to the public. The gas company is to ascertain, as far as possible, if the customer prefers a plumber to make the installation and, if so, who.

When connections are made by the plumber, he bills directly for the work to the customer. The plumber has the privilege of carrying on the whole transaction, making the sale and complete installation.

Unless the gas company has been notified that the plumber has sent his customer, and the gas company makes the sale and installation, it would be made without compensation to the plumber unless he could prove to the committee that he had worked on that prospect, in which case he would receive 5 per cent. Should the gas company be advised that the plumber is sending his customer, the sale would be made on a basis of 5 per cent. to the plumber, except it be definitely understood that the plumber has practically made the sale and the customer simply wants to see the size and type of heater in operation.

The plumbers agree to co-operate with the gas company by recommending the same size and type of heater as recommended by the joint committee.

Installations made by plumbers signing this agreement, which prove faulty and unsatisfactory to the gas company's inspector, shall be changed, according to the gas company's instructions, by the plumber at his own expense. Reports of such wrong installation shall be made to the committee.

The gas company shall maintain a water heater and service department. This department shall continue to connect, disconnect and re-connect heaters in accordance with this agreement.

The gas company agrees to furnish the plumbers with special information on water heating and the plumbers agree that they will confer with the gas company on various projects for different methods necessary to make a proper installation.

This agreement to exist until it becomes unsatisfactory to either party.

As a result of this agreement, we have twenty-eight boosters in our territory where formerly they were "agin" us. In addition to that, our customers will benefit by having better and more satisfactory installations.

There are three splendid results to be achieved by this plan of co-operating with the plumbers as follows:

1. Better public relations.
2. Increased jobbing sales and gas sales for the company.
3. Increased jobbing sales for the plumbers.

How ranges, range boilers, water heaters, showers, etc., may all be linked up in one display which drives home the advantages of modern plumbing and heating equipment in the home is well demonstrated in this group of windows arranged by Standard Plumbing and Heating Co., Winnipeg. This particular picture was taken about Christmas time, but displays on the same plan are kept constantly on view, linking up both departments of the business.

Plumber Finds Women Are Prime Movers in Sales of Plumbing and Heating Goods

Plumbing Specialties Induce Many to Enter the Showroom Who Become Prospects for Other Equipment—Encouraging Young People to Have Pride in Appearance of Their Bathrooms—Dark Materials as Background for Displays

Bathroom specialties displayed effectively on a background of black material, bring many prospects into the splendid plumbing showroom of T. J. Minnes, Brantford, Ont. Those induced to enter the showroom by this means are frequently developed into good customers for other requirements.

THAT there is an all year round business to be carried on in bathroom fixtures, at a nice profit, is the opinion of T. J. Minnes of Brantford, ex-president of the Ontario Society of Sanitary and Heating Engineers. The very best method of going after this trade he says is by means of window displays and with this end in view he arranges a showing of bathroom fixtures at regular intervals. At all times they are kept prominently displayed in his store. As a result of going after the trade in fixtures systematically he has trebled and quadrupled his turnover and demonstrated beyond any question of doubt that the business is to be had if the men in the trade will go after it.

Who Buys Them?

Who are the big buyers of bathroom fixtures? Mr. Minnes sales would indicate that practically everyone is a prospect. Home owners of course are especially interested. Those who are building new homes are equally as good prospects. But Mr. Minnes finds that he is selling fixtures at all seasons of the year and not always to home owners or builders. Very often a young man or woman will come in and ask for and buy a soap dish or a towel bar, a mirror or some other piece that has been on display. This happens not infrequently and

indicates that the younger members of the family take pride in the bathroom in their home and want to do their share of providing nice equipment for it. Not a few of these young people return from time to time and buy various other fixtures until they have everything complete.

Women Good Buyers

Mr. Minnes finds that a very large percentage of his stock of bathroom fixtures is sold to women. Quite often they are the housewives who are getting a complete set of fixtures for the bathroom as quickly as they can. Some of the women buy a whole outfit, but more often they buy one piece at a time until they have all.

Another big percentage of bathroom fixtures is sold to those building new homes. Mr. Minnes finds that it pays well to talk and show bathroom fixtures to every home builder.

Are Always Interested

"They are always interested," said Mr. Minnes. "Anything that is going to be of real service in the home and has a large utility value as well carries interest to the men and women who are building new homes. One has two big talking points right there and then there is a third that is not less important and that

is the reasonable price and the long and constant service the fixture will give."

Keeping the fixtures looking their best and out where people can see them all the time is the best way to keep them moving, Mr. Minnes says. One cannot be too careful about keeping one's stock presentable, especially when many of the customers are women. Many women have a dread of going into a plumber's shop that is induced by their having at some time or other seen quantities of dusty merchandise around. They are really interested and would like to go in and inspect the stock but hesitate to, fearing they will come out all over dust.

Will Tell Others

Once they find a store where they know they need have no scruples about entering, they not only come themselves but tell other women and much good business is the result.

Women, Mr. Minnes believes, are the prime movers of most sales in plumbing equipment and of labor saving devices for the home. They know what they want and sooner or later plan to equip their homes as they would like to have them. This of course cannot always be done at once, but Mr. Minnes finds that women who are interested in improving their homes are real prospects not only for bathroom fixtures, but for improved plumbing and heating and also for the

long list of electrical labor saving devices which he handles. In his window and store displays he is always careful to keep an electrical washer, a vacuum sweeper or some other labor saver out where it can be seen and many sales are directly traceable to interest aroused in this way.

Lets Them Know

It is good business to use newspaper space, Mr. Minnes says, to let people know where they can obtain merchandise. Good window and store displays backed by snappy advertising are a hard combination to beat from a sales standpoint, he says. His newspaper messages not only bring in the home people but reach out for miles and interest people in the surrounding district who would never see his window displays or hear of his store. He finds that home owners all over the country are alike interested in anything that will make their homes better or help them save time in their work. In hundreds of country homes bathrooms and other conveniences are now installed and the owner of every one of these is a real prospect for bathroom fixtures and as Mr. Minnes says: "the business is there all right if one will go after it."

Shows Them Off

A point that might help other men in the trade in arranging displays of bathroom fixtures is that in dressing his win-

"ALL THEY COULD ASK—AND MORE"

Editor, *Sanitary Engineer*:—

"This is to express our appreciation and thanks for the most excellent article and cut of our show room which appeared in your issue of May 1. It is all we could ask and more.

"Your representative certainly went into detail very minutely and there was very little which he did not see. Already we have received a letter from a firm in Dayton, Ohio, complimenting us on the layout.

"Again thanking you and wishing your excellent paper every success in the future,"

A. R. WILSON, LIMITED,

Heating, Plumbing and Roofing,

Sherbrooke, Que.

dows Mr. Minnes is always careful to use some dark material. This makes a striking and very effective background against which the all white or shining nickel fixtures stand out and in many cases practically "sell themselves."

Some such inexpensive material as black or purple crepe, or cloth is very effective.

With such materials it is also an extremely small matter for the merchant to arrange steps, pyramids or other settings which will enable the maximum amount of merchandise to be shown to the best advantage.

Mr. Minnes finds the step arrange-

ment very simple and effective and points out that one can easily make wide or narrow steps as the merchandise demands, and as many or as few as one likes.

While he believes in showing as wide a variety of merchandise as possible, he believes it is not good business to overcrowd a window as it spoils the general effect and makes it look as if the merchandise was thrown in.

His windows are changed every few days and he has proved by his sales records that it pays and pays well to do this.

Interior showroom view of the plumbing, tinsmithing, steam and gasfitting business of Hamilton and Stott, St. Thomas, Ont., showing how various plumbing and heating equipment is demonstrated. A combination coal and gas range, and gas ranges are shown along with laundry tubs, closets, basins, etc. Note how smaller bathroom accessories are shown in glass-fronted wall cases placed at convenient height for customers to examine. These cases have sold considerable plumbing specialty lines and these sales have frequently led to installations of bigger equipment.

Increasing the Volume and Profit Margin on Various Sheet Metal Work

Outgoing Dollar Based on Average Sheet Metal Job is Made Up of 37 Cents for Merchandise, 32 Cents for Labor and 31 Cents for Overhead—Furnace and Sheet Metal Work About Same—Ventilating and Special Sheet Metal Work Varies Somewhat

(Written by a sheet metal worker)

THERE are some of us conducting tinshops who have made a living and a profit out of them. Why? Because we have asked for a profit and insisted on getting that profit which is rightfully ours.

There are some who have made a profit by applying a smaller margin of profit on cost than their competitor. They have really increased their volume of sales but they have taken their competitor's profit.

There are some that have made a profit not by taking business away from their competitor to increase their volume with a small margin of profit but by applying the time saved by not having the increased volume, to construction details, labor, merchandise and expense.

We all feel that we have mastered the problems of the business. Now as a reminder of the fundamental principles of our business let us first recall the day you started. Do you remember when you opened your ledger that Capital, your investment, was there? Do you remember when you walked through the office door, "Expense" slipped in with you—and insisted on being your partner?

The Surplus

Men, representing tools and equipment, material, labor, productive and non-productive, appeared—and you gave them all a place in your ledger and when everything was arranged in tip top shape you found that you had a little left over and not to forget you found a place in the ledger and called it "surplus."

Then on looking around you found that you had four assistants, namely Investment, Merchandise, Labor and Expense, to run the business for a profit to make that surplus grow. In checking up your records of the past you will find that the four items mentioned have played an important part in all of your transactions for a profit, with the exception of now and then when you juggled the margin of profit; not because you wanted to take a job away from a competitor but to stimulate business and to keep your organization working to have an income to balance your expense, also known as overhead.

This practice is good business, but don't practise it on all of your estimates and don't compare your business with manufacturing concerns who base their

selling price from year to year on past costs, overhead included, but not including profit, knowing that greater efficiency of production and a larger volume of sales would bring in the profit.

We may say that this can be done in the sheet metal business as well as in the manufacturing and merchandising business providing we can increase the

WOULD BE WORKING IN DARK WITHOUT "SANITARY ENGINEER."

"As a reader of Sanitary Engineer I must say that I find it a very valuable paper. I am interested in many of the items and letters and general information. I find your price list and those articles on septic tanks valuable information. I would not be without Sanitary Engineer. If I dropped reading it now I would feel like one working in the dark."

William D. Ryan,

St. John's, Newfoundland.

efficiency of our labor. We can't consider volume on this basis and be on the level with our competitor.

Only One Way

There is only one legitimate way of increasing our volume and not interfering with our competitor's profit, and that is:—

1. Promote the sheet metal industry by using good materials and good workmanship.

2. Redeem some of the lost lines of the trade, especially cornice work.

3. Promote new lines for the uses of sheet metal.

4. And don't forget that a warm air furnace, properly installed, is a most satisfactory heating system for a home.

But before you can make it so, you will have to increase your present selling price and then see to it that the wall stacks are properly placed; all connections and joints throughout the system, gas, dust and air tight; a real tight joint between the registers, sheet metal and plaster; a fire pot and dome with plenty of room for combustion; a well balanced system of supplies and return. This will mean volume and a greater profit.

On the other hand, let us see what could be done with labor. Take our labor of to-day and put it along side the labor of fifteen or eighteen years ago.

Remember the big day's work, the good workmanship the old boys were used to? You shall have the answer.

Remember the tools they used, and the ones we have to-day?

We still have the same firepot, same snips, same hammer, same rope and pulley, same tar kettle, the same brake.

The only difference is they used to take care of the tools years ago—they were cheaper then they are to-day.

The only thing we haven't got any more is the old horse; in his place we have a flivver, increasing our efficiency in making the rounds to our jobs to see how little is being accomplished.

Now right here is where we can make a profit without reducing our competitor's profit.

But let us first make up the estimate.

First: We figure the quantity of the materials required, all as specified, and we set down merchandise at present market price, so much in dollars and cents.

Second: We estimate the labor required to the best of our judgment and past records of cost, and we set down, labor so much, in dollars and cents.

Third: Now that we have the labor it is quite easy to add the proper amount of expense based on our established overhead percentage and on the present expense budget, and we set down expense (or you can call it overhead), so much money. You can split this expense item and charge expense direct to job the same as merchandise and labor, and the balance as overhead; but the total should be the same in each case.

Now we have three items, the total of which will be the cost of the job.

But when we started the business, we had four items—investment, merchandise, labor and expense.

So far we have taken care of the last three items, merchandise, labor and expense.

The first item is the one that sets us in business and is yet to be considered, and we will therefore add a profit.

The amount or percentage is a question for you to decide. And so we set down, profit, so much money.

Now, we have taken care of all four

items and the total is our selling price.

After signing the contract we start in to take up the matter of details. Details of construction, merchandise, labor and expense, and whatever can be saved on the estimated cost is clear "velvet."

The best way to dispose of this "velvet" is to distribute same to the parties directly responsible for it, including labor, you putting your share in your pocket along with the others, and the profit will go to surplus.

This method of ignoring the velvet in relation to your cost will prevent you from using a too low cost in your next estimate, and you retain the chances for more velvet, as well as protecting your competitor who may not have the efficiency at his command that you have.

But by playing fair you will be able to get his volume of business which he should have, at a profit.

There are several points that I want to bring out strong. They are:

1. Size up your capacity when deciding on the volume of business that you want to handle.
2. Remember this roofing and sheet metal business is limited.
3. There is a point in every business

"A BIG HELP TO TRADE"

"I am very much interested in your articles concerning the building of septic tanks. The cuts and the explanations are a good help to the trade."

Alfred L. Wael, Maniwaki, Que.

when the maximum point of profitable return is reached.

Translate your business into terms of one dollar.

This will put life and speech into figures so that they can fulfill their true mission of telling you how your affairs are going.

There are one hundred cents in a dollar, and you should know exactly where every cent in every dollar of income went.

This will tell you at a glance how many pennies there are required to bring in a dollar.

It will tell you at a glance by comparing figures in connection with previous months or years, what items have cut into your profit, or what items have increased your profit.

Outgoing capital, or work in process, consists of the cost of merchandise, labor and expense and is charged directly to the contracts or jobs.

The overhead here represents 95 per cent. on labor.

These three items are the cost of the job and your outgoing dollars.

This outgoing dollar is based on the average roofing and sheet metal job and is made up of 37 cents for merchandise, 32 cents for labor and 31 cents for overhead.

Offhand, I would say that the furnace and general sheet metal business will stack up about the same.

I believe that ventilating and special sheet metal work will figure to 21 cents for merchandise, 45 cents labor and 34 cents overhead.

Anyone of you may have the correct figure by checking up your own records.

Here we have Expense as one item.

This item can be split up just as you see fit, and freight, if any; trucking; probably non-productive labor and other items that are not productive labor or productive merchandise, can be charged

Steam, Vapor and Hot Water Heating

Simple Examples and Experiments—Methods of Making Connections—Why One Inch Pipe is Basis of All Heating Calculations in Arriving at Amount of Radiation Required

Written for Sanitary Engineer by EDWIN NEWSOME, Consulting Engineer
(Article No. 3 of Series)

IN A previous chapter reference was made to the size of pipe used as a basis on which to compute radiation. When, according to climatic conditions, the heat loss of a building is set at say 7 per cent. and a building contains 30,000 cubic feet of space to be heated, 300 times 7 would give us 2100, representing 2100 feet of one inch pipe. To find out the number of square feet of heating surface, divide 2100 by 3, which gives us 700, meaning 700 square feet of radiation.

Now let us analyze the reason, or one of the reasons why one inch pipe is used. First it is well to note the area of a one inch pipe, 36 inches long and the volume of steam or the quantity of hot water to fill such a length of one inch pipe.

The outside diameter of one inch pipe is 1.315; the circumference 4.133 inches. Then 36 inches would be equal to a piece of sheet iron about $148\frac{3}{4}$ square inches. One foot of heating surface contains 144 square inches.

Now, as to the carrying capacity of one inch pipe. The inside diameter is 1.049 inches, the inside area is 7854 square inches and 36 inches of one inch pipe would therefore hold 22.2744 cubic inches, by measure equal to about 17 fluid ounces. Let us now compare the above figures with a piece of two inch pipe.

The area of two inch pipe is 3.141 square inches. Outside circumference is 2.375. Therefore to procure one square foot of heating surface from two inch pipe a piece $19\frac{1}{4}$ inches long would be required, and $19\frac{1}{4}$ lineal inches of 2 inch pipe will hold 60.464 cubic inches, approximately $60\frac{1}{2}$ cubic inches of either steam or hot water. Therefore the reader will see at a glance that a great deal more steam would have to be

furnished to fill a piece of 2 inch pipe giving one square foot of radiation than a piece of 1-inch pipe giving the same amount of heating surface.

Old One Gave More Heat

It is strange, but nevertheless true, that the old one inch pipe coil gave off considerably more heat than many more recently designed radiators. At the same time, the box coils were and are dust collectors, unsanitary, cumbersome and not so reliable from the standpoint of durability.

The strides made of recent years with heating specialties, reflect great credit to inventors. Coal is giving a greater degree of service in B. t. u.'s as a result of these steam heating specialties. Hot water heating too has not been entirely left alone, though few heating engineers are there who take the interest they ought to in developing hot water heating.

The old gravity job holds sway, though not because of its perfections. It stands just in the same position as it did in the time of Sir Isaac Newton. A few "heat generators" have come and gone and it still remains for someone to invent a "foolproof" apparatus that will not finally lose its effectiveness. Every once in a while some one patents another fuel saver. But one strange thing about such apparatus is that the term "generator" is given to them, when as a matter of fact the boiler or furnace is the actual heat generator. The main trouble with "heat generators" patented of late, has been found to have been caused by the valves either becoming clogged or dirt getting under the spring valves or weights, thus making the "generators" of no value. Pressure caused by the water expanding has been permitted to escape.

The heating of buildings by steam is said to have been one of the first meth-

ods adopted and for many years no one attempted to install any but a two pipe system. Later someone evolved the idea that so long as the air could be forced out of a system of coils or radiators a one pipe system was all that could be desired. As a matter of fact, the two pipe system (badly installed) was the outcome of the one pipe jobs.

Two pipe installations fitted with impractical air vents, or with pipes connected up in such a way as resulted in water hammering; also creating conditions where the water would collect in the radiation, all brought about the need of some changes in steam heating systems. At the same time the using of a poorly designed steam radiator was the chief trouble.

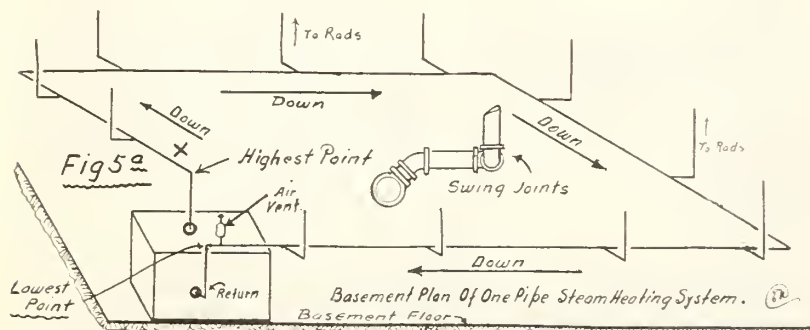

What is known as hot water radiation such as permit a connection being made as shown in Fig. 7 would no doubt eliminate 80 per cent. of the troubles experienced with the average two pipe steam system. And if our readers will watch closely all modern steam installations they will find that the connections at the radiators are made as in Fig. 7.

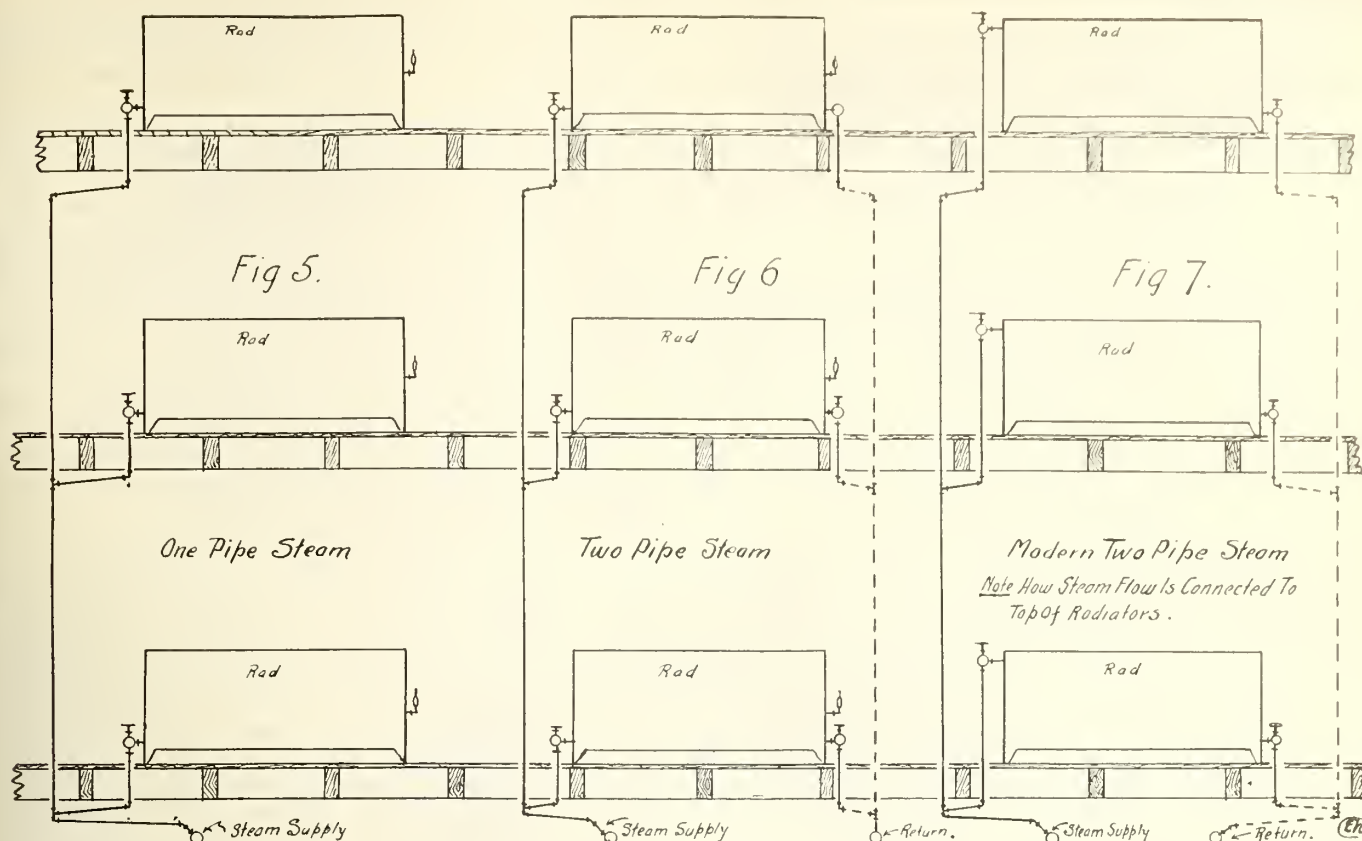

The same could almost be said of hot water radiation. The twin connection is largely impractical. Even the hot water heating specialty engineers almost invariably adopt the top and bottom connections and all forced hot water heaters are so connected.

Falls to Lowest Connection

The student in heating engineering should just give a little thought to the theory that no matter what medium be used for heating, steam or hot water, as soon as it cools, falls to the lowest connection.

For example turn to Fig. 5. This sketch shows the connections made in a common one pipe steam system. The

steam passed from the horizontal flow to one or more vertical risers and the condensate must return back and down the vertical pipe which also conveys the steam to the radiator.

Fig. 5-A shows a plan of steam mains from the top of the boiler to the vertical risers, and from point marked X the horizontal pipes pitch down. Note how the end is connected at the boiler. Fig. 5-B shows how some engineers have been known to connect the piping at the boiler. All with a view of lowering the price of the installation, at the cost of efficiency. One wonders how such jobs work at all, but strange to say many of them give fairly good satisfaction.

Fig. 6 shows the proper way to connect up radiators on a two pipe steam heating system. The radiator sections are connected top and bottom with either slip nipples or right and left threaded nipples. The steam enters the top and as the heat is radiated, the steam condenses and forms water beads on the inside of the radiators. The condensate also cools on its way down to the return pipe, thereby giving off all possible heat in both steam and the hot condensed water.

(To be continued)

WINNIPEG HEATING SYSTEM IS CIVIC ISSUE

Winnipeg.—Among the questions likely to figure prominently at the next civic election is that of a central heating system for the business section of the city, to be operated in conjunction with the hydro's standby plant. It has been

ONLY PAPER TO CARRY KENNEDY ADDRESS

Editor, Sanitary Engineer,
SANITARY ENGINEER,
Toronto.

I wish to congratulate you on the May 15 issue of your paper, because it contains such a splendid report of the Convention.

I was glad you reported an address by Mr. Kennedy, who spoke at the Ontario Convention. I found his address very interesting, and I am glad good old Sanitary Engineer reported it, because I have not seen it in any other paper.

Robert Thompson.

anticipated all along that the question would come up for discussion at an early date, and a foreshadowing of this was made by Alderman Heaps, chairman of the public utilities committee, at the latter's meeting.

The alderman stated that J. G. Glasco, manager of the hydro, was preparing for each member of council a digest of the voluminous Skinner report, made last year by W. E. Skinner, consulting engineer of Minneapolis, into the question of central heating in Winnipeg. The report recommends the inauguration of the system.

PLUMBING SUPPLIES BASEBALL LEAGUE

The Crane Co. Ball Club went into first place in the Plumbing Supplies League by virtue of their five-to-four victory over the Standard Sanitary team at Willowvale Park. Both pitchers were in good form, Patterson having eight strike-outs and allowing four hits and two walks, while Richards got nine victims, but walked four batters, which proved costly to him. The score:—

	R.H.E.
Standard Sanitary	2 0 0 0 1 1—4 4 2
Crane Co.	3 0 0 1 0 1—5 3 2

Batteries—Richards and Cooper; Patterson and Coulter.

Umpire—F. Hallinan.

PETERBORO HOUSES ARE BEING MODERNIZED AND PROVIDED WITH CONVENIENCES

Peterboro, Ont.—That Peterboro has more houses without sewer connection than any other city is the sweeping statement made by Plumbing Inspector A. G. Metherall.

Two years ago there were 1,350 dwelling houses in Peterboro without sanitary conveniences or sewer connections, whereas in Toronto at that time there were only 350 and in Winnipeg only 400. During last year there were 128 of these unsanitary houses modernized, and up to date this year 38 have had sewer connections installed. A determined effort is being made, the plumbing inspector said, to bring Peterboro up to the standard of other cities in this respect.

Some New Blood

IT IS indeed unfortunate that there is little likelihood of a convention of the Canadian Society Domestic Sanitary and Heating Engineers being held this year. This convention was passed up last year and this therefore makes two years in succession when the sanitary and heating industry of Canada has failed to speak as a unit. It is true there are difficulties in the way of conducting a national convention in Canada. The long distances which representative delegates would have to travel make it well nigh impossible for national representation, but it will be a pity if the matter is allowed to drop entirely because some plan of operation could be decided upon which would enable the organization to function.

The solution of the matter would seem to be in the strengthening of local plumbing and heating organizations in the towns and cities throughout Canada, these to be represented as fully as possible at provincial gatherings. The question of how a national organization can be made to function could then be gone into. Perhaps such an organization would be better conducted merely by executive officers from the provincial organizations meeting together, expenses to be paid by the provincial bodies.

The lack of any unified leadership and inability for the plumbing and heating industry of Canada to speak with one voice on important national matters, is having its effect upon provincial organizations, and the only type of organization which seems to be thriving to any extent in this industry to-day is that found in the smaller towns and cities. A number of such organizations have sprung up to help improve trade conditions and now they find the need for broader representation in the provincial and national fields. Why can they not have it?

Some new blood among the officials of some of these organizations might go a long way to remedying the situation.

Drive Should Be Continued

THE Board of Health of Peterboro has ordered the owners of six local houses to have their property connected with the city sewerage system as soon as possible.

A good many orders of the same kind will be necessary, it is said, before Peterboro can pride herself upon being completely modernized so far as sanitary conveniences are concerned.

Plumbing Inspector Methers declares that Peterboro is much worse off in this respect than most other Canadian centres.

Two years ago there were as many as 1,350 houses in Peterboro without modern sanitary conveniences, whereas at the same time Toronto had only 300 and Winnipeg 400.

Last year some progress was made towards remedying the situation, for conveniences were installed in 128 houses, and so far this year 38 more dwellings have been connected with the sewer.

The drive should not stop until every house in Peterboro and every other such city where sewer facilities are possible, has been linked up to the system.

An easy method of paying for the work has been devised in many cases and in the interest of the community generally the Board of Health should insist upon these very necessary improvements being adopted wherever there is need of them.

Property owners who, after due notice, ignore the commands of the board should be checkmated by a declaration that their houses are unfit for habitation.

Public opinion will support the health authorities in any action of that kind they may be called upon to take.

A clean city in every respect should be the community aim, and there is no more essential step than to have the sewerage system as completely efficient as possible.

More Favorable to the Trade

THE changes brought about in connection with the tariff and taxation, as outlined in the amendments appearing elsewhere in this issue will have the effect of easing the load somewhat for all branches of trade. The decision to postpone the application of the new sales tax until January 1, 1924, will give more time for the trade to make preliminary adjustments, and the change will then come at a time when many firms are ending their financial years and when inventories are being taken in the ordinary course. With the new tax applied at midsummer, as was previously provided, and in view of the plan whereby rebate would be allowed to manufacturers for stock on hand, it was quite evident that many firms would have been put to a great deal of trouble to make a physical inventory at that time of year. The tax already causes enough upset in business without bringing on such a further burden in midsummer when staffs are generally reduced owing to holidays. The change will be much welcomed by the trade.

The decision to tax receipts in the form of postcards, form letters and ordinary letters from the date of the enactment of the Bill, will bring about a considerable change in the business policies of a number of plumbing firms who have been using this form of receipt since the Receipt Tax came into effect. While, generally speaking, the Budget as amended is not unfavorable to business interests as a whole, this is one of the minor points where a little forethought might have saved much confusion and expense to business concerns. It evidently was not figured that the use of postcards and letters as receipts would extend as far as it did when these forms were exempted from the sales tax. Special forms were printed by firms in various parts of the country for sale to business houses wishing to use this form of receipt, and now after considerable money has been invested in such forms, they are to come under the heading of receipts subject to taxation.

The postponement of the sales tax will delay for a few more months the revision in plumbing prices which a number of firms were already figuring on. It has also had the effect of cancelling many orders for July delivery which wholesalers and retailers had placed with manufacturers since the Budget announcement was made, this practice being followed in order to take advantage of the 2 1-4 per cent. tax compared with the higher tax of 6 per cent. which was to have become effective on August 1. Such merchandise will now be delivered in the usual way and ease the strain which was commencing to develop in a number of lines of plumbing manufacture.

MINUTE MESSAGE

Number Thirteen

Written for "Sanitary Engineer" by FRANK STOCKDALE

General Selling Series

Your Window is a Picture, Too

"Get 'em up! Get 'em up!"

Thus spoke a progressive plumber as he stood before his store window directing his window trimmer.

It was good advice that he gave in those three short words—"Get 'em up!" They carried real selling power behind them.

Your windows are bought and paid for as a part of your rent. To get this investment back and a profit as well, you must make your windows an attractive picture—one which is pleasing—one which is a welcome to your customer. Put the goods up where he can easily see them.

Put your "leaders" on a level with the eye and not too far away. A few articles well placed will be more effective than many articles poorly placed.

Notice the 5 and 10c stores. They buy the best locations they can secure and then use their windows to sell their goods. And—they "Get 'em up." This is proof of the value of window display properly arranged.

"On a level with the eye and upright" is a phrase which your window trimmer should carry with him constantly.

Have him preach it—have him practise it. Make your window earn more profits.

THINK IT OVER—APPLY IT TO YOUR BUSINESS

News Notes From Coast to Coast

Doings in the Plumbing and Heating Industry

NEW FIRMS

W. H. Murat has commenced a plumbing and tinsmithing business at Provost, Alta.

BUSINESS CHANGES

Weyburn, Sask.—J. C. Stewart announces that his plumbing and heating business is now in charge of George Kalman.

OPENS NEW SHOP

St. John, N. B.—G. W. Williams has opened a plumbing supply store on Main Street in St. John, near St. Luke's Church.

PLUMBERS FORM PARTNERSHIP

St. John, N. B.—Crawford and Hooper, have formed a partnership to conduct a plumbing and heating contracting business in St. John. A store and office combined has been opened on Union Street, St. John.

IN NEW PREMISES

Campbellton, N. B.—Alex. Damboise of Campbellton, plumbing and heating contractor, is now located in the McDonald Building in Campbellton. Besides his plumbing and heating business, Mr. Damboise is agent for Campbellton territory for the Gilson pipe and pipeless furnaces.

WELLAND PLUMBERS' DISPUTE SETTLED

Welland, Ont.—Welland master plumbers and the journeymen plumbers have settled their wage dispute. The men are to get 85 cents an hour, half the increase they asked. Last year's rate was 80 cents and the men asked 90 cents this year. The journeymen also asked time and a half for the first three hours overtime with double time after that, also double time for all holidays and traveling pay and expenses for out-of-town jobs.

IMPERIAL RADIATOR CO. PLANT IS BUSY

On the first visit to the plant of the Imperial Radiator Company in St. Catharines since the recent change by which this company takes over the premises formerly occupied by Steel & Radiation Ltd. Through the courtesy of General Manager E. T. Wingate and Plant Superintendent W. H. Davis, the representative of Sanitary Engineer made a complete inspection of the entire plant, viewing with much interest the various processes of manufacture and testing of boilers and radiators. This firm's activities indicate the expectation of a big

season. The whole plant is in full operation and the management have optimistic feelings concerning the future of this line of business in Canada.

OBITUARY

Robert F. Elliott, Elliott Bros., Kingston, Ont., is dead.

CANADIAN GAS ASSOCIATION

The annual convention of the Canadian Gas Association will be held August 23-24 in Ottawa.

CONTRACTS AWARDED

John Ritchie Ltd., Toronto, has plumbing and heating contract worth \$3,500 for York Township Municipal Hall.

RECOMMEND NEW SANITARY INSPECTOR

Oshawa.—The Board of Health passed a recommendation which will be forwarded to the Town Council asking that Alexander Kelman of Caledon, Ont., be appointed sanitary inspector to fill the position made vacant by the resignation of F. C. Palmer. The recommendation requested that his duties commence on June 1 at a salary of \$1,400 a year.

Dominion Radiator & Boiler Co. Formed

Dominion Radiator and Boiler Company, Ltd., is the name of the newly formed company organized to take over the Dominion Radiator Co., Ltd., Toronto, and the American Radiator Company of Canada Ltd., with factory in Brantford, Ont.

The new company's head office will be in Toronto. The entire assets and liabilities of the two former companies have been taken over by the new concern. Manufacturing plants are being operated at Toronto and Brantford and the new company will continue to produce Peerless and Safford radiation together with Ideal, Arco and Mogul heating boilers. Distributing warehouses are maintained at Halifax, Montreal, Toronto, Brantford, Windsor, Winnipeg, Calgary and Vancouver.

H. N. Leadbetter, formerly of the American Radiator Co., is president of the new company and is the Canadian Director in the combined organization. The directors of the former Dominion Radiator Co., while retaining stock interest, are retiring as directors, the directors of the American Radiator Co. directing the new concern.

WOODSTOCK PLUMBER RETIRES

Woodstock.—E. S. Coppins, who has been in business continuously in Woodstock for the past 33 years, has announced his intention of retiring from business. He is a plumbing, electrical and heating contractor.

MOVES TO NEW PREMISES

St. John, N. B.—Joseph Noble, who has had his St. John office on North Market street, is now located in more desirable quarters on Germain Street, in the Market Block. Mr. Noble, for many years maintained an office on King Square.

MAY ERECT COMFORT STATIONS

St. John, N. B.—The city of St. John may erect convenience stations containing toilets and urinals and wash rooms during the coming summer. St. John is one of the few cities of fifty thousand and over that are without convenience stations, or comfort stations as they are also designated.

INSPECTING PREMISES

St. John, N. B.—Chief George Blake of the St. John fire department, who is also one of the best known master plumbers in the maritime provinces, is now making his regular inspection of premises in the city with a view to eliminating fire hazards.

ISSUED THIRTY-ONE PLUMBING PERMITS

Peterboro, Ont.—Plumbing permits to the number of 31 were issued by A. G. Methers, City Plumbing Inspector, during the month of April. Inspections numbered 104, including 32 water tests; 19 smoke tests; 16 layouts and 37 miscellaneous tests.

The permits were for—19 water closets; 14 baths; 14 basins; 15 sinks; 2 laundry tubs and 2 soda fountains.

PURDY MANSELL CO. COMPLETE ST. CATHARINES CONTRACT

The new St. Catharines Collegiate Institute, recently completed on Catharine street, in that attractive city, is said to be one of the finest school buildings on the continent. The heating equipment represents a complete installation of Imperial Radiators, manufactured by the Imperial Radiator Co., St. Catharines, and installed by Purdy Mansell Co., Toronto. Upwards of 25,000 feet of radiators is installed in this building.

AMEND PLUMBING BY-LAW

Amendments to the present York township plumbing by-law were submitted to York Township Council by Acting Chief Inspector Beeston and approved. The clerk was instructed to prepare a by-law to cover same. Master plumbers present were in accord with suggestions presented by Mr. Beeston. In future township plumbing inspectors must qualify before an examining board. The clerk was instructed to advertise for inspectors at once.

SANITARY INSPECTOR LECTURES FARMERS

Fort William, Ont.—At the annual meeting of the Fort William District Municipal League held in Fort William and attended by over fifty farmers, A. J. Bolus, sanitary inspector for the city, gave a very interesting paper on rural sanitation giving a description of the method of installation and working of the septic tank system. Following the meeting several of the farmers met Mr. Bolus and requested more details. They told him they were greatly interested and wanted more knowledge with the idea in view of installing plumbing in their own farms.

PLUMBER'S INJURIES SUBJECT OF LEGAL ACTION

Judgment was reserved by Mr. Justice Smith, Toronto, in the action brought by the Board of Education and Robert Miller against the Monarch Brass Manufacturing Company for \$15,000. Miller, who was employed as a plumber's assistant by the board, was sent to the defendant's factory on February 6, 1922, to secure a siphon which had been left for repair. He went to the second floor and obtained the siphon, descended to the first floor and walked through a loading door which opens into space. He fell one story and suffered a fracture of both ankles and the right leg.

FORT WILLIAM PLUMBER GETS BIG CONTRACT

Fort William, Ont.—At Mount, ten miles west of Port Arthur, the Canadian National Railway is establishing a terminal yard and repair plant, that when completed will be one of the largest on the continent. There are to be several large bunkhouses, an engine house, machine shops, car repair sheds and a hundred and one other departments and into all these must go considerable plumbing and sanitary fixtures. The J. J. Culliton Co., of Fort William, has been notified that it has received the contract for this work. Forty fixtures are to be installed, in addition to the laying of miles of equipment. Most fixtures are specified in the contract. A septic tank with an Anthes syphon trap and a sub-surface absorption area will be installed for the disposal of sewage. This job amounts to several thousands of dollars.

**A. C. Leslie & Co.
Honor W. S. Leslie**

MONTREAL.—A very pleasant evening was spent at the Mount Royal Hotel, Montreal, when the sales staff of A. C. Leslie & Co. Limited were entertained at an informal banquet in honour of their president, W. S. Leslie, who has returned from a four months' business trip to Great Britain and the continent. The chair was taken by Thos. H. Jordon, vice-president, supported by Geo. B.

W. S. LESLIE,

President A. C. Leslie & Co., Ltd., Montreal, who was honored at a banquet by the staff of the company on his return from business trip abroad.

Ball, manager of the Toronto office. After doing full justice to the many good things provided and the toast to the King had been duly honoured, the chairman referred to the pleasure experienced by all on the return of Mr. Leslie, and the manner in which the toast to his health was received by those present testified to the esteem and respect in which Mr. Leslie is held by the whole staff. In acknowledging this reception Mr. Leslie referred to the pleasure which he and his family experienced on returning home despite a very pleasant visit to the other side. Mr. Leslie then gave a very interesting account of his trip which covered all parts of England and Scotland and his remarks were not only interesting but very helpful and illustrative from the point of view of those connected with the iron and steel trade. (An interview with Mr. Leslie appears elsewhere in this issue giving his views on conditions in the old land.) Addresses were also given by F. B. Leslie on present conditions in the U. S. A., E. H. Copland, secretary of the company, and others. Music and other entertaining features

contributed to the enjoyment of the evening and the proceedings terminated with a hearty vote of thanks to the committee in charge of the affair.

TENDERS FOR LAVATORY

Sealed tenders will be received by C. H. Acton Bond, 4 Wellington St., E., Toronto, until noon, Monday, June 12th, 1923. One-story lavatory at Queenston Heights Park, 25 x 64. Bulk tenders will be received for all trades, or bulk tenders for masonry, carpentry and plastering, and separate tenders for painting, tinsmithing, plumbing and electric wiring.

KAMLOOPS PLUMBING AND HEATING CO. TO DO CEMENT CURB AND GUTTER

Kamloops, B. C.—A special meeting of the city council was called as a result of which the contract for the cement curb and gutter on both sides of Victoria Street, between Third and Fourth Avenues, was let to the Kamloops Plumbing and Heating Company at the figure of \$880. There was only one other tender, that of Johnstone & Co., the amount of which was \$1,156.

Following up his protest against this work being done, when "certain cesspits all over the city were over-flowing," Ald. Gleave dissented from the action taken, declaring again that as long as necessary sewer extensions were imperative, such a "luxury" as this cement work could well wait.

CANADIAN SOCIETY CONVENTION STILL HANGS FIRE

Montreal.—The question as to whether the Canadian Society of Domestic Heating and Sanitary Engineers will hold a convention this year or not, still hangs fire but as was intimated in the last issue of Sanitary Engineer the likelihood that a convention will be held is very slight.

Following the scant response received by Secretary D. K. Trotter to his questionnaires sent out to all provincial organizations, the sub-committee decided to meet in this city on May 17 to finally dispose of the matter. For various reasons it was found necessary to postpone this meeting until Thursday, May 31, results of this latter conference not being available at the time of going to press.

However, from expressions of opinions received from members of the sub-committee the action to be taken is fairly certain. Montreal officials do not feel it fair either to them or to the association at large to go to the expense and trouble of holding a convention if it is to be merely a local affair and not truly representative of the national scope of the Canadian Society of Domestic Heating and Sanitary Engineers.

If it is decided not to hold the convention, which had previously been tentatively fixed for this city early in June, this will be the second consecutive year that the society has not met in general convention.

WALKERTON CONSIDERING CENTRAL HEATING PLANT

Walkerton, Ont.—The property committee of Walkerton town council are considering the installing of a central heating plant for the county buildings. At present six boilers have to be used with hard coal, whereas by the central system one boiler, using soft coal, would answer the purpose. They are asking for tenders on the job.

WESTERN ONTARIO NEWS

Battler and Frieburger of Kitchener, Ont., expect to be located in their new building in a few weeks.

Bowman Bros. of St. Catharines, Ont., have contract for new plumbing in large home being remodelled for G. J. Inksater.

Noble and Rich, London, Ont., have been awarded a contract for heating and plumbing for new \$10,000 home for Bert Weir.

J. W. Peart of St. Catharines, Ont., has been awarded the plumbing and heating contracts for library building at Merritton, Ont.

George Russell of Mount Forest, Ont., has moved to new and larger quarters in the premises formerly occupied by the Representative.

William Skelly of London, Ont., has been awarded plumbing and heating contracts for new \$75,000 warehouse for the Fireproof Warehousing Co.

Dr. Clifton Pennicott, 430 Hamilton Road, London, Ont., wants prices on hot water heating, plumbing and electrical work for new \$10,000 dwelling.

Brooks and Graham of Fergus, Ont., have been awarded the heating, plumbing and tinsmithing contracts for new parsonage to be erected by the Methodist congregation.

Lloyd Holland, 404 Hamilton Road, London, Ont., want prices on hot water heating, plumbing and electrical work for block of stores and apartments to cost \$20,000.

Architect W. G. Murray, Dominion Savings Building, London, Ont., wants prices on hot water heating, plumbing and electrical work for new \$20,000 home to be erected for R. H. Dowler.

Architect W. Stuart Pavey, Standard Bank Bldg., London, Ont., is preparing plans for two residence to cost \$15,000 for E. C. Warren, 20 Somerville Gardens, Toronto. Prices will be wanted on hot water heating, plumbing and electrical equipment.

REVISED BUDGET

(Continued from page 13)

cheques \$1.00 instead of \$2.00 as formerly. This is to be put into effect from the date when the bill is assented to.

Another important amendment of interest to the sanitary and heating industry is that dealing with deductions to be allowed on account of sales tax in certain cases, as follows:

Deduction of Sales Tax

"A deduction on account of the sales tax may be granted in respect to goods sold at a price fixed by bona fide contract of sale made before May 12, 1923, and still in force at the time of delivery of the goods; provided that such deduction shall not exceed the difference between the amount of the sales tax calculated at the rate in force on May 11th, 1923, and the amount of the sales tax paid or to be payable under these provisions and that no such deduction shall be made in respect of goods delivered after March 31, 1924, and claims for such deduction must be presented to the Department of Customs with complete evidence on or before June 30, 1924, otherwise same will be rejected."

The item concerning well-drilling machinery, which has been put on the free list, is as follows:

Well-drilling machinery and apparatus, and parts thereof, of a class or kind not made in Canada, drawn or seamless iron or steel tubing over four inches in diameter, for drilling for water, natural gas and oil, and for prospecting for minerals, not to include motive power.

Coal on Free List

Coal, anthracite and lignite; anthracite and lignite dust; coke, are now on the free list.

Emery wheels, carborundum wheels and stones, manufacturers of emery or of carborundum are charged duty as follows: Br. Pref., 17½%, Intermediate, 22½%, General, 25%. Carborundum wheels or stones not further manufactured than moulded and burned, Br. Pref. 10%, Intermediate, 12½%, General, 15%.

INCREASING THE VOLUME

(Continued from page 25)

directly to the different jobs under Miscellaneous Expense to jobs.

And the balance of the overhead can be charged as shown here. But inasmuch as the cost of the job will be the same, it will be less work to charge the expense in one lump sum, based on your

percentage of overhead on your productive payroll or on the hour basis as you wish.

The monthly distribution of the expense should be charged in proper proportion to finished work, or cost of sales, and to work in process.

The monthly distribution of your expense to the individual jobs while in process is misleading.

That is, if it is done for the purpose of estimating your profit, unless you positively know that your overhead is in line with your budget and expense units and that you have the required volume of work in process and that all your jobs will at least pay their proportion of overhead.

Otherwise you simply are temporarily burying your overhead in the cost of your large jobs in process, until such a time when you wake up to the fact that the full amount of the contract is taken up in merchandise, labor and expense, and the contract is only three-fourths complete, and you only have three more months left in the year to finish up the year's business.

The way you have charged your jobs during the first nine months of the year, you have shown a profit, but you haven't any other big jobs in process to which you can charge your overhead for the last three months.

You will therefore have to turn to your book profits to pay for the cost of the jobs that are to be finished—jobs that did not pay the proportion of overhead.

But on the other hand, if you have other large jobs in process, you can keep on going, burying your overhead in these jobs, at the same time showing a book profit, or in other words, you are jumping from limb to limb.

But what are you going to do when there are not any more limbs to jump to? Then you will have to lay the cards on the table.

The remedy for this is a good book-keeper.

(To be continued in next issue)

BOARD OF PLUMBING EXAMINERS APPOINTED

The board of plumbing examiners as appointed by the Port Arthur City Council consist of J. W. Barnes, Chairman, and R. A. Shaw representing the master plumbers and W. Kirkbridge and Matt McArthur, the journeymen. The board met recently and elected Mr. Barnes, chairman. A. Peckett, building and plumbing inspector of the city, is ex-officio by virtue of office.

"Sanitary Engineer," the Paper That Publishes All the News While it is News

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

FIRMER tones are noted in the prices of most lines of goods which are of interest to the plumber, steamfitter and sanitary engineer. Advances in price have been more frequent than declines during the past two weeks. The advance in soil pipe should be noted, as well as the advance at some centres of boiler plate and wrought iron, malleable and cast pipe fittings and tinner's machines.

The ingot metal market has had a steady downward tendency for some time now, copper, tin and lead being the metals affected strongly. The markets are not strong in these lines, but, up to the

present, the effect of this downward trend in prices has not been felt on the finished product, to any great extent.

The iron and steel markets are still firm, a few small advances having occurred on some lines of commercial bars, but in some centres a decline is looked for in the near future, as a result of very high production in steel and iron, and at present, what appears to be an insufficient market to dispose of the very heavy production.

Merchants from all centres report that business is gradually becoming better steadily each week, though there is room for improvement yet.

Montreal Markets

MONTREAL, May 31.—A generally firmer tone is noticed in trading in all lines during the last two weeks, an activity which would have been about one month earlier all around had it not been for the lateness of the spring. In some lines even yet, buyers seem wary and are holding off, though other lines report brisk trading.

Price changes are very few, the recent upward move appearing to have reached a limit fixed by similar tendencies in primary markets where the recent advance in some cases has been followed by a sharp decline. It is of interest to note, however, that the main price revision in this week's list, is in the upward direction, discounts on pipe fittings having been reduced on a scale varying from two and one-half to five per cent. The tone of primary metal markets is also being felt in the scrap market where slight advances are noted in copper, boiler plate and wrought iron and fractional declines in lead and zinc.

EAVES AND CONDUCTOR STAY AT FORMER LEVELS

Montreal.

There are no signs of any change in the prices of eaves and conductors in the local market. Though the season has been late, trading is now reaching its usual summer levels and is reported firm from all sources. The quotations current on the local market are as follows:

EAVESTROUGH—

O. G. round and half round, per 100 ft. 3 in., \$16.90; 10 in., \$18.70; 12 in., \$22.20; 15 in., \$35.50; 18 in., \$45.00.

O. G. Square bead, per 100 ft: 8 in., \$15.90; 10 in., \$17.70; 12 in., \$21.20; 15 in., \$34.50; 18 in., \$44.00.

Discount 65 and 5 per cent.

CONDUCTOR PIPE—Round, Plain and Corrugated, per 100 ft.: 2 in., \$18.40; 3 in., \$22.30; 4 in., \$29.60; 5 in., \$48.00; 6 in., \$58.80.

Discount 65 and 5 per cent.

CONDUCTOR ELBOWS—

Plain or corrugated, price per doz 2 in., \$5.25; 3 in., \$6.00; 4 in., \$10.50; 5 in., \$24.00; 6 in., \$29.00.

Discount 65 and 5 per cent.

FURTHER IMPROVEMENT NOTED IN COTTON WASTES

Montreal.

Increased business in the cotton wastes market continues to be noted during the past week. Prices remain unchanged from the levels established this spring, as follows:

COTTON WASTES—

	Per lb.
Cream polishing	0 24
White, XXX extra	0 20

F.o.b. Toronto and Montreal.

SCRAP METAL PRICES FOLLOW PRIMARY MARKET TREND

Montreal.

Considerable activity is shown by the scrap metal market this week, particularly in the matter of price changes, several metals being announced at new levels. Following the recent decline in lead and zinc in primary markets both these metals have eased off fractionally while copper has advanced half a cent. Wrought iron is \$3.00 per ton higher and boiler plate \$2.00 per ton. Trading is reported to be fairly good, though not so well as should be the case at this time of the year. Local quotations are averaging as follows:

SCRAP—

Automobile Tires	0 50
Rubber Shoes	0 02½
Yellow brass	0 07½
Red brass	0 10½
Light brass	0 05
Scrap zinc	0 05
Lead, heavy	0 05
Lead, tea	0 03¾
Light copper	0 10½
Heavy copper	0 13¾
Wrought iron, R. Rd. No. 1 per gr. ton	15 00

Boiler plate	14 00
No. 1 machinery cast.....	24 00

CORRUGATED SHEETS ARE MOVING AT GOOD PACE

Montreal.

Corrugated sheets are moving at a good pace in the local market, and with navigation now open will show increased improvement as the season advances. The quotations now in force here are as follows:

CORRUGATED SHEETS—

	Per 100 sq. ft.
No. 28 gauge	7 00
No. 26 gauge	7 50
No. 24 gauge	10 00
No. 22 gauge	12 50

No. 18 gauge	19 00
Less 10 per cent.	
Lighter than 24 gauge and wider than 27 in.,	
75 cents per square extra.	

ENAMELED WARE SHOWS SIGNS OF IMPROVEMENT

Montreal.

Sales of enameled ware show signs of improvement in the local market during the past fortnight, prices remaining at the following levels:

ENAMELED WARE—

Sinks, flat rim—	1 only	2 only	3 only
16 x 24	\$ 7 50	\$ 7 40	\$ 7 30
18 x 30	8 70	8 60	8 50
20 x 30	9 90	9 80	9 70
Bath tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide			51 40
Bath tubs, 5½ feet,			57 10

Lavatories—

18x24 in. Apron F154 or P3845 or P3847	23 60
18x21 in. Apron F169 or P4205.....	17 60
17x19 in. Roll rim. F241 or P4345.....	12 60
Less 30 per cent.	

METAL LATH QUOTATIONS ARE AT SAME LEVELS

Montreal.

The firm state of the metal lath market reported in the last issue still continues. Local distributors reported good business during the present month. Quotations remain as previously reported, the following being those in force on the local market:

METAL LATH—	per sq. yd.
Painted—	
26 gauge	23c.
24 gauge	28c.
32 gauge	32c.
Galvanized, 10c. per sq. yd. extra.	

CLOSET GOODS STILL BEHIND IN TRADING ACTIVITY

Montreal.

Prices on closet goods remain unchanged during the past week with business progressing somewhat, though still behind the mark of other years. Quotations on the local market are as follows:

CLOSET COMBINATIONS—

Low Down Outfits,	each
Closet, standard outfit, oak.....	24 00
Do., post hinge seat	25 00
Do., oak vitro or Pussyfoot.....	24 50

Vitreous china tank with fittings, flush elbow and supply	16 00
Enamelled iron with fittings, flush elbow and supply	16 00

NO FURTHER PRICE CHANGES IN BAR PRODUCTS MARKET

Montreal.

No changes have been noted in the bar products market during the past two weeks, the recent advances seeming to

have come to an end, for the time being, at least. Single reeled machinery steel was the last of these to be noted. Quotations now in force locally are as follows:

IRON AND STEEL—

Common bar iron. 100 lbs.....	3 95
Refined iron	5 45
Irish finish machinery steel.....	4 00
Mild steel	3 95
Single reeled machinery steel.....	5 50
Band steel	3 95
Sleighshoe steel	3 95
Spring steel	5 00
Tire steel	4 15
Harrow tooth steel	3 80
Toe caulk steel	4 85
Mining tool steel, per lb.	0 19
Black Diamond tool and cast steel, per lb.	0 19

NOTE.—Refined iron is approximately \$1.50 per cwt. over base, but fluctuates owing to unsettled market.

Band steel in scroll bundles, 50c per 100 lbs. extra.

Iron and steel 3-16 in. and thinner, 50c per 100 lbs. extra.

SOIL PIPE MARKET EVINCES STRONG TENDENCIES

Montreal.

Soil pipe and fittings continue in a firm market locally. Trading is good and prices continue without change, the levels established in March still ruling. Quotations are as follows:

SOIL PIPE—

2 and 3 inch	33 1-3%
4 inch	33 1-3%
5 and 6 inch	33 1-3%
8 inch	net

FITTINGS—

2 to 6 inch	45%
8 inch	net

CEMENT TRADING IS IMPROVING STEADILY

Montreal.

The cement market is without change locally so far as price is concerned. Trading continues to improve steadily, according to reports from distributors throughout the district. Local quotations are as follows:

CEMENT—

Car load lots, per bag, F.o.b. steam cars	0 86
Per Bag, delivered	0 94
Less car lots, per bag, F.o.b. yard.....	0 94
Per bag, delivered	1 04
Rebate of 20 cents for empty bags.	

ACTIVITY IN RADIATION GOODS NOT OVERLY STRONG

Montreal.

There has been little change in the situation so far as radiation goods are concerned. The market is still more or less quiet though with a slight tendency towards improvement. Prices remain unchanged at the following levels:

RADIATORS AND BOILERS—

Radiator list prices are for 1, 2, 3, 4 and 5 column radiators, per sq. ft.

45 in. to 38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60. Discount 44 per cent for hot water, and 45 per cent. for steam.	
--	--

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05; Discount 41 per cent.

Boilers—Round . t water boilers, sizes from 0 to 10, 52 per cent. off list. Square or sectional hot water or steam boilers, 15 in., 3 per cent. with Ontario Government trimmings, list. Square or sectional water boilers, 19 in. to 36 in., 8 per cent. Square or sectional steam boilers, 9 in. to 26 in., 5 per cent. Ontario Government trimmings, list plus 7 per cent. Square or sectional water or steam boilers, 48 in., list plus 10 per cent. With Ontario Government trimmings, list plus 18 per cent.

Round steam boilers, standard trimmings, 16 per cent. Ontario Government trimmings, 13 per cent.

F.o.b. Montreal, Toronto, Guelph.

EARLY CHANGES NOT LIKELY IN COMPRESSION GOODS

Montreal.

Compression goods remain without feature this week, the steady trading previously reported continuing at levels established some weeks ago. The opinion of local distributors is that these prices will remain in force for some little time to come unless some unforeseen circumstances make other moves necessary. Quotations on the local market to-day are as follows:

VALVES AND BIBBS—

Compression work, standard	45%
Fuller work, standard	30%
Quick opening, compression bibbs.....	43%
Bath cocks, quick opening	38%
Bath cocks, compression	40%
Basin cocks, quick opening	46%
Flatway stop and waste cocks, standard	54%

Jenkins iron body, globe and angle.....	plus 10%
Jenkins iron body, gate.....	12%
N. P. "O" and "S" traps.....	34%

DISCOUNTS ON PIPE FITTINGS HAVE BEEN REDUCED

Montreal.

Pipe fittings have undergone a revision of discounts of late, the discounts being reduced in a number of instances. Plugs, cast iron fittings and flanged unions were altered from 15 per cent. to 10 per cent., bushings from 17½ per cent. to 15 per cent., unions from 33 1-3 per cent to 30 per cent and malleable fittings from 65 per cent to 63 per cent. The discounts now in force are as follows:

PIPE FITTINGS—

Cast iron fittings	10%
Plugs, cast iron	10%
Do., solid	10%
Do., countersunk	10+
Bushings, cast	15%
Do., malleable	15+
Unions	30%

Do., long	45%
Couplings, 4" and under	25%
Do., 4½" and larger	5%

Malleable Fittings—

Piece list effective June 1st. 1922. Discount 63 per cent.

INGOT METAL MARKET STILL IS SOMEWHAT UNSETTLED

Montreal.

The ingot metal market still remains unsettled though there is some slight evidence of a firmer tone this week. The European situation is still a drawback to conditions improving in England and at the moment the outlook is somewhat uncertain. There has been, however, a substantial reaction from the high prices reached a month or two ago and the general level of prices is now more reasonable.

TIN.—This metal continues to fluctuate within narrow limits but there is no sign yet of any particular interest on the part of American buyers. This is

the key to the situation and until they come in to the market again it is not likely that there will be much advance. The local market is slightly lower at 51 cents per lb.

COPPER.—The New York market is easier in sympathy with London where the most is being made of any bearish factors. Copper has now declined 1½ cents per lb. from the top price and 16 cents is not an unreasonable figure. American mills must soon come into the market again which should have a steadying effect upon prices. The local market is quiet at 20½ cents for casting.

LEAD.—East St. Louis continues to decline and evidently the possibility of foreign lead being imported into the U. S. A. has its effect upon prices. Stocks are still low in the U. S. A. and were if not for the foreign situation the market would, no doubt, have rallied before this. London is slightly lower, chiefly

owing to more plentiful offerings. The local market is easier at 8 cents.

SPELTER.—After going as low as 6.75 last week East St. Louis advanced sharply to 7.15 but it is again easier owing to the decline in London. There is evidently considerable buying still to be done for May and June and as stocks are somewhat light a further advance would not be surprising. American spelter has temporarily ceased to be a factor in London where the market is rather easy. The local market is easier at 9¼ cents per lb.

ANTIMONY.—The New York market is slightly easier but locally the situation remains firm owing to the scarcity of supplies. There is no change in local quotations of 8 cents for Chinese but the English market is firmer at 9 to 9½ cents per lb.

ALUMINUM.—A quiet tone continues in this market locally with prices remaining at 25 cents per lb.

Toronto Markets

TORONTO, May 30.—The market trend during the past two weeks has seen more price advances than declines. Business is reported to be better and to be getting better steadily in most lines. Local jobbers report that sales in some lines of plumbing and heating have not yet reached the height expected of them at this season of the year.

The tendency in primary markets is downward at the present time. This is especially noticeable in connection with copper, lead and tin ingot metals. Brass and copper scrap are following and show declines. Lead sheet prices also dropped slightly.

Among some of the lines that advanced in price will be found soil pipe, which takes a new discount of 20 per cent. except on 4 in. size, which takes 25 per cent. off list. The old discount on this commodity was 33 1-3 per cent. on all sizes. Cast and malleable pipe fittings advanced approximately 3 per cent., as did Gurney stoves and ranges. Some varieties of iron and steel bars felt a slight advance in price. There is a shortage noted on some of the latter, part shipments only being received by local jobbers.

Gas and electric ranges are not plentiful; shipments are not being made promptly to jobbing houses.

Collections are not noticeably improved.

LEAD AND ZINC GOODS CHANGE SLIGHTLY

Toronto.

See following list of prices. Cut sheet extras have been added to the lead list:

LEAD AND ZINC GOODS—

Lead pipe, per 100 lbs., up to 2".....	14 50

ANOTHER DECLINE IN INGOT METALS

Toronto.

This week has seen another decline on ingot metals, Copper, tin and lead again featuring. At the end of last year these lines had steadily climbed up in price but of late the price tendency seems to be falling away. Shipments from U. S. A. are slow yet, but

in a short period it is expected that there will be a big improvement in this respect.

Copper \$18.00; Tin \$46.00 to \$48.00; Lead \$8.00 to \$8.25; Spelter \$10.00 to \$10.25; Antimony, \$8.25 to \$8.75; Aluminum, \$23.00 to \$25.00.

IRON AND STEEL BAR PRICES ADVANCE SLIGHTLY

Toronto.

The market for iron and steel bars has been steady and well up to the average; no higher prices are expected for a short period at least. Commercial steel bars are very scarce, part shipments of orders only are being received by local jobbers.

IRON AND STEEL—

Mild steel bars and small shapes.....	4 00

ADVANCE REGISTERED IN SOIL PIPE AND FITTINGS

Toronto.

There has been an advance in the price of soil pipe and soil pipe fittings. This took effect during the past week. The demand in this line is very strong at present and there is no indicating that prices will go any higher for some time. See following list of discounts:

SOIL PIPE AND FITTINGS—

2 inch.....	Less 20%
3 inch.....	Less 20%
4 inch.....	Less 25%
5 and 6 inch.....	Less 20%
8 inch.....	net

Malleable fittings, sold from price list, less 63%	

GURNEY STOVES AND RANGES FIGURE IN SLIGHT ADVANCE

Toronto.

The advance on Gurney stoves and ranges, which occurred this week, amounts to about 5 per cent. on all lines. This change in prices was caused by revision of costs. Material and labor costs have advanced slightly since last stove prices were given out.

SCRAP BRASS AND COPPER FEEL DECLINE

Toronto.

The market prices for scrap materials declined materially on copper both light and heavy, also on red brass turnings. Current prices given below:

SCRAP MATERIALS—		f.o.b. Toronto	
Scrap Iron			
Heavy melting steel	16 00	—	17 00
Scrap pipe	9 00	—	10 00
Steel turnings	12 50	—	13 50
Malleable scrap	14 50	—	15 00
Rails, scrap	13 50	—	14 50
Net tons—			
No. 1 cast	19 00	—	20 00

SHORTAGE STILL NOTICEABLE IN GAS RANGES

Toronto.

The shortage which dates back to the beginning of the year, on gas stoves and ranges is still holding up shipments. This is partly caused by changes in the designs of a large portion of the line.

RADIATORS AND BOILERS RETAIN PRICES OF LAST ISSUE

Toronto.

The demand for radiators and boilers is at present good, and the prices remain unchanged.

RADIATORS AND BOILERS—

Revised radiator list prices are for 1, 2, 3, 4 and 5-column radiators per square foot.

38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60.

Discount on 2, 3, 4 and 5 column standard sizes, 44 per cent. for water and 45 per cent. for steam.

Discount on 1-column standard size, and 2, 3, and 4-column hospital sizes 36 per cent. for water and 37 per cent. for steam.

Discounts on 1 column hospital size water 22 per cent. Steam 23 per cent.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05. Discount 41 per cent.

BOILERS—

Water:

Round 52 per cent. off list. Square 8 per cent. off list.

Steam:

Round, 13 per cent. off list; Square, list plus 7 per cent.

SHEET METAL PRICES ARE NOT CHANGED

Toronto.

The extra of 40c per 100 lbs. for Keystone and Premier brands of galvanized sheets has been cut down to 20c. Other prices remain the same as published in our last issue two weeks ago.

GALVANIZED SHEETS—

		Premier and Apollo	
10 $\frac{3}{4}$ oz.	6 90	7 40	—
U. S. 28 base	6 50	6 90	—
U. S. 23 base	6 30	6 60	—
22 and 24	6 05	6 45	—
18 and 20	6 05	6 30	—
16	5 90	6 15	—
12 and 14	5 75	6 00	—
Queen's Head			
28 gauge, base	7 50	8 00	—
26	7 35	7 60	—
24	7 05	7 30	—
22	6 90	7 15	—
Fleur de Lis			
28 gauge base	7 25	7 50	—
26	6 85	7 10	—
24	6 55	6 80	—
22	6 40	6 65	—

An extra 20c. per 100 lbs. is charged for Keystone and Premier brands copper-bearing sheets. An extra is now charged on galvanized sheets, 10 $\frac{3}{4}$ oz. and 28 ga., when shipped out in sheets 3 feet wide. The extra charged over prices shown in 20c. per 100 pounds.

TANK STEEL PLATES—

$\frac{1}{4}$ -in. and heavier, base	3 60
3-16 in.	3 95

BLUE ANNEALED SHEETS—

10 gauge, base	4 50	4 60
12 gauge	4 55	4 65

MUELLER
A-5260 Reducing and
Regulating Valve.

HIGH pressure is necessary in water mains, for fire protection especially. But it is not wanted in the home. In fact, high pressure strains the plumbing fixtures—makes splashy faucets—causes noisy toilets—induces water hammer—is a constant source of annoyance to the householder.

A Mueller Reducing and Regulating Valve as shown, acts as a shock absorber, reducing the high and uneven street pressure to a steady uniform pressure for domestic use. Save your customers needless annoyance—instal this Mueller Valve on every job.

Hot Water from Electricity

Several interesting developments have taken place lately in Great Britain in the electric heating of water on a large scale. The electric locomotives on a section of railway linked up with an ordinary steam railway are fitted with electric boilers to supply steam for heating carriages which run from the steam line over the electrified system. Again, in a London district experiments are being made in the electric heating of water for the public baths, current for this purpose being taken during the night at very low rates.

PIPE FITTINGS

that give Real Service

In connection with your work this year see that these reliable cast iron pipe fittings are used. Made with iron of high tensile strength and correct tapings.

Our malleable fittings are made of Air Furnace Refined Iron, reamed and tapped to gauge, with perfect threads. We can supply both screwed and flanged fittings, either black or galvanized.

We are equipped to make the general run of malleable and grey iron castings for machinery manufacturers, agricultural implements, automobiles and specialties.

English Sheet Mills Have Large Bookings

President of A. C. Leslie & Co., Ltd., on Return From Abroad Tells of Industrial Conditions in Britain and the Continent

“ONE of the things which most impressed me on my first visit to the different works in England, especially in the sheet steel and tinplate trades,” said W. S. Leslie, president of A. C. Leslie and Co., Limited, Montreal, who has just returned from a three months’ trip to the British Isles, “was to find how busy they were. For instance, the black sheet works of John Lysaght, Ltd., at Newport—probably the largest unit of that kind in the world—were not only working at full capacity but were booked for some months ahead and in many cases were refusing orders. They seemed equally busy on ordinary qualities and on the higher grades such as motor-body, enamelling and polished sheets.

“I found the same condition to apply to practically all the sheets works in the United Kingdom, being due partly to increased demand, but largely to increased export orders, Japan being an especially heavy buyer. The fact that American mills were busily employed for home consumption and not catering so actively for export trade has doubtless helped the British makers.

Similar in Tinplate

“The position in the tinplate trade was very similar, mills generally being very fully sold up and working to the limit of their present capacity, but not operating all of their mills on account of the scarcity of skilled labor and to some extent, of fuel.

“The French occupation of the Ruhr has caused a heavy demand on British coal, this demand coming both from Germany and from other lands commonly relying on German coal. Naturally, this has caused a great increase in the price of coal and still more so of coke and while the producers continued to supply the home trade at much less than the prices obtained for export, they would not supply the full quantity required.

“This, of course, has limited the output of the mills, especially of pig iron which I found in a very firm market. The British makers generally regretted this position—even those who profited by it—as they realized that it could be only temporary and that the rapid advances in price would inevitably curtail buying by the home trade. The effect was being felt before I left for home and prices were accordingly easing off somewhat but no great reduction can be expected until the Ruhr district is again free to manufacture and ship without restriction.

“As it is, the works there are operating to perhaps fifty per cent. of their capacity and as they are shipping very little they are piling up large stocks of

steel, some of which is due to customers on contract, but a great part of it will be thrown on the market sooner or later.

“Before that district was occupied, trade generally had been steadily improving and industrial leaders in Bri-

tain looked forward to a gradual revival from natural causes. As it is, even while the position will require adjustment before long, business and financial conditions generally are much improved and the Mother Country is again showing her wonderful recuperative power.

“I was pleased to find a keen interest in Canada on the part of all British producers and a greater desire than has usually been shown in the past to cultivate this market when conditions are favorable.”

Winnipeg Markets

WINNIPEG, May 31.—The feature of the plumbing and steam-fitting market has been the advance on all lines of tinnerns’ tools and machines. An advance has also been reflected on refrigerator pans and some lines of sanitary closets. Range boilers, soil pipe and eavestrough and conductor pipe are ruling steady. Dealers report that business is showing a slight improvement, and as the season progresses business should improve.

TINNERS’ TOOLS AND MACHINES AT ADVANCED PRICES

WINNIPEG.—Following the strong tone of the tin markets higher quotations are in effect on all lines of tinnerns’ tools and machines. Latest quotations are as listed below:

HIGHER PRICES ON SANITARY CLOSETS

WINNIPEG.—Galvanized heavy gauge iron sanitary closets with seat and cover of walnut finish and outer tanks of brown Japanned with nickel plated steel hinges are quoted at \$5.11.

REFRIGERATOR PANS SHOW AN ADVANCE

WINNIPEG.—A slight advance has been recorded in refrigerator pans. Number twelve is quoted at \$5.11 per dozen, number one hundred and twenty square galvanized with embossed feet is quoted at \$10.54 per dozen.

RANGE BOILERS CONTINUE FIRM

WINNIPEG.—There is no change in the price of galvanized range boilers on the local market. A firm tone prevails and prices are fully maintained.

NO CHANGE IN SOIL PIPE FITTINGS

WINNIPEG.—There has been no change in prices on soil pipe and a good reasonable demand is now in evidence; prospects are reported bright for future business.

EAVESTROUGH AND CONDUCTOR PIPE ARE RULING STEADY

WINNIPEG.—With the approach of warmer weather building activity is improving and eavestrough and conductor pipes are ruling firm at unchanged quotations.

PRODUCTS

Does The Furnace Heat The House?

The function of a furnace is to heat. All talk of design or special features is just so much extra annoyance to the householder whose rooms are chilly.

Gurney Furnaces Heat—Because—

The first section over the fire is double the thickness or depth of other sections, has bell-mouthed smoke flues through it, giving a large, inclined extra surface directly over the fire. In-sloped walls of firepot, push-nipple connections and the "Economizer" feature combine to make a furnace that in low fuel consumption, ease of operation and all round heating efficiency can not be excelled.

If you are not already handling Gurney Boilers write to-day for full information.

A New Sales Plan

We Let You Spend Our Money

Here is your opportunity to test without one penny of expense whether the sale of "DAYTON" Water Supply Systems will be profitable to you.

This, briefly, is how it is done—You send us the names and addresses of twenty-five or thirty people who could use a good Water Supply System to advantage. We immediately begin mailing a series of attractive advertisements—five in all—to these prospective buyers. In each mailing piece is a return card ADDRESSED TO YOU; our name does not appear.

These five advertisements are the finest product of the printer's art and have a cumulative sales appeal that is just about irresistible. Do not confuse the "DAYTON" plan with the ordinary "filled in" form letter campaign.

You get all the enquiries, you close all the sales, you get all the benefits, and without the expenditure of one cent of your money.

We can't tell you the whole story in one advertisement—send the coupon to show you are interested and we will send full particulars by return mail.

It isn't a "DAYTON" without this trademark.

Seven Points of "REX" Union Superiority

- 1 "Rex" Unions are tested and guaranteed to stand 250 lbs. working pressure.
- 2 The counterbored ends prevent the first thread becoming battered and permits an easy entrance of the pipe.
- 3 They will not corrode and will withstand vibration, expansion, contraction, fluctuating pressures and other severe conditions.
- 4 The bronze to iron seat, as used in "Rex" Unions, is recognized as the best known combination of metals to be used for permanent joints and where frequent disconnecting is necessary.
- 5 The octagonal shape of the three parts permits of connections being made with an ordinary monkey wrench.
- 6 The uniform diameter of the waterway insures an unobstructed flow and thorough drainage.
- 7 "Rex" Unions can be supplied threaded to either Briggs or Whitworth Standard and can therefore be used for your export trade.

A Proof of "REX" Union Superiority

Canadian Car & Foundry Company, Limited

Montreal, Que.

FITTINGS, LIMITED, Oshawa, Ont.

Dear Sirs:—Confirming our conversation with regard to Rex Unions; as you are aware, we have recently purchased from your Company a large quantity of Rex Unions, and have found them satisfactory in every respect. They appear to have more metal in them than other Unions, and we also find them interchangeable; in fact we are very well pleased with them and intend specifying your Unions on our orders where we can consistently do so.

Yours very truly,

The Marvel

Gas Water Heater and Tank Combined

simple, compact, low priced, efficient, the Marvel heater is, beyond dispute, in a class by itself as a hand operated heater.

Except for the lack of the automatic feature it is like its big brother the "Royal" in every respect.

Its elimination of the side-arm heater saves pipes, fittings, labor, space, gas and heat. It is readily sold, easily installed, pays a handsome profit and will not require repairs nor adjustments.

Sold only by or through plumbers.

Write for full particulars.

The DUNHAM HEATING SERVICE

(MADE IN CANADA)

Reducing Pressure Valves

The expanded outlet type shown installed permits quick expansion and facilitates reduction from high initial pressure to as low as atmospheric pressure. Also made in straight outlet type and high pressure cylinder type. Details on request.

Accurate Pressure Control for Steam, Air, Water or Oil

Dunham Reducing Pressure Valves automatically reduce varying high pressures to whatever constant low pressure is desired. They do this in one step without the slightest bit of hammering or chattering.

Heating contractors and steamfitters will find these Dunham Valves applicable to a wide range of pressure service. An interchangeability of diaphragms takes care of almost any pressure requirement.

When ordering state maximum and minimum pressure and kind of service. If character of service is not stated valves will be supplied for steam usage.

Installed at the Fine New School, Timmins, Ont.

The Griffith, All Metal Septic Tank is daily making new friends among sanitary engineers—and no wonder.

The sanitary engineer can instal this tank in a fraction of the time required for a brick or concrete tank; he is not dependent on masons or bricklayers; he and a helper can complete the job in one trip.

Besides the school installation at TIMMINS another installation of general interest is one just made for the new Lawn Tennis Club at Rockcliffe (Ottawa).

Our service department is ready at any time to advise you on installation problems. Make use of its valuable information.

Burnham Boilers

Let The Lie Lie

This square shouldered, broad chested Twin is about 71 inches wide and but slightly over 80 inches high.

If a thing isn't so, and you find it out, and go right on letting folks believe it's so, is that a lie? If it is, then we are letting the lie lie, by not changing the ratings on the Burnham Twin Sectional Boiler. The ratings are now altogether too low, according to the work the boiler did over and over again during last winter's severest of tests. But we are not going to jack up the ratings. We prefer to have it do more than we claim it will do.

"Made in Canada"

A Suggestion

"Medium Weight soil pipe has a round bead pattern at the hub to distinguish it readily from the Extra Heavy weight pipe which has a flat bead pattern.

This is only a matter of design, one being as strong as the other.

We respectfully suggest the advisability of continuing the excellent practice of invariably specifying medium weight pipe in the round bead pattern."

TORONTO HARDWARE MFG.,
CO., LIMITED

Sanitary Engineer

Dominates in Its Field

Because—

SANITARY ENGINEER is the only plumbing and heating paper in Canada giving an up-to-date market service in each issue, from Montreal, Toronto and Winnipeg.

SANITARY ENGINEER has exclusive rights for publishing in the plumbing and heating field the splendid articles by Frank Stockdale, America's outstanding merchandising expert.

SANITARY ENGINEER uses more illustrations in the editorial section than any other Canadian paper in its field.

SANITARY ENGINEER is running the most complete and practical series on sewage disposal of any publication in Canada.

SANITARY ENGINEER is the only paper running in each issue a full page illustrated article on sheet metal work.

SANITARY ENGINEER is the only paper running a classified Buyers' Guide in each issue.

SANITARY ENGINEER runs the most up-to-date news service from coast to coast, outnumbering other publications in its field by more than five to one in the number of news items carried.

SANITARY ENGINEER'S editorial policies are conducted along sane, practical lines, based upon the experience of the very best authorities in their respective lines in Canada.

SANITARY ENGINEER is printed on better paper stock than any other paper in its field, thus showing up illustrations to better advantage.

SANITARY ENGINEER is uniform as to make-up, both in its editorial and advertising pages, thus making it convenient for readers.

SANITARY ENGINEER'S news of the trade, convention notes, convention reports, articles on legislation, are the brightest, breeziest, best-written and most complete reports issued to the Canadian plumbing and heating trades by any publication either in Canada or the United States.

SANITARY ENGINEER takes the lead in providing the trade with new, practical ideas, dealer helps, and proving through the printed word that certain plans are being carried out successfully by leaders in the industry.

SANITARY ENGINEER reaches the leading members of the plumbing and heating trade by paid invitation. Copies are not sent out indiscriminately. The paper is of real practical value to its subscribers, and they willingly pay a fair subscription price for it. This ensures reader interest and attention.

SANITARY ENGINEER carries in each issue a large volume of high-class advertising, and most of the representative manufacturers and supply houses use its pages regularly to carry their messages to the Plumbers and Sanitary and Heating Engineers of Canada.

SANITARY ENGINEER maintains, in addition to regular editorial and advertising staffs, correspondents located in the most important parts of Canada, and in this way provides readers with the splendid news service which is not duplicated by any other publication.

The Difference in Advertising Is the Difference in Men

Of itself, advertising is little. And the differences in it are the differences which exist in men.

Just as some men are strong and virile and interesting, so is some advertising. And just as some men are ineffectual and weak and boring, so is some other advertising.

"Does it pay to advertise?" It pays those men who are keen enough students of the public to make it pay them. It pays those men who are truthful, sincere, interesting and believable.

It pays the men whose product deserves the payment, whose brains are keen enough to organize for success and judge enough of the human mind to know how to tell their story with sincerity and interest.

So when you judge advertising, judge it by how it is used and by whom—not of itself and of itself alone.

Remember, an ugly man looks just as ugly in a mirror.

Dart Union Pipe Couplings are **Bronze to Bronze** *(Both Face and Seat)*

The Pittsburg Line Is Complete

THERE are eighteen different sizes and types of Pittsburg Heaters—one designed for every water heating purpose—to fill the hot water requirements perfectly, to give a twenty-four-hours-in-the-day service and to *heat the water at the cheapest possible rate per gallon.*

Because the line is complete—because you can fill the bill exactly for every customer—because there are a large number of definite points of superiority that you can point out—Pittsburg Water Heaters sell readily.

And we are making sales easier. Write for information on our "Selling the Consumer" campaign—a campaign that is at the disposal of Pittsburg dealers everywhere and that has proven a great success in a score of different localities.

Pittsburg Water Heaters are made and guaranteed by the largest and the oldest manufacturer of copper coil heaters in the world, with a reputation extending over a quarter of a century. Each one is backed by the Guarantee of the Pittsburg Water Heater Company.

Pittsburg
AUTOMATIC GAS
WATER HEATERS

"If it's done with heat, you can do it BETTER with gas"

One Mechanical Unit

The primary business of a closet tank is to control water; to measure it and to shut off tight against it.

To ensure its proper functioning, therefore, the New Design Vitro is always sold complete with fittings. These fittings—Vitro fittings all of them—are installed by us and sternly tested at the factory before being put on the market.

The New Design Vitro has other virtues too. It has beauty of line and sheer white gleaming beauty of finish that will not crack nor discolor. But the great virtue, the primary one, it has in the highest degree. It measures water properly.

—And as usual is leading in sales every other tank on the market.

Going after it and Keeping after it

THE ANTHES SYPHON

The heart of the disposal system

Rural plumbing is coy and not to be easily won. Little progress can be made at the first or second effort. It is necessary not only that you should go after this business but that you keep after it.

Your task is being made easier by reason of the propaganda we continue to circulate; publicity that stimulates public interest in sanitation; publicity that means more plumbing for you to sell and instal.

By capitalizing this propaganda you can add largely to present earnings.

Go after the rural trade and *keep* after it.

Sell "Dayton" Pumps

Under the New

"Dayton" Plan

We have been preparing this plan for months. It is different. It works simply, too—like this:

You send us a list of twenty-five or thirty people who can profitably use a "DAYTON" Water Supply System. We then mail a series of five handsome advertisements to these prospects—advertisements that will interest, convince and sell. Each mailing piece carries YOUR name and address on a return post card. Our name is not shown.

We pay postage and all mailing expenses.
You get all the enquiries.
You close all the sales.
You don't risk a cent.
You are bound to profit.

Send in a list of prospects today, or if you wish to know more about this plan, just send the coupon and say you are interested. We will send full particulars by return mail.

No. 307-X "Premier"

No. 127-X "Trenton"

We Make Extended Lip Closets In all 3 Types

Modern sanitary requirements call for the installation of the Extended Lip closer in all public buildings, and many now appreciate as well the advantage of this type of fixture for the private toilet-room.

Our "Lakeside" Syphon Jet is unquestionably the best closet of its kind procurable. If however a less expensive installation is being catered to, the "Premier" Reverse Trap Washdown, or even the "Trenton" ordinary syphon action washdown will give excellent satisfaction.

All of these closets are of course made of Canadian Solid Vitreous ware, and therefore their installation ensures a lifetime of unchanging service.

Dayton Unisystem

Dayton systems can be had in capacities of 100, 160, 240, 350, 720 and 900 gallons per hour. Tanks any size.

The Griffith All Metal Septic Tank. No cement, no bricks, no delays. The plumber installs it and makes connections in one visit. A money maker.

The Waterbury

The last word in Chemical Systems. Guaranteed Absolutely Odorless. Packed complete with all fittings. Write for prices.

Make Summer Time Sales of Griffith's Sanitary Systems

Summer Cottages, Summer Hotels, Country Camps—anywhere and everywhere that people congregate for summer time outings there is a market for some one or other of Griffith's Sanitary Systems.

This business is available to the plumber who **goes after it**. It supplements the regular business of installing sanitary systems and Dayton Water Systems in rural and suburban homes.

We recommend, always, the installation of a Griffith All Metal Septic Tank as the ideal sanitary disposal system; but where the expense of a tank installation is a deterrent, our chemical systems provide adequate service. All Griffith Products are fully approved by Provincial and Municipal Boards of Health.

Our service department will gladly furnish you advice on any sewage disposal problems. We do all the worrying, all the planning. You have only to sell the goods.

Write today for full particulars

The Junior

A smaller system than the Waterbury; suitable for installation in an outhouse or lean-to. Odorless, sanitary, convenient.

A Hand the Plumbers Should Play

Canadian men and women are rapidly being educated to the modern ideas of comfort and better living, with better plumbing fixtures in bathrooms and kitchen as the foundation. The plumbers of Canada should play a strong hand in this educational effort if the Canadian public, as well as the plumbing industry are to reap full benefit. Preach the idea of more bathrooms and better kitchens.

Our advertising is helping you

We are back of this splendid "educational" scheme with a strong campaign of advertising which appears regularly in Canada's finest publications. Hook up with this effort of ours. It certainly pays.

Govt. Demonstration Truck Doing Good Work in Ontario Counties

Thirty Towns and Villages Already Visited in Seven Counties—
People Drive Many Miles to Hear Lectures, Procure Information
and See Practical Demonstrations—Questions Answered, and
Prices Quoted for Complete Outfits

Written specially for Sanitary Engineer by EDWIN NEWSOME, Consulting Sanitary
and Heating Engineer and Lecturer in Attendance at the Truck

THERE never was such a valuable work carried on before in the interest of sanitation in rural homes and farms as is now being done by the Department of Agriculture of Ontario. This statement coming from the writer may look like patting one's self and his employers on the back, but as both are servants of the people, and both have the health and welfare of the people at heart, such a statement must not be so taken, but rather taken in the sense that it is made as a result of the interest shown by those who attend the lectures and take in the demonstrations. Up to the time of writing, over thirty towns and villages have been visited, and as high as 200 people at a place have called and spent sometimes several hours at the truck. In Hamilton the truck was located on the market and big crowds visited it—far more than the above named figure.

Special Lecture to Students

In the town of Selkirk, the truck was visited by over 100 persons, and the principal of the High and Public school called on the writer and asked if a special 30 minute lecture could be given to the scholars. This was willingly granted, and the scholars all walked down from the school to the demonstration truck in file formation in charge of the principal and his staff. The scholars numbered 120 and after the lecture, those who wished to ask questions were called upon to do so. The time taken up, every minute of which was made good use of, was about one hour, and the principal and staff stated that everyone in attendance received much valuable information.

Owing to the distance the truck had to travel, it was late in reaching the towns on time at which demonstrations had to be given. To find that many people had driven miles to see the demonstration truck and receive information, proved without doubt that the work being carried on is being appreciated. At the little village of Tyrrell over 50 people, men and women, attended; some had driven miles, and the teacher at the school gave the children 30 minutes time to receive a lecture on the subject of sanitation, water supply, etc., for the farm homes. Many of the children in Tyrrell and Selkirk had never seen a real shower fixture or even a cast iron enamelled plumbing fixture, and to note the interest taken by these little Canadians was an inspiration in itself. One little tot asked the teacher, "Say, please mister, how do you make that thing rain in one place," referring of course,

to the shower in operation. The little folk were simply filled with wonderment.

How the Work is Carried On

To give the readers an idea as to how the work is being carried on should be of value to them.

In the first place a list of places are chosen, that can be called at where such equipment is most needed and where the Women's Institute have in many cases asked that the truck be sent. The local papers carry a fair sized advertisement, announcing that on such and such a day the demonstration truck will be on view with two men in attendance. The same papers very often contain a reading notice as well in the editorial columns, and after the truck has been there still further comments are made.

The agricultural department also send out posters and billheads to the officers and members of the Women's Institute and give instructions that posters are to be distributed to stores and offices, etc., so as to be easily seen by the people of the various towns. Thus the interest is aroused in advance of the truck arriving.

When the demonstration truck reaches a town or village, it is placed on as public a site as possible, very often right on the street, but always where there is a good supply of water available, either a well or a good cistern.

If there is electric current available, the pneumatic water system is put in operation and is kept working until it stops automatically. If there is no electric current, a hand system is used, and all the plumbing fixtures are placed under pressure. This of course soon draws a big crowd and questions pour in thick and fast.

Explain the System

As soon as a suitably large audience is on the ground, the writer begins and gives an address, after which he and his attendant, who is a graduate of the Ontario Agricultural College, gets in among the crowd and explains many points in connection with the whole demonstration.

The construction of valves, bibbs, frost cocks, etc., is explained; how and why pumps are made the way they are; conditions where it is advisable to use and where not to use a shallow well pump; where large tanks for water supply systems are advisable and where smaller sized tanks can be used to advantage; the trade names of goods, for example the value; the cleanliness, say, of post-hinge closet seat is

shown; how a system is used, installed and put into operation; why it is advisable under all conditions to dispose of sewage by using a septic tank instead of a cesspool, and how a system operates, showing conclusively that it is preferable to any other type of flushing device in a septic tank.

Specific Advice

The writer is often asked to call at places where specific advice is needed and many times such a request has been granted. Three cases in particular will here be given:

At one farm a house has been fitted up with a complete bathroom outfit; the pump is one that could be operated by hand or power. Owing to bad crops, illness in the family, and the fact that the pump is altogether too hard to operate by hand, because it is too big, the whole plumbing outfit has never been used.

The farmer feels that he was given somewhat of a raw deal, and he was to a certain extent. But after a little explanation a smaller hand pump is shown to be needed for the present and by now the system is very likely in use.

Another instance was where the lady of the house saw the truck and the outfit, but wanted to know how and where such a complete equipment could be placed in her home. The whole thing was laid out and prices are being called for now. Still another case. One plumber several years ago had declared that a deep well pumping system would be absolutely necessary. Such, the writer found is not the case, and while this same man also said that it would require at least a two horse power gasoline engine and pump to furnish water, it was found that a one-half horse power plant will do the work, and not even a deep well is necessary.

Calls on Local Plumbers Where Possible

The most important question put to the writer was, "What will all this complete outfit cost installed and ready to turn on the taps? The writer calls where possible and procures a price on the outfit, including septic tank and sewage disposal bed complete and it might well be stated that prices ranging from \$500 to \$650 have been quoted. In several towns the local plumber has been on hand mixing in with the crowd and taking actual orders. But, in many cases, the plumber, sad to say, has kept in the background and when asked why such an indifferent attitude is shown has replied, "I don't have to go after business, if they want me they know where to get me."

As a matter of fact the writer has been told many times that it is a hard job to get a plumber to do a job. This is an awful indictment, but can be proved to be true in some cases, and also goes to show that there is big business to be procured from the farmer and rural resident, particularly in those districts where the government demonstration truck has been.

To the man who is slaving his life away in a city, tendering against low prices, cut price jobs, etc., this plan of education should and would be a boon

if he would move out into the country and work for the people who are willing to pay the price where value can be shown.

Quit Carrying Water

For the purpose of demonstrating practical and economical methods of providing

Running Water and Installing Modern Conveniences for Farm Home

The Provincial Department of Agriculture has fitted up a truck with **Air Pressure Water System, Hot Water Boiler, Sink, Pumps, Bathroom Equipment**

Demonstrations as to the methods of installing water systems under varying conditions and the utilization of running water to the best advantage in the home will be given by a practical plumber who has had a wide experience in connection with this line of work.

Demonstrations will be given in HALDIMAND and NORFOLK as follows:

Canboro	- (Township Hall)	-	June 5	-	10 a.m.—3 p.m.
Cayuga	- (Town Hall)	-	" 5	-	4.30 p.m.—9 p.m.
Selkirk	- (Community Hall)	-	" 6	-	10 a.m.—3 p.m.
Jarvis	- (Arena)	-	" 6	-	4.30 p.m.—9 p.m.
Tyrrell	- (Community Hall)	-	" 7	-	10 a.m.—3 p.m.
Marburg	- (Community Hall)	-	" 7	-	4.30 p.m.—9 p.m.
Delhi	- (Park)	-	" 8	-	10 a.m.—3 p.m.
Courtland	- (Memorial Hall)	-	" 8	-	4.30 p.m.—9 p.m.

The public, both men and women, are invited to visit the truck at their convenience, any time between the hours named.

The Demonstrators will be ready to answer questions regarding any feature of plumbing, installation of pumps, location of tanks, protection of wells, how the farmer can do most of his own plumbing, costs, etc. One of the Demonstrators will be in attendance at the truck continuously between the hours named, ready to demonstrate and answer questions. Where convenient one of the Demonstrators will visit the homes where installation of water system is being considered, for the purpose of giving specific advice.

Invite your friends to come with you and witness the practical demonstration of a water system practical for the rural home.

GEO. A. PUTNAM, Supt. of
Institutes, Toronto.

C. FREY, Agricultural
Representative, Cayuga.

HON. MANNING W. DOHERTY,
Minister of Agriculture,
Toronto.

G. G. BRAMHILL, Agricultural
Representative, Simcoe.

The above bill in large size is used as an advance notice in connection with the lectures of the Ontario Government dealing with rural sanitation. This bill, with names of places changed, is mailed out and posted up in every store in the district where the truck calls.

Started Fourteen Years Ago Plumber Now Does \$100,000 Turnover

Employing Fifteen Journeymen in Rush Seasons, Goodram Bros., Plumbing and Heating Firm of Hamilton, Tell How Business Can be Stimulated in Usual "Off Seasons"—Five Heating Systems Renewed in Short Time—Running a Branch Shop

THE stimulation of business in plumbing, heating and ventilating equipment during the present "off seasons" in the industry, in order to even up the amount of work being done throughout all seasons of the year, is one of the most important considerations facing the industry to-day, according to W. E. Goodram, of Goodram Bros., a thriving plumbing and heating concern of Hamilton, Ont., which has built up a substantial business by the employment of some very valuable and interesting sales and administrative policies. With the general interests of his fellow craftsmen at heart, Mr. Goodram discussed at length with Sanitary Engineer, some of the problems facing the trade and outlined fully the means taken by his firm to overcome them. Some splendid pointers were given which contain some helpful ideas for others in the trade.

Going further into the question of necessity of taking steps to even up business throughout the year, Mr. Goodram pointed out that the public had to pay for the present condition of affairs by which an employing plumber was forced to employ twice as many men at one time of year than another. It was shown that the best class of workmen do not care to work on this basis, and that while only five men might be employed where in rush seasons there were ten employed journeymen, that the stock and equipment for the whole ten had to be carried along as an overhead expense during the whole period by the employer. Furthermore, considerable stock had to be carried over slack seasons with resultant charging of excessive interest charges to overhead expense. Mr. Goodram pointed out that \$1,000 invested in stock which does not move for a year represents \$60 loss in interest to the plumber apart from other charges, and forcing competent journeymen to walk the streets for four or five months in the year. The solution for this difficulty lay, he thought, largely with the men employed in the industry. He thought some concerted action might well be taken by all branches of the industry to overcome this situation, just like the paint people have largely succeeded in taking paint out of the Spring-season class and making it an all year round seller.

Big Turnover

This firm has been in business for fourteen years and now does a turnover

of between \$75,000 and \$100,000, employing fifteen men in busy seasons such as early spring and graduating down to ten as the lowest point, this being during the month of January. Jobbing work alone averages \$500 a month. A showroom, office and workshop are conducted at 248 King St. West, Hamilton, and a branch shop is conducted at Burlington, Ont.

The conduct of a shop at Burlington gives some indication of the wide field covered by this concern. Mr. Goodram pointed out that much profitable business was secured from Hamilton people who build summer homes in the country districts surrounding the city and much of this building is done in Burlington. A number of men work out from this shop throughout the season. Prospects of this kind are being watched for at all times, and the firm's efforts to induce such prospects to instal the most modern sanitary and heating equipment in summer homes has brought good results. In some cases such homes contain the most up to date heating equipment and a num-

ber of bathrooms, in addition to complete laundry and kitchen outfits.

Renovating Work

Another way in which business can be stimulated in off seasons, despite any lack of new construction, is renovation work in existing buildings. Mr. Goodram stated that as result of some special work on various prospects, five warm air furnace installations which were not giving satisfaction due to the construction and size of certain houses were taken out and hot water systems installed within a period of a few weeks. Such business could, he thought, be considerably developed when other work was not offering.

"It is only by the employment of such methods that business enough can be secured to make unnecessary the laying off of 25% of the plumbing and heating journeymen during the months from January to March inclusive," said Mr. Goodram.

Best results along the lines of replacements were said to be made in the cities and larger towns. It has been the experi-

Interior view of workshop of Goodram Bros., Hamilton, Ont., showing pipe cutters and other machinery and the 135 bins which extend down the whole side of the shop with lines in each bin stencilled on the front board.

ence with farmers that if they were figuring on selling their property they would spend money to have it fixed up, but if not it was difficult to get them to move in view of the low prices secured for their crops. While a certain amount of such business could be secured, the expense was so great for thoroughly canvassing them, and results so meagre under present conditions, that little along this line was contemplated.

In concentrating effort on prospects for plumbing and heating equipment, Mr. Goodram points to similar work done in the vicinity. His firm has a number of prominent installations to its credit, both large and small, and it is found very effective to show an illustration of some such installation in the advertisement or other literature as an indication of the work done by the firm. Attention is also drawn to such installations verbally when occasion offers.

Premise report cards were formerly used by this firm to some extent, but it was found that unless the workmen were given commission on the additional work received through this medium, that they were very lax in putting it into effect. Mr. Goodram was of the opinion that much better results can be secured by having this report system carried on by the office help or special salesmen.

This firm use newspaper advertising space to reach the rural trade, and send special literature to prospects in the city, depending upon what work they are prospects for. Such effort is backed up with a showroom, which is not illustrated herewith because of the fact that it is to be altered.

In this showroom, an unique feature which has been found very valuable is to show in connection with each fixture what the cost is. A small holder is affixed to the wall above the wash basin, toilet, etc., and in this holder is a card on which is typewritten the various equipment involved with the price opposite each. A separate entry is made for instance for the sink, faucets, pipe fittings, etc., giving total for the complete job installed. Mr. Goodram pointed out that the underlying idea of this plan was to show customers that there was no secret about prices. It was his opinion that the public know too little about the plumbing industry and that is why they have been somewhat suspicious of it. Placing the "cards on the table" by showing a definite price to all who enter the showroom was one way in which this suspicion could be allayed.

The showroom faces on the front street, the office is in the centre of the building and the workshop is at the rear. As illustrated herewith the workshop is completely fitted to facilitate the location of pipe fittings, etc. Threading, pipe cutting and other machinery is available to assist the various branches of the work. In all there are 135 bins con-

Gentlemen:

As we are closing our fiscal year on the end of ——— and the auditor will have our books to balance at this date, therefore we are trying to facilitate his work by lessening our book assets and liabilities as much as possible.

If it is convenient for you to settle our account before this date we would appreciate same very much. If not, would you kindly sign the enclosed voucher and return to us before ———.

Thanking you for your patronage and past favors and assuring you our efforts will not relax in improving our service for the year 1923.

Yours very truly,

GOODRAM BROS.

Per W. E. Goodram

I hereby acknowledge the correctness of my account with GOODRAM BROS., at ———, 1923.

For

Please sign here

Above are shown the forms used by Goodram Bros. in connection with securing information re delinquent accounts. The top form is a letter sent, enclosed with which is the card bearing the wording shown in the lower form. The use of this plan either brings settlement or a satisfactory statement, in the great majority of cases.

taining elbows, tees, etc., specifications being stencilled under each bin. These fittings are arranged in such order of size that even a new man can readily put his hand on requirements with very little searching.

Mr. Goodram in discussing various business policies pointed to the advisability of getting invoices out quickly after the completion of the job. If a job is done to-day his office sends the bill to-morrow. While the customer is enthusiastic about the work is the time to make him pay, says Mr. Goodram, and he doesn't wait until the novelty dies off and the customer becomes lethargic about paying the bill.

The firm prides itself on the small proportion of accounts classed as bad debts. The largest account ever lost was one for \$51. As stated, an invoice is sent out immediately upon completion of the work. A statement follows at the end of the month. If at the end of the next month payment is not forthcoming a personal call is made by someone in the firm.

In connection with some overdue accounts which had not been paid despite the regular efforts, the firm used a letter to good advantage. This letter and card enclosed are shown elsewhere. This combination brought in considerable

money and where money was not sent a statement was made which gave the firm some idea of what they might expect.

"There would be a big shortage of mechanics in the plumbing and heating industry of this country should a big development come in this business," said Mr. Goodram to Sanitary Engineer in discussing the apprenticeship question. It was stated that the only mechanics now coming to Canada were from the Old Country, and that the supply of these was not sufficient to meet the requirements of a rush season here.

Mr. Goodram is of the opinion that some steps will have to be taken immediately to solve the apprenticeship problem in order to safeguard the future of the industry. As it is, there are so many other better paying positions open to young men, where clean clothes and an attractive appearance can be presented, that an apprenticeship in the plumbing industry is less attractive to the young men than formerly.

"If we paid \$20 a week to young men, such as is being paid in other lines," said Mr. Goodram, "we could not afford to keep him around the shop instructing him in such a way as we could afford to do were we only paying him \$7 a week. He would have to get out and hustle and earn the increased money."

"Showroom More Economical Than Operating Business From Private Premises"

Latter Type of Plumber Escapes Only the Smallest Items of the Overhead Expense and Sacrifices the Advantage of Maintaining Direct Contact With the Public, Says Mr. Goodram

DISCUSSING the question of relative costs of operating a plumbing and heating business from a central showroom and office as compared with operating from a house, Mr. Goodram expressed some interesting views.

It is his opinion that the shop is more economical from several standpoints than is the conduct of business from a house, in addition to which there are the advantages of having a showroom to show various fixtures as they appear installed and to help the plumber conduct business on a merchandising basis. Mr. Goodram expressed the opinion that the plumber does better when he identifies himself as a business man of some standing in the community, anxious to do business on the same basis as other merchants, and that he cannot do so unless he has some central place of business with some distinguishing features such as a showroom.

As a general rule the plumber working from a house carries little or no

stock. It is necessary for him to depend to a much greater extent on the wholesalers' stocks than with the plumber conducting a showroom and shop. Here is a waste of time and additional expense in transporting equipment.

"The man operating from a house may save on such overhead items as 'light, heat, donations, advertising, real estate repairs, rent, etc., but these are among small items in relation to other overhead costs," said Mr. Goodram. "Buying in larger quantities enables the plumber with shop facilities to buy to better advantage, saves time, and there is naturally a limit to what any operator can do when working out from a house. An attractive place of business is needed to influence the public, and while some plumbers do a comparatively big business from houses, I don't think it helps put the industry on the desired plane to conduct business in that manner, and it is just possible that they could do an

even larger business were they to conduct a central showroom and shop.

"There is no argument against the showroom," concluded Mr. Goodram, "but judgment must be used and the expense kept within range of the business done. It doesn't pay to run the overhead expense up too high by the showroom. In our own case our showroom is looked for by the people of the community, it is our outward appearance to the public, always on view, and it retains our connection very definitely. It is our intention shortly to reconstruct our showroom so that it will not take up so much room. We will put in a model bathroom which can readily be changed to a model kitchen or laundry and let that be sufficient in the way of display. We will then extend our office to take care of the bigger business we are working up."

Mr. Goodram is of the opinion that the indenture system is the only plan on which to develop apprentices, pointing out that under the present plan after serving two or three years, an apprentice will go away and become independent of the master plumber who has been teaching him at his own expense. This is obviously unfair to the employing plumber.

Part of the busy staff of fifteen or sixteen journeymen employed by Goodram Bros., Hamilton, Ont., photographed by Sanitary Engineer just outside of the firm's shop. Some of the ways in which the firm, with the help of these men, develop business, are to be found in the articles in this issue.

Divides Overhead Into Productive and Non-Productive Divisions

Anything Not a Direct Charge is Non-Productive,
Says Mr. Goodram, in Describing Unique System
of Accounting

COSTS are a very big item in plumbing and heating business, they are more involved in this than in many businesses and unfortunately there are probably fewer people in this industry who know what costs are than in most other lines," said Mr. W. E. Goodram to Sanitary Engineer. "Much of the cut price competition which has to be faced in this industry comes from operators whose knowledge of costs is so meager that they do not know that they are really doing business at a loss in many cases. In such instances the people for whom work is being done are not paying what they should, work is denied the established operators and being done by those who by the manner of their work alone must of necessity be of the fly-by-night variety, and the whole industry is damaged."

Going into details of the accounting methods employed in his business, Mr. Goodram outlined the items involved in overhead expense figured on the basis of productive or unproductive labor. These items included:—gasoline, motor oils and grease; car repairs; repairs to tools and equipment; light, heat, gas

and fuel; donations to charity; advertising; travelling expenses; postage and telephone; audit and legal; association dues; stationery; real estate and repairs; rent cost; bonuses paid; incidental; wages, (non-productive); depreciation; bad debts; interest; insurance and taxes; workmen's compensation; proprietor's drawing account.

"Anything which is not a direct charge is non-productive," said Mr. Goodram pointing out that a shop man might have certain hours of productive labor and unproductive labor during a day accordingly as it could be charged against some particular job. Time spent in delivering goods to a job is classed, for instance, as non-productive labor.

In connection with office direction, it has been found advisable to close the year at the end of March. This was decided upon because of the fact that there is less left over work and less material scattered around on various jobs at that time than at any other time of year, and as a result the inventory job is minimized and stock-taking can be done much more accurately.

Committee on Plumbers' Brass Goods Makes Interesting Recommendations

Obsolete Types to be Eliminated—All Brass Fixtures Must Withstand Test of 100 lb. Pressure

SOME months ago the National Association of Brass Manufacturers was requested by the United States Government to revise specifications for plumbers' brass goods for the treasury, war and navy departments. Accordingly, the president of the association appointed a committee on traps, drain fixtures, flushing devices, etc.; another on showers, bath and other combination faucets; and a third on single faucets, valves and miscellaneous items. These committees, in collaboration with men from other manufacturing firms not members of the N. A. B. M., have drawn up tentative recommendations.

The fundamental principles of procedure approved by the committee were:

Obsolete types to be eliminated.

Detail measurements to have liberal tolerance.

Manufacturing process not to be specified.

Minimum weights of brass goods to be specified.

As few metal mixtures as possible to be specified.

Brass manufacturers' standards to be accepted as far as possible.

The guiding thought of the committee has been to aid in planning a set of specifications for plumbing the government buildings which will secure brass goods that are serviceable, modern, and regularly produced by reputable manufacturers as stock material.

The manufacturer's mark should be stamped or cast on every fixture, and on every part that is not a complete unit.

All brass fixtures, such as faucets, valves, supply pipes, etc., before offered for sale must withstand a test of not less than 100 lb. of constant water pressure to the square inch; ground cocks to withstand such a test of not less than 200 lb.

No red or white lead or other harmful compounds to be applied to female threads of joints in pipe fittings. This will avoid a large amount of residue lead and other poisonous ingredients which contaminate the water for a period after installation.

The word "compression" in connection with faucets, stops, and the like, covers those types whose stem has a thread of not more than 1/6 inch per revolution. Those travelling more than 1/6 inch per revolution are designated as "quick compression." All Fuller faucets should be eliminated for compression or quick compression faucets. The delivery capacity required of quick compression faucets, stops, etc., and self-closing faucets should be less than the delivery capacity required of compression faucets.

All faucets and stops should be constructed so as to be safe against self-opening at a constant water pressure of not less than 80 lb.

Specifications should permit the entire designations on handles of faucets. That is to say, the words Hot, Cold, Ice Water, should be spelled out instead of the initial letters used, such as H, C, I.

Specifications should not be limited to gate type valves. The type of valve to use depends on the nature of the fixture, pressure, and other factors. In many instances, globe valves, angle valves, or compression stops are better suited to the purpose than gate valves, and less costly.

It should be noted that the term Non-Scalding Regulating Valve is often used loosely in advertising literature. It should be applied only to valves that are thermostatically controlled. If it is desired, we suggest the installation of an automatic temperature control valve near the source of the hot water supply at a point where it is desired to control the temperature of the hot water.

The 3 1/2-inch size of hand spray is considered "special," the 2 1/4-inch is in general use and should be specified.

Faucets for hose connection should not be shown as having a shoulder immediately above the hose thread.

Flushometers have not been standardized, but are mostly patented articles, and each manufacturer has a specific and distinct construction. Under the circumstances the committee is not warranted in making any recommendations.

When lavatory and sink traps are made with two union connections that permit the removal of the return bend in the dip for the purpose of cleansing they shall not be supplied with a trap screw or clean-out plug.

When a return bend is cast integral with the outlet of lavatory and sink traps, they shall be provided with a clean-out screw or plug. Such a screw or plug shall be located not less than 1 1/2 inches below the normal seal surface or else at the house side of the seal.

The free opening for clean-out screw or plug in cast sink and lavatory traps must not be less than 7/8 of an inch in diameter.

Traps must have full and perfect threads not finer than 14 to the inch.

The connected waste and overflow with stopper is the most sanitary installation for baths.

How Extra Business May be Secured

Give Him Fresh, Cool Water

A horse is at his best only when his drinking water is always fresh and cool.

Common sense and human kindness join in urging that kind of water supply for all live stock.

It can't be done with pumps and pails and stagnant troughs—except by extravagant waste of time and effort.

A Farm Water System supplies running water to every trough, every barn, every stall, and the water is cool and clean.

Running water on the farm is too valuable for any farmer to do without.

See a Farm Water System for deep or shallow wells; we'll sell on time-payment basis.

How to Order Advertising Material

Advertisements in each issue will form a complete month to month advertising campaign for your use.

These are only a few of the electros available in this service. Complete catalog of all illustrations available to date will be mailed on request.

The catalog gives serial numbers on each illustration and the price is quoted. Prices range from 30 cents to \$1.00 for electros according to size.

In ordering from catalog write plainly the serial number of the illustration and send remittance to cover the order in order to save cost by avoiding book-keeping expense.

*By Courtesy, National Trade
Extension Bureau*

When the Day is Done

and the family gathers for the evening, it is easily seen whether or not there is running water on the farm.

Where there is no running water, tired lines in the housewife's face and figure tell of exhausting labor, pumping and carrying heavy pails of water—besides the other housework.

The farm housewife is no criminal! Don't make her serve a life sentence at hard labor! A Farm Water System is inexpensive, reliable and a paying investment. Pumps for either deep or shallow wells.

An Extra Bathroom for Large Families

In any dwelling which houses more than four persons, more than one bathroom is needed. Comfort and convenience demand the additional bathing and toilet facilities.

Too many property-owners think that an extra bathroom calls for costly remodeling. Our booklet, "Is Your Home Truly Modern?" will show you the wrongness of that idea. Ask for it to-day.

A large closet, an alcove or any unused space, five feet square, is large enough for a complete, modern bathroom! Particulars on request.

Tinsmithing and Sheet Metal Work

Increasing the Volume and Profit Margin on Various Sheet Metal Work

Outgoing Dollar Based on Average Sheet Metal Job is Made Up of 37 Cents for Merchandise, 32 Cents for Labor and 31 Cents for Overhead—Furnace and Sheet Metal Work About Same—Ventilating and Special Sheet Metal Work Varies Somewhat

(Written by a sheet metal worker)
(Continued from last issue)

IN OUR issue of June 1 a sheet metal contractor explained what the cost of doing a sheet metal business is and the following article is a continuation:

But let's see,—take the six men and four helpers' payroll of \$1,512.00 per month; he would receive, according to the payroll of \$1,512.00 × "Officers' Salary" unit 0.082, equalling \$123.98.

But running a small business of this size, he would be drumming up all the business and is therefore entitled to the unit of "Salaries—Selling" which is 0.0799, on \$120.80.

And inasmuch as his foreman is productive he is also entitled to the indirect labor unit of 0.088 on \$1,322.05.

So we have:

Officers' salary	\$123.98
Salaries—selling	120.80
Indirect labor	132.05

Total\$376.83

The shipping expense will remain which amounts to \$186.12 of which \$70.92 may go to "Lost Time" and \$115.20 for a driver's salary.

Comparing this with the operator's salary of \$328.00 per month, based on a \$5,000 per month payroll, we find that the small operator draws \$52.78 more salary than the larger operator.

And supposing that both operators are getting their work on close competition, or practically without a profit, it is clearly seen that the small shop is the better proposition of the two.

The large operator must increase his salary with profit—but how can that be done when there is no profit to be had?

Now then, as to rents.

An operator with a \$6,000 payroll, according to the rent unit, will be paying \$6,000 × 0.0165, or \$369.00 rent per month.

An operator with only three men and two helpers, a payroll of \$756.00 per month, applying the rent unit, would be paying \$46.49.

It all looks simple, does it not?

And I believe that the figures are not far from being correct.

You can apply these figures in group units or all in one total unit of one dollar to your total expense budget based on your productive labor, to see if you are within keeping of your estimated expense in relation to your volume or running behind, or you can apply them in group units—anyway you see fit so long as you do it.

Big Volume Not Always Desirable

Here is another illustration to prove that volume is not what it is cracked up to be, also to show where volume is needed.

Let's take the one man and one helper payroll, a total of \$291.60 per month.

Applying the expense units, how much salary will the boss have in this case when he does all the selling, superintending and office work?

He does all the work called for under units of	
Officers' salaries	0.082
Office salaries	0.089
Salaries—elling	0.0799
Indirect labor	0.088

Total unit 0.3389

Applying this unit to his expense budget of \$291.60 we have \$105.55.

In most cases his entire time is productive along with his one man and helper, but we will base this example only on one-half of his time as productive, so we have 108 hours at \$1.00, \$108.00. Therefore, his salary per month is \$213.55.

You may say that this man should increase his volume, or better, work for someone else.

But supposing this man gets a profit on his work, say at least 10 per cent. on top of his merchandise, labor and expense, and basing his merchandise on the average at the same amount as his productive labor and taking into consideration that the larger operator is after the volume and in most cases without a profit, we set down this example.

Hired payroll	\$ 291.60
Owners, productive	108.00

Total labor \$ 399.60

Merchandise	399.60
100 per cent. overhead	399.60

Total cost	\$1,198.80
10 per cent. profit	119.88

Monthly sales \$1,318.68

Now to compare his salary with the larger operator's salary of \$328.00 per month, we have:

Administration salary	\$105.55
His productive earnings	108.00
Earned profit	119.88

Total monthly net earnings .. \$333.43

Now, inasmuch as the larger operator is not getting a return on his investment, we can't insist that the small operator should.

They are both getting practically the same salary, the only difference is:

Big Business, Big Worry.

Little Business, Little Worry.

Capital Units Number 1.

	\$1.00

How to Apply the "Capital Units"

That is to determine the amount of business a given amount of capital can handle.

The difference in figures between number 1 and number 2 is the difference in the size of the business and the difference in management.

Some will require a certain amount of capital to conduct the business on a sound basis.

Others conduct their business on their nerve and someone else's money.

To explain the application of these units to a given capital, including borrowed money, we will take the figures as shown in number 2.

And in order to keep within the limit of these figures, you will have to be a good manager, a good buyer and a good collector.

Supposing you were going to start in business with a \$5,000.00 cash cap-

(Continued on page 23)

Patterns for a Conical Scoop

Written for Sanitary Engineer by O. W. Kothe, Principal,
St. Louis Technical Institute

THIS scoop is also more of a problem of value in the cutting of miters on conical figures than for its necessity of making as most of these scoops are factory made. The miter development is interesting as it helps to understand other work and so it is not a waste of time in laying out.

From the elevation we see we have two cones as A-C-B-A and A-B-D-A. The axis line in the length is C-D and the short line A-B. These lines of measurements can be made anything to suit conditions. Then the miter line is traced through at pleasure. This shows that it does not matter in what way or in what position you cut a conical fitting. The treatment would be followed this way, since our cut in this case is irregular. Describe the half section which shows that the shape through A-B is cylindrical. Divide this half section into any number of equal spaces as 1-2-3-4-5, etc., and project lines to the base of cone A-B. From these points radiate lines to the apexes C and D as shown. Now where these radial lines cross the curved

miter line drop lines to the slant line as B-D and D-C.

Observe this places all the fore-shortened radial lines in a true position on a true slant line and enables us to get true lines for the pattern. To set out the pattern for the back part, set dividers to D as center and D-B as radius, strike an arc indefinitely. From the half section pick the girth spaces and set off twice

as many, establishing the points 1-1 as shown. Draw radial lines to D and then from each point in the slant line D-B, sweep arcs into stretchout, thereby cutting radial lines of similar number. Through these new intersections, sketch the curves and you have the pattern for the back part of scoop.

For the fore part of scoop use C as center and C-B as radius, describe an arc indefinitely. Then set off the girth required to make this lip as we see the intersection of this cone merges with the base A-B in point 4 of half section. So we set off twice the spaces from 4 to 9 and 9 to 4. Draw radial lines to C and then from each point in lines C-B sweep arcs into stretchout, thus cutting lines of similar number. Through these new intersections trace a curved line making it uniform so no hills or hollows appear and you have the pattern for the lip of scoop. A small edge must be allowed for seaming and if a wire is to be enclosed along the edge an allowance equal to $2\frac{1}{2}$ times the diameter of the wire must be made for this also.

APPRECIATES "SANITARY ENGINEER."

"We appreciate Sanitary Engineer very much and find it helpful both for current prices and articles on sewage disposal."

"They Think Muney Groze on Berry Bushes and Ther Developin' Into Berry Pickers"

So Jerry Describes the Trouble With the World To-day—Jerry Visits the Ontario Society Convention and Tells of What He Learned in Toronto—"The 'Prentice Question is Sure an Agger-
avatin Won"

Written for Sanitary Engineer by MAJOR L. L. ANTHERS, Managing Director
Anthes Foundry Co., Ltd., Toronto

Dear Friend Al.—

You musta thot I've been hibernitating with the bares etc. oweing my silents for the passed month but weave bean bizzy with a Capitol Bever since the fine wether begin 2 come. But the wether hass-ent bean all fine considering the rain witch has bean a regler caller for the last weak. Bizness got off 2 a good start at last & weer lumpin from daylight saveing 2 dawn.

However I did get a chanct 2 attend the big conventn. at Tronto in May and a good time was had by all. We had a big luncheon at the K. George the 1st day & ended up with a banket at Brig-hams the last day. The pieces de resistance at the banket were severial in number.

George Baker told us all abt. "Wot the 'ell Bill," and George sure can do wot the 'ell. Ide justa soon lissen in on George Baker any day as Harry Larder.

Then Persey Mansale and Garry Franklun did Mr. Galliger & Mr. Sheen & they sure did them Brown. Peeples is in jale fer less. A feller wat has "door-able as the piryimids" fer a mother says the plumber make a mistake wen he misleads the publick to bleeve that a plumbing job shld last a life time. Reny-vation he sez is the life of trade. I guess its time to give the perymids & the spinx a change of hart.

A big feller from Deetroit what runs the stait of Mishigan in plumbing matters give a grand spiel. His name is Kennedy. He hailes from Tronto & sez he lernt his traide with old Kenny Alliston & unernt it with the 2nd jennyration by witch he ment Kenny Jr. But all joakin on the side he ripped things close and handed out a lotta powrful doap. He sez that if a plumber goze arnd. lookin like a bum the genl. publik is likely to mistook him fer a bum. A good plumber he infurred shld. be knowne by his laundry bill. He was a purty smart-lookin cuss hisself & judgin by his success he musta had the rite slant. But bleeve you me Al its hard on yr. neck to rassel with a seller drain with a white stiff stand-up coller on. I bet-

cha if he looked back fur enuff he had a purty dirty neck hisself sometimes. It aint the nature of the plumber to git dirty & all mussed up but it sure is the nature of the bizness. Of coarse if you gotta offis job & aint got nothin to but ride round in a Packer inspectin jobs & given someone ell onct in a wile its all rite & you kin keep yr. coller cleen. But there aint the saim no. of yung men comin inter the bizness nowadays & mennys the time a boss finds hisself short-handed & has to dig in hisself. This prentice questn. sure is a aggeravatin won & keeps the boss guessin wear the traide is goin 2 drift 2.

Wile ime bugs on eddication miself seein as I never had mutch I bleeve in givin a yung feller a chanct but theirs a lotta yung fellers wot is tired of skool by the time theys 12 but the law sez as how they must continyer untill theys 16. Wats the ressalt? They lofe at skool fer abt. 4 yrs. lerns 2 smook cigerets & shute

Jerry on his return from the Ontario Convention tells about George Baker's, "Wot the 'ell" and other developments.

the boans & by the time theys ternd lose theyve lost respect fer onnest werk & begins to look fer a white coller job witch they aint noways fitted fur ennyways. Men is like differnt kinds of hoarses some of witch is fer hard plowin & etc. & others fer racin as some on us nose 2 our cost. You cant maik a race hoarse outta plow-hoarse nor can you maik a plow-hoarse outta a race hoarse thow judgin by the weigh some of them run they shld bee pullin a plow. If all the hoarses is race-hoarses hoo the 'ell is goin 2 do the plowin as Geo. Baker wld. say? The hole trubble with the world is weer groan 2 fussy. A lotta yung fellers thinks at monney groze on berry bushes & there developin into berry pickers. But you know Al them kinda berrys doant grow on bushes & theirs a lotta good manhood goin 2 waist waiten fer them to grow. Wen they gets tirde waitin they begins 2 talk abt. somethin bean rong with the kapilistik class & blaimes everybody but theirselves. Wimmen gets the same weigh & mennys the fine woman wat hez bean spiled by fine cloze. They doant want 2 werk fer feer of spilen there cloze but if you dont werk how yer goin 2 buy the cloze, tell me that.

I onct new a feller wat was trubble with insommnier & cldnt. sleep nohows thow heed lay in until 10 clock in the a.m. He went 2 all sortz of Drs. & they give him all sortz of doap but he grew worser insted of better. The feller worked fer the saim boss as I did & the boss begin 2 git tirde of him comin in lait lookin like the raggen end of a brewers picknick. Then the boss took him in hand.

"Get up a 5 o'clock in the a.m. & taik a long fast walk then hev brekfast. Then start 2 werk & werk like ell. The yung feller didnt like the medycine but the boss maid him taik it. Fer a cuppla days the yung feller begins 2 look like he was goin 2 die on hour hands but befoar the weak was out heed fall asleep rite after supper & wld. snoar the roof off untill the alarm went off at 5 a.m.

The young ones "loaf, lern 2 smook cigerets & shute the boans."

the next a.m. After all common scents is the best Dr. their is.

I will now say ad infinitum witch is good-bye till we meat agen in Latin.

Yours, Jerry.

INCREASING THE VOLUME AND PROFIT

(Continued from page 20)

ital, and knowing that you can borrow \$5,000.00, this will give you \$10,000.00.

Now the question is, how will it be divided according to the capital units?

The application is the same as the Expense Units to the Expense.

Bank balance, $0.04 \times \$10,000 = \400.00 at all times.

Accounts receivable, $0.02 \times \$10,000 = \$2,000.00$ at all times.

Work in process, $0.30 \times \$10,000 = \$3,000.00$ at all times.

Stock merchandise, $0.12 \times \$10,000 = \$1,200.00$ at all times.

Equipment, $0.16 \times \$10,000 = \$1,600.00$ at all times.

Autos and trucks, $0.14 \times \$10,000 = \$1,400.00$ at all times.

Furniture and fixtures, $0.04 \times \$10,000 = \400.00 at all times.

Total capital, \$10,000.00.

12 months

Monthly outlay, including expense \$ 3,000.00

Cost of sales per year 36 000.00

10 per cent. profit 3 600.00

LOOKS FOR THE PRICES

Editor, Sanitary Engineer.

"We look forward to each issue of Sanitary Engineer and read the price articles first. We also take great pleasure in reading about the different septic tank systems which are a great help to us especially in the small towns. We also make good use of pipe patterns in our line. Problems in Hydro Water pumps, etc., make good reading. We wish Sanitary Engineer the very best of success.

"Big R Sheet Metal Co.,
"Biggar, Sask."

Yearly gross sales \$39,600.00

The return on your capital in this case is 36 per cent.

Now can you do it?

Ordinarily it is only 24 per cent.

In conclusion I want to ask you just one question:

If it is impossible for you to live up to the 10 commandments, as given here, will you at least remember them and try to live up to some of them for at least one year until the next convention?

Remember and Practise These 10

1—Love thy neighbor as thyself, also thy competitor, but not his wife.

2—Include in the selling price for items—Merchandise, Labor, Expense, Profit.

3—You must have a profit even if you have to speak to your competitor about it.

4—Thou shalt not steal thy competitor's through increased volume which does not pay a profit.

5—You must receive a return on your investment.

6—You must create "velvet" and distribute same, to the betterment of efficiency.

7—It is your duty to put your ideas to work for the benefit of the sheet metal industry, creating a new demand, to offset ever-growing competition.

8—You must consider your capacity, weigh your ability and not forget that there is a limit when considering additional volume.

9—Analyze your business and find out where the pennies in your dollars go.

10—You must get together; speed up sales; keep down expenses and stop the other fellow from using your money.

Still in Doubt

Tommy had been playing truant from school, and had spent a long, beautiful day fishing. On his way back he met one of his young cronies, who accosted him with the usual question, "Catch anything?"

Tommy, in all the consciousness of guilt, quickly responded:

"Ain't been home yet."

A Feline Bread Crumber

"Mamma! mamma!" cried a six-year-old, rushing into the parlor, where his mother was entertaining some friends. "There's a mouse jumped into your bread pan!"

The good woman was much disturbed and frantically asked: "Did you take him out?"

"No'm; I threw the cat in, an' she's diggin' after him to beat the band!"

Heating and Ventilating Department

New Rulings for Public School Ventilation

Main or Trunk Ducts to Admit 1,200 to 1,800 Ft. Per Minute—Toilet Rooms to be Ventilated Direct to Outer Air by Movable Window or Skylight

AN important revision in the rulings of the Director of School Buildings applying to the ventilation of public school buildings in that district is outlined herewith.

According to the rulings previously in effect the flues and air ducts as parts of ventilating systems, it was felt, were too large and did not accomplish the desired purpose of increasing the efficiency of such systems. Another ruling required that all air for the ventilation of toilet rooms should be taken from the main ventilation system and the re-circulation of air was prohibited.

After a conference with the Director of School Buildings an agreement was reached, as a result of which the committee drew up its recommendations in the form of a letter. The announcement was made that the suggestions as offered had been found satisfactory with possibly slight modifications and would be accepted. The committee's suggestions are presented herewith:

Air Velocities

a. Vertical Supply Flues. We recommend 500 to 750 feet per minute with a flue depth of not less than 16 in.

b. Horizontal Supply Ducts. Individual ducts 800 to 1200 feet per minute. Main or trunk ducts 1200 to 1800 feet per minute.

c. Inlet Openings in Rooms. Velocity over free area of opening 300 to 400 feet per minute.

d. Vent Flues. Vent opening and flue room to be same size as supply flue and opening.

Where a so-called Unit system is employed for supplying air to room an individual vent flue should be provided with area of opening and flue the same size as mentioned above.

Every toilet room or every water closet or urinal compartment shall be ventilated directly to the outer air by a movable window or by skylight with

fixed or pivoted louvers. Every such room or compartment shall have a window or glass skylight not less than 6 sq. ft. in area, and for each additional fixture the area of window or skylight shall be increased at least 1 sq. ft.

Positive ventilation in addition to the above requirements shall be provided in pupil toilet rooms. This system shall consist of metal or smooth masonry

WELL PLEASED WITH SANITARY ENGINEER

Editor, Sanitary Engineer,

"I am well pleased with Sanitary Engineer. It keeps me posted on the prices of stock. I also like the new items and the articles on septic tanks and sewage disposal.

"R. F. Morrison,
"Morrison & McDonald,
"Summerside, P.E.I."

ducts from the individual toilet rooms or compartments direct to outdoors, and the air movement shall be induced by means of an exhaust fan or by aspiration. The air volume exhausted shall not be less than 35 cu. ft. of air per minute for each water closet or urinal. If the air is exhausted from within 2 ft. of each fixture, the air volume may be reduced to 25 cu. ft. of air per minute per fixture. No fresh air shall be supplied to toilet rooms by mechanical means.

Partial Re-circulation of Air

In order to reduce the cost of installing and operating mechanical systems of ventilation, re-circulation of air should be permitted provided the returned air be purified by an effective chemical or electrical process. Under no circum-

stances, however, should more than 75% of the total air supply be re-circulated and 25% of the total air supply should at all times be taken from out of doors.

Temperature and Humidity Control

With reference to the temperature and humidity of the air and its control we would suggest the following:

The temperature of the air in the various rooms and spaces within the building shall be maintained at all times during occupancy within the ranges given in the following schedule, except when the outside temperature renders artificial heating unnecessary. Deg. F.

Class, study, lecture and recitation rooms	64-68
Auditoriums and assembly rooms	64-68
General laboratories, domestic science rooms and manual training rooms	64-68
Gymnasiums	55-68
Offices, reception rooms, teachers' rooms, retiring rooms, libraries and lunch rooms	64-68
Corridors	58-65
Playrooms, locker rooms, wash rooms, dressing rooms and coat rooms	60-66
Toilet rooms	60-66

Control of temperature in rooms shall wherever practical be maintained by automatic means in such manner that its operation does not decrease the air volume required for ventilation.

The relative humidity of the air in the various rooms used for study purposes, shall, wherever practical, be maintained reasonably constant by automatic means, and while the school is in sessions the relative humidity of the air in these rooms must not be less than 40% nor more than 60% except when the outside weather condition renders the latter impractical.

Air Velocities in Gravity Systems

Regarding velocities in ducts and flues for gravity systems of heating and ventilating we suggest that the velocities in both the supply and vent systems be limited to not more than 300 ft. per minute with a flue depth of not less than 16 in. and an area of not less than 600 sq. in., and each vent flue should be provided with an aspirating coil, or stack stove.

**"Sanitary Engineer," the Paper That Publishes
All the News While it is News**

Steam, Vapor and Hot Water Heating

Simple Examples and Experiments—Methods of Making Connections—Why One Inch Pipe is Basis of All Heating Calculations in Arriving at Amount of Radiation Required

Written for Sanitary Engineer by EDWIN NEWSOME, Consulting Engineer
(Article No. 4 of Series—Continued from last issue)

AND now a word about the heat unit. What is meant by a heat unit and its value?

A British Thermal Unit, (B. T. U.) is the amount of heat required to raise the temperature of one pound of water at 32 degrees F. up to 33 degrees F. For instance even though a pound of water has 60 degrees and for some reason or other it was necessary to raise the pressure to 61 degrees, to do so would mean that one B. T. U. had been added.

The question as to the temperature of water in an open expansion tank, gravity job, or of steam under pressure or under a vacuum is very often put up to the heating engineer to answer. Now, water boils at sea level when it reaches a temperature of 212 degrees. If pressure is added the boiling point will of course be raised, and of course if pressure is added to a hot water system it must be done in one of two ways. First, by placing some absolute resistance on the expansion line by the use of valves or "generators," "boosters," heat intensifiers and the like, or by connecting a heating system direct on to a city water supply. A

TABLE I
Table of Pressures and Temperatures

Pressure per Square inch	Temperature of Steam or Water
0 pounds	212 Degrees
½ "	214.5 "
1 "	216.3 "
1½ "	218 "
2 "	219.6 "
2½ "	221.2 "
3 "	222.7 "
3½ "	224.2 "
4 "	225.6 "
4½ "	227.1 "
5 "	228.5 "
7½ "	235.1 "
10 "	241 "
15 "	251.6 "
20 "	260.9 "
25 "	269.1 "

certain amount of pressure can also be placed on a hot water heating system provided the building is several stories high. For example a building is about 50 feet high, or the high level of the water in the expansion tank is 50 feet above the boiler, the pressure at the boiler, registered by an altitude gauge, would be about 25 pounds per square inch

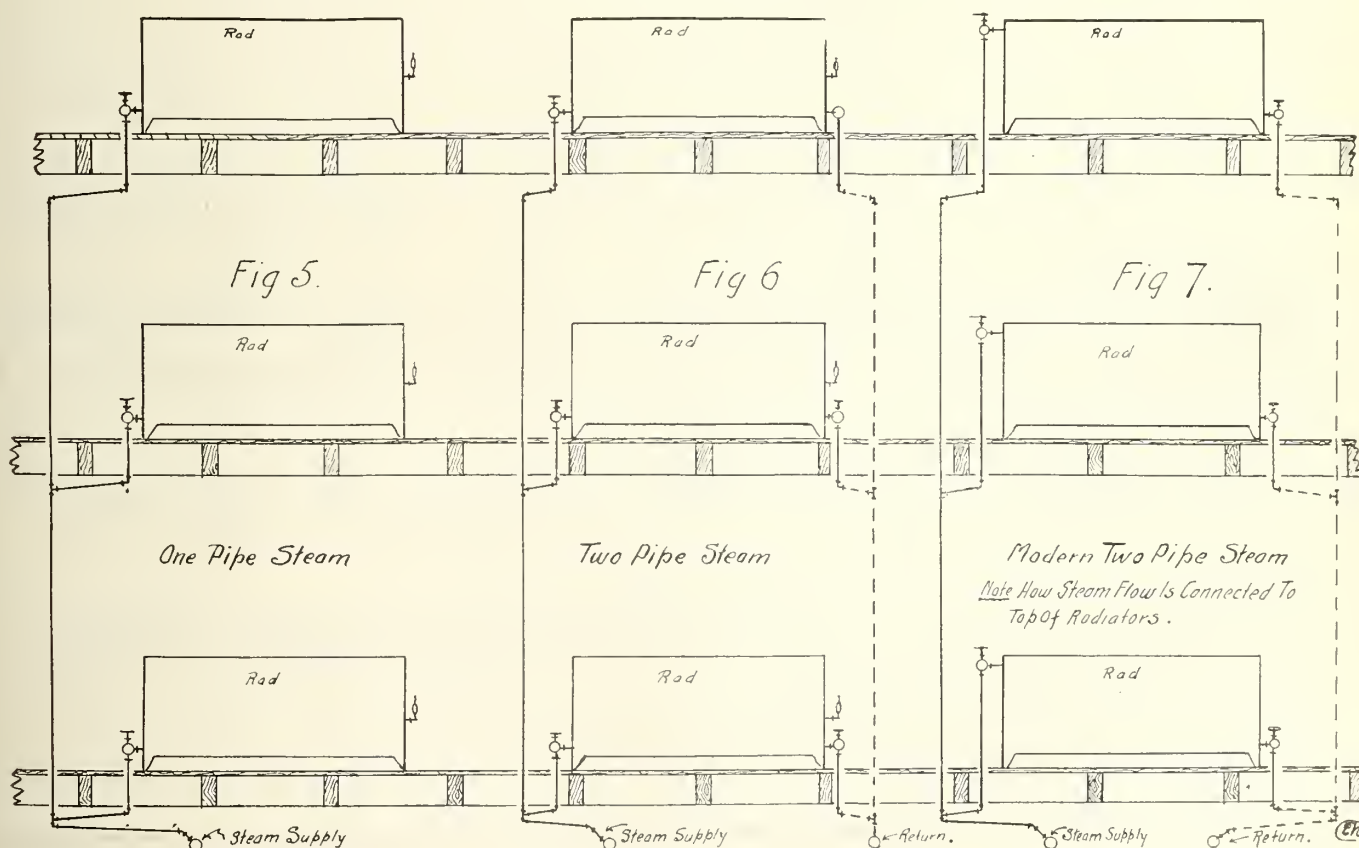

of pressure. The boiling point at that pressure would be about 270 degrees F., whereas the ordinary house is not that height and the water would not be anything like the above temperature.

Of course the use of a heat intensifier does more than assist in creating a higher temperature. But because of the lower density of the hotter water, circulation is more rapid, thereby increasing the absorption of heat units as the flame passes over and under the section or tubes in a boiler.

Just as increased head of water assists in creating a higher temperature so will a vacuum reduce the temperature or boiling point of water. Table No. 1 shows the temperature procured when water is subjected to pressures from atmospheric to 25 lbs. or equal in static pressure, creating temperatures from 212 degrees to 269.1 degrees.

Table II shows the varying temperatures of water or steam according to the vacuum created from 29.92 of vacuum to atmospheric pressure.

The question as to how a vacuum is registered or measured. A vacuum is

measured in inches, as follows: Take a tube of mercury and connect it to an air valve on a radiator, under a vacuum. The suction exerted on the tube should pull the mercury a number of inches up the tube.

But if a perfect vacuum were created it would raise the mercury 29.92 inches. Hot water or steam under a perfect vacuum would only have a temperature of 98 deg. F. But it is seldom if ever that a heating system could be kept so very tight that a perfect vacuum could be maintained. The average vapor steam or vacuum steam system will operate at a few ounces of vacuum and the water or steam will be approximately 203 to 210 degrees F.

TABLE II

A Little About Chimneys

It would be safe to state that a great deal of trouble with a heating system can be traced to the chimney. Chimneys appear to be one part of a building most neglected, or rather that is given the least attention. Some architects just build any kind or size of chimney and place it in the most ridiculous position. As a matter of fact, the chimney is the lung, chest, breather all combined and its importance to a heating system cannot be underestimated.

The question as to the shape of a chimney is important, too. Round chimneys are always the best. They should be lined with regular standard round chimney linings and in order the next best is a square chimney, next a rectangular one, and in no case should there be any other opening for fireplaces, stoves, etc., taken off the same, and no chimney should be less than 8

TABLE III*
Size of Chimney Flues

Cubic feet Contents of Buildings	Square feet Direct Steam Radiation	Square feet Hot Water Radiation	Round Tile or iron in Inside Inches	Square or Rectangular Tile or Brick
200,000-350,000	3,500 to 5,000	5,200 to 8,000	18 " "	16 x 20 " "
10,000- 20,000	250 to 450	300 to 450	8 inches	8 x 8 inches
20,000- 45,000	450 to 700	800 to 1,200	10 " "	8 x 12 " "
45,000- 75,000	700 to 1,200	1,200 to 2,200	12 " "	12 x 12 " "
75,000-140,000	1,200 to 2,400	2,200 to 3,600	14 " "	12 x 16 " "
140,000-200,000	2,400 to 3,500	3,600 to 5,200	16 " "	16 x 16 " "

*Frank R. King, 500 Questions and Answers.

inches in diameter if round, or 8 inches if square. Neither should a rectangular chimney be too narrow. For example, a 4 x 12 would be out of proportion. A rectangular chimney should never be narrower than 25 per cent. of its width, such as say, 8 x 12 or 12 x 16 or 16 x 20, and so on. The size of a chimney governs the area, and the height the capacity; and to add to the drawing power of a chimney it is always advisable to lengthen it.

One other thing to avoid when erecting a chimney is to see that the top is always one foot at least higher than the peak or ridging of a house and that no tree or trees are so located as to constitute a "windbreak." Not long ago the writer was called in to see a heating system that as the owner said was losing its draft. It was found that a few feet from the chimney side of the house a poplar tree "windbreak" had grown up and so interfered with the chimney that it would not "draw." The trees were cut down and the system has been working well ever since.

The size of a chimney should be based upon the combined area of the rooms to be heated and the grate area of the furnace. For instance, suppose that the furnace is fitted with an 18 inch grate (round). The area then would be about 255 square inches, the chimney not less in area than one-eighth of the total area, but in no case less than 8 inches in diameter, or 8 x 8 in. square. The ac-

companying table, Number 3 will be as good a guide as possible to follow out. These figures, however, are good only for steam or hot water heating systems, and in every case where possible no offsets should be allowed in a chimney, always giving preference to glazed tile chimney linings and being round where possible. The joints should all be cleared of lime or mortar and the tile, so as to eliminate friction of air or smoke.

(To Be Continued)

PLUMBERS OF HULL AND OTTAWA NOW HAVE NEW CONTRACT

The contract was signed with individual master plumbers of Hull and Ottawa. About 60 working plumbers are involved.

NEW SCALE OF PLUMBERS' PRICES IN PORT ARTHUR

A new scale of plumbers' prices for repair and day work in Port Arthur, became effective March 1 as follows:—

Skilled mechanic, plumber or steam-fitter, \$1.50 per hour; helper, \$1.00 per hour; apprentice, 1st, 2nd, and 3rd year, fifty cents per hour. The agreement is signed by R. S. Shaw, H. R. Sime, Geo. Bell, George Purvis, James A. Stirling, H. MacRae, L. A. Greene & Co., and Lakehead Engineer Co., J. W. Barnes. The scale in Fort William is fifteen cents per hour less.

COMMENDS QUICK SERVICE ON ONTARIO SOCIETY CONVENTION REPORT AND INTERESTING PHOTOS

Hamilton, Ont.

Editor, Sanitary Engineer, Toronto,

I have read with much interest your splendid report on the last convention of the Ontario Society Domestic Sanitary and Heating Engineers. You are to be complimented on getting out such an interesting report to the trade so soon after the convention.

The photographs of various groups of men attending the convention. (as arranged exclusively by the Sanitary Engineer photographer), were also very interesting and helped one to "live the convention over again" after returning to work.

Your efforts to give the trade the best and quickest service on all such meetings are very commendable.

(Signed) A TEN YEARS' SUBSCRIBER.

Selling the Farmer City Conveniences

One of the Many Reasons Why Farming Districts Are Being Depopulated is That City Conveniences Are Not Installed in Farm Houses—Sanitary Engineers Can Cultivate This Almost Unlimited Field for New Business

By EDWIN NEWSOME, Contributing Editor Sanitary Engineer and Lecturer on Rural Sanitation for Department of Agriculture, Ontario

(Continued from previous issue)

IT is an actual fact that out of 181,978 pleasure cars (not including trucks) in use in Ontario, more than 64,000 are owned by farmers. Out of over 64,000 less than 200 of these car owners live in "plumbed" homes, and why? Because the auto salesman has said, "Get away from the drudgery of farm work, buy a car and take your wife and family out for a ride, go into the city, park your car somewhere and go to a movie show, ride around a well lighted city and see life. Don't be cooped up every day in the loneliness of the bare walls, barns or cow-byres, with their obnoxious odors, etc. I can sell you a car for a thousand dollars or so, and gasoline is cheaper than horse feed. You can pay so much down and so much per month. We can trust a man like you, Mr. Farmer, because we know every mother's son of you are producers and workers of the highest type," and so on.

And what has the farmer way back in his mind? The yard pump, the dirty, stinking privy, the back yard where all the kitchen slops are dumped, the flies, mosquitoes, the wood stove and the coal oil lamp, no hot water ready to hand, a broiling hot kitchen in summer, every time a drop of water has to be heated, no bathtub, no city comforts of any kind, in fact.

"Of course, I'll buy a car," says the farmer, "and of course I'll drive the wife and family out to see the sights of the city; anything to get away from the drudgery of such conditions." Those are the very pictures true to life that are painted in the mind's eye of every car-owner-farmer. And who's to blame? What kind of a story could a live salesman of sanitary and heating goods tell? Here's one.

"What? Buy a car? For the price of a car I can put in your home as fine a bathroom, with w.c., etc., as any city home contains. I can put a fine white cast iron enamelled sink in the kitchen fitted with nickel-plated taps, hot and cold water. I can sell to you a pneumatic water system, install a sanitary septic tank and sewage disposal system, to dispose of the waste from all the plumbing fixtures, every bit as elaborate and as sanitary as any city home is fitted up. Yes, and a furnace could be fitted up in your basement. All for the price of a car. Would you rather buy a car and travel far to enjoy the pleasures of a few fleeting hours that after all are only as drifting sand? Would you not prefer city conveniences in your home twenty four hours a day, to the imaginary and far less valuable pleasures of a few fleeting hours once or twice a week?"

A Profitable Duty

There's your duty, Mr. Member of the Sanitary and Heating Industry. Your duty and your opportunity to better conditions on the farm, to improve conditions for every mother living a life of solitary drudgery; every mother of the farmer-to-be.

Can one wonder at the depopulating of our rural district? Can one wonder at the young folk on the farm leaving home and swelling the population of our cities?

To take a trip into the country and pay a visit to a farmer whose home has already been fitted up with city home conveniences, then call upon a farmer whose family do not know the blessings of plumbing and sanitary equipment, is the most convincing argument of all that farmers do really need all such comforts as our industry can give them.

Do we sanitary and heating engineers realize that farm woman power means drudgery? Do we see the good we can accomplish from a humane standpoint by straining every nerve to help the mothers of the rising generation of farmers? It is the farmers who feed the population of our cities, the artisans, the makers of things. And if the mother is assisted, if her work is made a pleasure, then her babies are very apt to live and love their labors when they grow up, because she (even when her babies were yet unborn) was contented, happy and interested in her work.

On the other hand, what can we expect of the offspring of a mother who is nothing better than a drudge, a being who has to contend with such inconveniences as arise from having no kitchen sink, no wash basin, a dirty, stinking privy, etc., etc. The question of furnishing city convenience in every farm home is of national importance; and every health department ought to treat a farm home as they would a home in the city.

A city home without proper sanitary appliances installed therein is not tolerated. Such homes are placarded, "Insanitary, unfit for human habitation," and no city house can be erected unless a complete bathroom, kitchen sink, etc., is installed at the time it is built. Then why such conditions on a farm?

A Few of the Craft Realize the Opportunities

Not very long ago I visited a small country town in which a member of the trade has established a business and found that in less than two years he had installed 48 pneumatic water systems, and complete bathroom and kitchen con-

(Continued on Page 30)

Can You Use Some Booklets on This Subject?

SANITARY ENGINEER has a limited supply of booklets in convenient size setting forth the matter contained in this article. It will explain to your prospects the need for sanitation in rural districts and the plan of the Ontario Government for assisting farmers to pay the expense of such installations.

You will have to hurry to get your order in for some of these booklets as the supply is limited. Write the Editor, Sanitary Engineer, 143 University Ave., Toronto.

Ridiculous Demands

ANOTHER period of inflation seems to be developing, particularly in respect to the building industries, though a halt in building progress in certain parts of the country due to high costs has put somewhat of a brake upon it in these parts. Wages are continually going up. It is urged that the increased wage payments will greatly increase consumption but the increases are all added to what somebody must pay and count just as much for the restriction of purchases as for increasing them.

There are no gains from raising money-wages except as there are inequalities in the advances, some groups of workers getting their compensation raised at the expense of others. Such benefits are neither general nor permanent, for in the long run the economic law will find a way of equalizing conditions.

There are some inequalities in money-wages but there will be more, if many of the demands for increases are met that are being made by organized labor. Particularly is this true in the building industry and in our own. The demands of plumbers, steamfitters and plasterers in many localities, particularly across the border, are so ridiculous that if granted they will certainly bring an inflation that will soon explode.

The Old Suspicion

THERE are splendid possibilities in the rural field for plumbing and heating equipment and the effort being made by the Ontario Government to improve sanitary conditions in these sections is very creditable. It is a shame that, like many other such efforts, the plan has been referred to by some as a political scheme for vote catching just prior to election. Among certain branches of the industry there has also been the feeling that such effort was done to encourage the farmer to "be his own plumber." Either lack of interest or due to the latter sentiment plumbers have not been taking as much advantage of the lectures being given by the Ontario Government as they might do. Few plumbers have attended the lectures and when approached by the Government lecturer others have shown little interest and one said "the people know where I am if they want me."

This spirit is the reason why the Ontario Government has had to take a hand in connection with rural sanitation. True it might not be profitable for plumbers to spend a great deal of time endeavoring to develop prospects in all rural districts, some of them are too sparsely settled for that, but there are many towns and villages and thickly settled rural districts where such work could be done profitably. It is being done

profitably by many progressive plumbers, but it is not done by those who employ the sentiment expressed by the plumber mentioned.

Plumbers who are keen for business realize the value of the spade-work being done by the Ontario Government lecturers and are on the job to cash in on it. A number of such plumbers have taken orders for considerable business at some of these lectures.

The old spirit of suspicion in the plumbing industry has disappeared among those who are actively digging for business. They haven't time for suspicion and talk of poor conditions, and as result they have little to complain about. The work undertaken by the Ontario Government can be turned to great advantage by plumbers—and there is no reason for its being looked upon with suspicion by any in the industry.

"Engineer Smith"

SOME recommendations worthy of attention by the industry have been made by George C. Whipple, Professor of Sanitary Engineering at Harvard Engineering School. It is pointed out that the term sanitary engineer was originally applied to engineers who had to do with sewers and drains, but now the field has expanded to include not only sewers but sewage treatment, water purification, etc. To-day the sanitary engineer must have some understanding of the relation between sanitary works and the public health and between the cost of works and sanitary value. It has been suggested that such a man should be called a public health engineer. This is merely a translation of sanitary engineer and does not seem to be worth while to multiply names and titles without adequate reason.

The suggestion has been made that sanitary engineers might better be known as civil engineers or even as engineers, just as public health officers are known as doctors. The same dignity, honor and importance might be attached to a plumber known as "Engineer Smith" as to that of "Doctor Smith" assuming, of course, that the title "Engineer" represents an engineering degree, membership in a national professional society or some other adequate standard of attainment.

"From my experience, I believe that in a health department the work of the sanitary engineer is of importance equal to that of the doctor of medicine," said Mr. Whipple, pointing out that the lack of recognition of equality is one of the reasons why some of the best young engineers hesitate to enter Public Health Service to-day.

All Eyes on the West

ONE of the most encouraging features of the present business outlook is the present crop prospect throughout Western Canada. This is an all important matter in the business interests of Canada, and the continuation of gradual improvement which has been taking place for some months past, will be gauged to some extent by the value of the crop to be harvested in Western Canada this fall.

Advices from Sanitary Engineer's representatives throughout Western Canada are to the effect that the frequent rains have given good grounds for enthusiasm as to the probable crop results. It is stated that nothing but hail will prevent Alberta from duplicating 1915 in her yields. The moisture coming after the grain is fairly well up will reduce the amount of moisture carried off by the winds from now on. Tradesmen in various Western cities feel that a new era of prosperity for the West is dawning, that the long period of drought has been ended.

MINUTE MESSAGE

Number Sixteen

Written for "Sanitary Engineer" by FRANK STOCKDALE

Co-operation Series

They'd Both Get Farther If They'd Make It 50-50

IN THE picture above you have the reason why so many co-operative enterprises fall down. The illustration applies to organizations of every kind.

Sometimes it is an organization of merchants that fails to accomplish its purpose because a few men must do the work for all.

There is a limit to the strength and the patience of even the most ardent believer in the power of organized effort. In fact, there is no effective organized effort without due consideration being given to the principle of 50-50.

51-49 and other unequal or unfair divisions of labor wreck more organizations than all other things combined.

The value of organization lies mainly in the fact that many can do things that a few cannot do. The organization is weakened when any one man fails to do his share. Not only is it weakened and unable to accomplish immediate results, but its life and usefulness are made shorter.

The principle applies in your shop just as it does to any outside organization to which you may owe support. It is a big, broad, practical principle that every merchant should use to improve his store and his town. 50-50 is the business man's version of the Golden Rule.

THINK IT OVER--APPLY IT TO YOUR BUSINESS

All Rights Reserved by Sanitary Engineer for Exclusive Publication
in the Plumbing Trade in Canada

Twenty Years Ago

Following items are reproduced from the trade paper files of MacLean Publishing Co. of June, 1903:

"At the regular meeting of the Master Plumbers' Association of Toronto, A. E. McCauley was initiated."

* * * *

"Bennett & Wright Co., Ltd., are busy. They are doing the plumbing and heating in the Alexander Apartment building on University Ave. It is said that this contract is over \$50,000. The firm is making considerable alterations to premises on Queen St."

* * * *

"Members of the plumbing fraternity honored John R. Minihinnick, who was formerly in the plumbing business, on his election as president of the London Board of Trade. He is still interested in the trade having helped organize the Empire Mfg. Co. of London."

* * * *

"A meeting of members of the Toronto Master Plumbers' Association interested in baseball was held. Frank Maxwell, of Maxwell & Johnston, was appointed captain. The team will practise at the Woodbine. George Clapperton is the secretary and all challenges should be sent to him. A challenge is being issued to the Mountain (Hamilton) Association, to meet on neutral grounds in Oakville."

* * * *

"Master plumbers and steamfitters of Sydney, C.B., are now organized into an association. Frank Powers of Lunenburg, N.S., president of the National Association, was present to enthruse the new members. The following firms identified themselves with the new association: Bayer & Co., Baristo & Co., H. G. Hagen & Co., Estans & Co., E. L. Martin, Chas. Kirk, J. J. Brownlee, Keith Ball, F. H. Jones of Sydney, Thompson & Matheson, Shean Bros., Will Buchanan of North Sydney and Keith Bros., Glace Bay."

SELLING THE FARMER CITY CONVENIENCES

(Continued from page 27)

veniences in that number of rural residences and a few of the number in farm homes. This same sanitary engineer succeeded in getting a school board to change the plans of a school they were planning to build. At first the board had decided to have some outside privies built, but finally had up-to-date lavatories for girls and boys, and a separate one for teachers, all installed, and the school heated by a modern steam plant. This change was largely brought about by the fact that one of the members of the board, a farmer, whose children were going to attend the new school, took exceptions to his children using a privy when it was just as easy to install proper sanitary fixtures, w.c.'s, etc.

How Can We Procure this Business?

The question of catering to the farmer is not by any means an easy one, yet the automobile manufacturer is doing it. The average manufacturer of plumbing and

heating supplies has never given the subject of advertising the attention he ought to do. He blames the plumber, by saying, "It's no use trying to educate the plumber to become a salesman." But, as a matter of fact, I'd like to know of one who ever tried. One can pick up daily papers by the score and never see one advertisement of a modern bathroom, and no manufacturer would ever dream of incurring the cost of conducting educational classes as do auto manufacturers, typewriter, or cash register manufacturers.

A firm of auto manufacturers in Toronto have a class made up of their own workmen out of the shop and these men take up assembling cars in a special school room. Not only are these men taught all about the mechanism, but also are given sales talks and a regular course in salesmanship. Such methods have never been tried in the plumbing and heating business.

The Ontario Government is taking a great deal of interest in this question. Students, sons and daughters of farmers attending the O.A.C. are given special lectures as part of their studies relating to the why and wherefore of "A bathroom in every farm home." This government is even doing more. An experienced sanitary and heating engineer is now giving lectures to short term classes in a number of Ontario towns to farmers' sons and daughters who cannot attend the college at Guelph. This work should be followed up by the plumbing trade.

First of all, the farmers ought to see more advertisements in their farm papers describing sanitary conveniences. Next, sales articles and classes ought to be formed by the manufacturer, and a closer relationship should exist between the various branches, advertisements appearing in trade journals should contain educational "copy." Every traveler ought to have a copy of the trade journal supplied him, and he ought in turn to draw the attention of members of the craft to sales articles published from time to time. Special catalogues should be gotten up for farm trade, and each one should contain views of fully equipped bathrooms and other city conveniences, regular calls should be made on farmers, or a letter once in a while to farmers telling the story of good plumbing and heating on the farms and so on. Men calling upon farmers would require to be "hand picked," and no doubt more business could be procured from the farmer than now is.

Talk Bathrooms as an Investment

I have quoted at length all about a farmer owning a car. Now, is a car an investment in the eyes of a farmer? It may be if a high value is placed on pleasure and joy riding, but no matter from what angle the question is viewed, an auto is a constant liability, and upkeep

(Continued on page 40)

No, They Don't Burn Coal

He: "I just read an account of two girls getting lost in the Alps in mid-winter."

She: "Terrible! Were they frozen?"

He: "No, they warmed themselves on the mountain ranges."

* * * *

Always exercise a certain amount of care in sympathizing with a woman in tears. She may be having the time of her life.

* * * *

Impossible

"John, John," whispered Mrs. Congressman Blow Hard, "Wake up! I'm sure there are robbers in the house."

"Robbers in the house?" he muttered sleepily, "Absolutely preposterous! There may be robbers in the Senate, Mary, but not in the House. Absurd!"

* * * *

Missionary (to cannibal)—What makes your chief so talkative to-day?"

Cannibal—Oh, he ate a couple of barbers this morning.

* * * *

Sounded Like Home

Two young kindergarten teachers, intelligent and attractive, while riding downtown in a street car were engaged in an animated discussion. In the seat behind them sat a good-natured, fatherly-looking Irishman enjoying a nap. Finally one kindergartner inquired of the other:

"How many children have you?"

"Twenty-two," she replied. "And how many have you?"

"Oh, I have only nineteen," replied the first.

At this point the Irishman, now wide awake with astonishment, leaned forward in his seat, and without any formality, inquired in a loud voice:

"What part of Ireland did youse come from?"

* * * *

Lucille: "What is it that keeps the moon in place and prevents it from falling?"

"Buck:" "I suppose it's the beams."

* * * *

Sunday School Superintendent—"I am happy to see all these shining faces before me this morning." (Sudden application of thirty-seven powder puffs.)

News Notes From Coast to Coast

BUSINESS CHANGES

Montreal.—Lafontaine & Courtemanche, plumbers, have dissolved.

Swift Current, Sask.—Hutchinson & Morrison, plumbers, have dissolved partnership. Morrison continues.

NEW FIRMS

Hague, Sask.—H. H. Henrichs is commencing a tinsmith business here.

Kenton, Man.—Chas. A. Bell has commenced a tinsmith business here.

Ottawa, Ont.—Chas. Schwabe and Co., plumbing and heating, have opened at 471 Gladstone Ave.

PERSONAL

O. B. Mueller, president, and William Twaits, sales manager of the H. Mueller Manufacturing Co., Ltd., Sarnia, attended the convention of the American Waterworks Association in Detroit. A large number of Canadian waterworks superintendents are members and a large number of Canadians are in attendance.

PLUMBING BY-LAW FOR DISCUSSION

St. Boniface, Man.—A further reading of the new plumbing by-law, declared to have been drafted against the wishes of many St. Boniface plumbers, will take place. This by-law, which conforms to other by-laws in the Greater Winnipeg Water district, of which St. Boniface is a part, means, if it is passed, that St. Boniface plumbers will have to stock equipment to conform to the by-law.

CO-ORDINATE VANCOUVER SANITARY INSPECTION

Vancouver, B. C.—Plans for the co-ordination of the different divisions of the civic health department with a view to rendering more efficient community service have been presented to Dr. F. T. Underhill, M.H.O., and to the city clerk by Laurence Robertson, recently appointed chief inspector of the department.

If the recommendations filed with the city clerk are endorsed by the medical health officer and the city council, Mr. Robertson will be known as the sanitary inspector, the term "chief" being dropped. He will be responsible to the medical health officer for the smooth working of the five main subdivisions of the department. At the head of each of these divisions will be a deputy sanitary inspector.

Next in order of precedence will come 11 assistant sanitary inspectors, each of whom will be assigned to one particular division in the first instance.

Doings in the Plumbing and Heating Industry

FIRE LOSS

Sussex, N. B.—G. W. Myers, plumber, suffered fire loss.

MOVE TO NEW PREMISES

The office of Galt Brass Co., Toronto, has been moved to 85 Church Street.

CONTRACTS AWARDED

Messrs. Higgins & Large, Brampton, Ont., have plumbing and heating contracts for the new public school.

NEW FILTRATION PLANT

Kitchener, Ont.—Work on a filtration plant which will serve all the border municipalities will commence within a month. The plant will have sufficient capacity to take care of the needs of 300,000 people.

WILLIAM C. COLLS

William C. Colls, a Northwest Rebellion veteran, who died in Toronto after a few week's illness. Born at Woolwich, England, he came to Canada as a young man and answered the first call for volunteers to fight the rebels. He joined "G" Company of the Grenadiers—and fought throughout the whole of the campaign, including the battle of Batoche. Returning to Toronto, he went into business as a plumber.

NEW FIRMS

Chivers Bros. are the proprietors of a newly established plumbing business at Grimsby Beach, Ont.

ONTARIO GOVERNMENT DEMONSTRATION TRUCK HAS VISITED THE FOLLOWING PLACES

Cooksville, Clarkson, Hamilton, Milton, Palermo, Waterdown, Rockton, Sheffield, Mount Hope, Smithville, Welland Port, Vineland, Virgil, Ridgeway, Crowland, Fenwick, Marshville, Canboro, Cayuga, Selkirk, Jarvis, Tyrrell, Marburg, Delhi, Courtland, Alymer, Union, Dutton, Rodney, Ridgetown.

ENTERTAIN DOMINION RADIATOR STAFF

The Dominion Radiator Company's office staff, and heads of various departments, Toronto, were entertained to a banquet in the King Edward Hotel by the president, Joseph Wright. Peter McMichael, the retiring managing director, was presented with a personal gift by Mr. Wright, and a presentation was also made by J. N. Shenstone on behalf of the board of directors. A gift from the staff was presented by ex-Alderman Sam Ryding.

E. G. PARKER IS HEAD OF WESTERN C. M. A.

Winnipeg.—E. G. Parker, manager of the Royal Crown Soap Company, Winnipeg, was elected chairman of the prairie division, Canadian Manufacturers' Association, at the annual meeting held in the Royal Alexandra Hotel. H. B. Lyall was elected vice-chairman. About 100 members of the association attended the meeting.

Major E. G. Rogers, the retiring chairman, presented the annual report of the executive in which he recommended a meeting of members of the prairie division from Manitoba, Saskatchewan and Alberta, be held outside of Winnipeg at an early date for the purpose of considering problems relating to industrial development in the West.

PLUMBERS HAVE NARROW ESCAPE

Robert Paton, superintendent for Bennett & Wright, of Toronto, and Edward Robinson had a miraculous escape from death when a car in which they were driving to Delaware turned turtle and pinned both underneath. Mr. Paton escaped with a few minor bruises, while Mr. Robinson is confined to his bed at his home in Toronto, suffering with severe bruises about the head.

The two men were delivering a bath tub to a home in Delaware and when near their destination one tire blew up. The car immediately turned over.

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

FEWER price changes have occurred during the past two weeks than in any previous half-month this year. The market is becoming more steady as far as prices are concerned. Dealers could handle more business than they have been getting lately and some centres report that no improvement has been noted over last week's business. Districts situated in Western Canada report a slight increase in trade. The crop outlook has no doubt got something to do with the trade stimulation that is being felt.

The advance in soil pipe has been noted in Quebec and Western Canada in this issue. This took place a few weeks ago in Ontario centres. Advances in some lines of scrap are noted, also some declines in these lines, but no changes of note, either way are recorded. A change in discount on conductor elbows, cut offs, strainers, tubes and conductor hooks took place which makes these goods about ten per cent. higher in price.

Some centres report that credit conditions and collections are becoming better.

Montreal Markets

MONTREAL, June 14.—Prices which have been in force for some little time back have been maintained almost without exception during the past week. The sole change of any note is to be found in the scrap metal market where easier quotations are issued on several metals, following the trend of primary metal markets.

Trading in most lines continues to improve steadily, but on all sides is heard the same tale—the season has been so slow in opening up that things are still a month behind where they should be.

ENAMELLED WARE TRADING IS FIRMING UP

Montreal.

As in other lines connected with the building trade, business in enamelled ware is reported to be on the up-grade, though the demand is later this season than is usually the case, the late spring accounting for this. Prices are unchanged as follows:

ENAMELLED WARE—

Sinks, flat rim—	1 only	2 only	3 only
16 x 24	\$ 7 50	\$ 7 40	\$ 7 30
18 x 30	8 70	8 60	8 50
20 x 30	9 90	9 80	9 70
Bath tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide	51 40		
Bath tubs, 5½ feet.	57 10		
Lavatories—			
17x19 in. Apron F139 or P4045.....	15 30		
18x24 in. Apron F154 or P2845 or P3847	23 60		
18x21 in. Apron F169 or P4205.....	17 60		
17x19 in. Roll rim. F241 or P4345.....	12 60		
Less 30 per cent.			

STEADY TONE IS MAINTAINED IN CEMENT MARKET

Montreal.

Building activity in this district is providing a steady call for cement, according to local distributors, who state that sales are good at the present time. The following prices remain in force:

CEMENT—

Car load lots, per bag, F.o.b. steam cars	0 86

Vitreous china tank with fittings, flush elbow and supply	16 00
Enamelled iron with fittings, flush elbow and supply	16 00

NUMEROUS LOWER PRICES ARE NOTED IN SCRAP MARKET

Montreal.

A number of lower prices are noted in the scrap metal market this week, the changes including the following: red brass, from 2½ to 2c.; light copper, from 10½ to 10c.; heavy copper, from 13½ to

12½c.; rubber shoes, from 2½ to 2c.; heavy melting steel, from \$13 to \$12; No. 2 busheling, from \$7. to \$6, and No. 1 machinery cast, from \$24 to \$21. Local market quotations are as follows:

SCRAP—

Automobile Tires	0 50
Rubber Shoes	0 02
Yellow brass	0 07½
Red brass	0 09½
Light brass	0 05
Scrap zinc	0 05
Lead, heavy	0 05
Lead, tea	0 03¾
Light copper	0 10
Heavy copper	0 12½
Wrought iron, R. Rd. No. 1 per gr. ton	15 00
Malleable scrap (ton)	18 00
Pipe scrap (ton)	10 50
Heavy melting steel	12 00
No. 2 busheling	6 00
Boiler plate	14 00
No. 1 machinery cast	21 00

STRONG DEMAND CONTINUES IN CORRUGATED SHEETS

Montreal.

Corrugated sheeting continues to find a good demand in the local market, quotations being the same as those which have ruled for some time past, which are as follows:

CORRUGATED SHEETS—		Per 100 sq. ft.
No. 28 gauge	7 00	
No. 26 gauge	7 50	
No. 24 gauge	10 00	
No. 22 gauge	12 50	
No. 20 gauge	14 00	
No. 18 gauge	19 00	
Less 10 per cent.		
Lighter than 24 gauge and wider than 27 ins.,		
75 cents per square extra.		

STEADY ACTIVITY REPORTED IN METAL LATH MARKET

Montreal.

The metal lath market shows no change during the past week, trading being fairly steady and prices remaining unchanged at the following levels:

METAL LATH—		per sq. yd.
Painted—		
26 gauge	23c.	
24 gauge	25c.	
32 gauge	32c.	
Galvanized, 10c. per sq. yd. extra.		

COTTON WASTE MARKET SHOWS STEADY IMPROVEMENT

Montreal.

The cotton waste market has improved steadily since the opening of navigation, the continually increasing number of ships coming into this port enlarging the market for wastes. Prices are maintained at the following levels:

COTTON WASTES—		Per lb.
Cream polishing		0 24
White, XXX extra		0 20
White, XX grand		0 18½
White, XLCR		0 17
X Empire		0 15½
X Press		0 14

Lion		0 14
Standard		0 12½
Popular		0 10½
Keen		0 08½
Wool Packing—		
Arrow		0 25
Axle		0 21
Anvil		0 17
Dominion Wipers—		
White cotton		0 20
Colored cotton		0 13½
F.o.b. Toronto and Montreal.		

LIGHTER TRADING REPORTED IN SHEETS AND PLATES

Montreal.

The summer slackness is beginning to make itself felt locally in the sheet and plate market, although there is still a good volume of business being

transacted. While indications in the English primary markets point towards an increase in price this has not been felt locally as yet, the following quotations still ruling here:

GALVANIZED SHEETS—

	Queen's Head	Fleur de Lis
18-20 gauge	6 90 7 40	6 65 7 15
22 gauge	7 15 7 65	6 90 7 40
24 gauge	7 25 7 75	7 00 7 50
26 gauge	7 50 8 00	7 25 7 75
28 gauge	7 75 8 25	7 50 8 00

Other Brands—

10½ oz.	7 50	7 75
28 U. S. gauge	7 20	7 50
26 U. S. gauge	6 55	7 10
24-22 gauge	6 60	6 85
20-18 gauge	6 40	6 50
16 gauge	6 25	6 35

Above prices are for ½ ton lots in English iron and 1000 lb. lots in American iron with an extra charge of 25c. for less quantities. Extra for sheets 3 ft. wide, 28 gauge and 10½ oz., 25c. per 100 lbs.

Further extra for sheets 4 ft. wide according to gauge.

TIN PLATE—

20 x 28 x 100 lbs. basis	15 50
20 x 28 IC, 112s	16 00
20 x 28 IX, 112s	18 00

20 x 28 IXXX, 56s	12 00

TERNE PLATE—

20 x 28 IC, 112s, 200 lb.	14 50
20 x 28 IC, 112s, 214 lb.	15 00

CANADA PLATE—

Half bright 52s	5 50
Half bright 60s	5 60
Blued 52s	5 90
Blued 60s	6 00
Welsh, polished, 60s	7 35
Welsh, polished, 52s	7 10
Galvanized, 52s	8 00
Galvanized 60s	8 50

SOIL PIPE AND FITTINGS ARE AT HIGHER LEVELS

Montreal.

Reductions in the discounts on several sizes of soil pipe and fittings are announced this week. On pipe the former discount was 33-1/3 per cent. and on the fittings 45 per cent. Discounts on 8-inch pipe and fittings remain without change, the following being the revised list of discounts:

SOIL PIPE—		
2 and 3 inch	20%	
4 inch	25%	
5 and 6 inch	20%	
8 inch	net	
FITTINGS—		
2 to 6 inch	37½%	
8 inch	net	

QUIET TONE PREVAILING IN RADIATION GOODS

Montreal.

The radiation goods market is without feature this week, a quiet tone prevailing. Prices are at the same levels as have ruled for some time past, as follows:

RADIATORS AND BOILERS—

Radiator list prices are for 1, 2, 3, 4 and 5 column radiators, per sq. ft.
45 in. to 38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60. Discount 44 per cent for hot water, and 45 per cent. for steam.
Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05; Discount 41 per cent.

Boilers—Round & water boilers, sizes from 0 to 10, 52 per cent. off list. Square or sectional hot water or steam boilers, 15 in., 3 per cent. with Ontario Government trimmings, list. Square or sectional water boilers, 19 in. to 36 in., 8 per cent. Square or sectional steam boilers, 19 in. to 26 in., 5 per cent. Ontario Government trimmings, list plus 7 per cent. Square or sectional water or steam boilers, 48 in., list plus 10 per cent. With Ontario Government trimmings, list plus 18 per cent.

Round steam boilers, standard trimmings, 16 per cent. Ontario Government trimmings, 13 per cent.

F.o.b. Montreal, Toronto, Guelph.

BAR PRODUCTS MARKET SHOWS NO PRICE ALTERATIONS

Montreal.

Steady activity continues in the local bar product market. Prices have not undergone any alterations for some weeks past, remaining at the following levels:

IRON AND STEEL—

Common bar iron, 100 lbs.	3 95
Refined iron	5 45
Irish finish machinery steel	4 00
Mild steel	3 95
Single reeled machinery steel	5 50
Band steel	3 95
Sleighshoe steel	3 95
Spring steel	6 00
Tire steel	4 15
Harrow tooth steel	3 80
Toe caulk steel	4 85
Mining tool steel, per lb.	0 19
Black Diamond tool and cast steel, per lb.	0 19

NOTE.—Refined iron is approximately \$1.50 per cwt. over base, but fluctuates owing to unsettled market.

Band steel in scroll bundles, 50c per 100 lbs. extra.

Iron and steel 3-16 in. and thinner, 50c per 100 lbs. extra.

LITTLE CHANGE IS NOTED IN INGOT METAL MARKET

Montreal.

The metal market generally has been quiet during the past week with indications that the bottom has been reached in most lines and there are signs of a slight improvement evident. It is probable that there will not be any marked change from present levels until buying asserts itself once more but with confidence restored this should be more or less in evidence in the near future.

TIN.—The changes in the price of this metal have been only nominal and do not indicate any particular trend in either direction. The market may be termed as dull and nominal as there is little buying demand, although, should there be orders of any volume, this would be reflected in the price. With hand-to-mouth buying existing as at present little change in price may be expected. The local market is quiet at 48½ cents per pound.

COPPER.—This metal has recorded some improvement this week, the London market advancing daily and New York also being higher. Sales of metal for export are reported to be fair and with hope for a settlement of the reparations question it is thought that this will be followed by a good demand from Europe. Electro is now quoted at 15½ to 15¾ cents delivered and the demand is good at this level. The local market is firm at 20½ cents for electro and 20 for casting.

LEAD.—This metal remains remarkably steady, the London price showing a change of only five shillings per ton in the past ten days while New York is also practically unchanged. Demand and supply appear to be fairly well balanced and consumption remains quite large. The local market is quiet at 8¼ cents per pound.

SPELTER.—This metal is really the weakest on the list, owing to heavy production in the U. S. A. and fairly free offerings from the continent. This metal has also been affected by the Ruhr situation and it looks as though East St.

Louis will go to six cents. Production on this side will have to be curtailed unless the situation in Europe improves. The local market is quiet at 9 to 9¼ cents per pound.

ANTIMONY.—Offerings from China are still fairly plentiful but the lower price has not induced much response, and until demand improves there is not likely to be much advance. The spot situation

is not affected to the same extent, as prices have not followed the full decline on export from China. The local market is quiet at 9 cents for high-grade English and 8¼ cents for Chinese.

ALUMINUM.—The situation is unchanged in this metal, a quiet tone continuing to prevail in the local market where the price remains at 24 cents per pound.

Toronto Markets

TORONTO, June 13.—The past two weeks have seen fewer changes in prices than have occurred for some months past, declines occurring only in heavy melting scrap steel and No. 1 composition.

Advances have taken place in some lines of scrap metals, including malleable scrap rails, No. 1 cast, stove plate, heavy and light copper, red brass turnings, and tea lead.

Boiler tube prices have been adjusted, some sizes advancing while others declined.

Local dealers feel that business has not been what it should have been during the past two weeks, and blame the late season for any dullness that has occurred.

The discount on conductor pipe elbows, outlets, tubes, strainers, cut offs and conductor hooks has been changed from 65 and 5 per cent. off list to 50 and 10 per cent. discount.

Some centres report that collections have been slightly improved of late.

SEVERAL CHANGES ARE MADE IN PRICES OF SCRAP METALS

Toronto.

Heavy melting steel declines from \$17 to \$16, and No. 1 composition, from \$11.50 to \$10.75.

Advances have been made as follows: Mal. scrap, \$15 to \$17; rail scrap, \$14.50 to \$16; No. 1 cast, \$20 to \$21; stove plate, \$15 to \$18; heavy copper, \$13 to \$14; light copper, \$10 to \$10.50; red brass turnings, \$8.50 to \$10, and tea lead, 3¼ to 4c. See list of present prices as follows:

Mueller Automatic Hot Water Heating System

The **MUELLER** Automatic System of Hot Water Heating, consisting of a **MUELLER** Water Reducing Valve, Relief Valve, Water Strainer, etc., combined with a Damper Control has met an urgent demand for a pressure system, free from danger. It is compact, easily installed, dependable in operation and makes the simplest, most effective and satisfactory system on the market today.

The "Mueller System" has these important advantages: (1) Quickly installed on either new or old systems; (2) Water always fresh; (3) Rapid circulation; (4) Entirely automatic; (5) Requires less fuel; (6) No expansion tank; (7) Perfectly safe; (8) Absolutely dependable.

Write for special booklet on this subject. Prices on request.

H. MUELLER MFG. CO., LIMITED, SARNIA, ONT.

Water, Plumbing and Gas Brass Goods and Tools.

American Factory at Decatur, Ill., U. S. A.

Branches, New York and San Francisco

Mueller Metals Co., Pt. Huron, Mich., Makers of "Red Tip" Brass Rod; Brass and Copper Tubing; Forgings and Castings in Brass, Bronze and Aluminum; also Screw Machined Products.

BOILER TIN PLATES HAVE FAIR SALE

Toronto.

CEMENT PRICES ARE NOT CHANGED

Toronto.

Portland cement has been selling in good quantities recently, building operations being largely responsible for this movement of goods. Prices have not changed on cement.

CEMENT—

Car lots, per barrel 3 45
Less car lots, per barrel, f.o.b. yard. 4 35
Per barrel, delivered 4 55
Single bags, 1.15 each, 4 bags to barrel.
Extra charge of \$1.50 per load on less than 24 bag lots.
Rebate of 20c. each for empty bags.

Winnipeg, Man.

WINNIPEG, June 13.—Few price changes are recorded on the local market on plumbing and steamfitting lines. Backward weather has had a depressing effect upon business as it has delayed the season, but with warmer weather an improvement is expected by the trade. Elbows, stove and tapering pipes are ruling steady. Range boilers, iron pipe, conductors and eavestroughs maintain a firm tone. Higher quotations are in effect on soil pipe and soil pipe fittings. No change is recorded on compression goods.

STOVE PIPE AND ELBOWS RULING STEADY

Winnipeg.

A good demand is recorded for stove pipes, tapering pipes and elbows and the following quotations are in effect:

STOVE PIPE—

Per 100 lengths	
Size 6 in. Standard, plain, nestable	16 63
Size 7 in. Standard, plain, nestable	17 96
Size 6 in. Ready to Rivet, nestable	15 09
Size 7 in. Ready to Rivet, nestable	16 42
Size 6 in. Riveted	15 60
Size 7 in. Riveted	16 90

Per doz.	
Size 5x6 in. Tapering Pipe	2 52
Size 5x7 in. Tapering Pipe	2 82
Size 6x7 in. Tapering Pipe	2 82
Size 7x6 in. Tapering Pipe	2 82
Size 6 in. T Pipes	4 27
Size 7 in. T Pipes	4 66
Size 6 in. Heavy elbows	2 71
Size 7 in. Heavy Elbows	3 09
Size 6 in. Light elbows	1 96
Size 7 in. Light Elbows	2 26

NO CHANGE IN QUOTATIONS ON COMPRESSION GOODS

Winnipeg.

Trading is reported fairly steady on the local market for compression goods. Quotations remain steady with no indication of any revision in quotations on these lines.

CLOSET COMBINATIONS IN QUIET DEMAND

Winnipeg

There is no price changes noted on closet combinations. The demand for these lines is quiet at the present time but an improvement is expected as the season advances.

SOIL PIPE AND FITTINGS MOVE UPWARD

Winnipeg.

Higher prices are in effect on cast iron soil and soil pipe fittings. Cast iron soil pipe of two and three inch is quoted at list price less five per cent. Four inch at twelve and a half per cent., five and six inch at less five per cent. and eight inch plus fifteen per cent. Two and three inch cast iron soil pipe fittings are quoted at list price less thirty per cent., four, five and six inch are quoted at the same discount, while eight inch is list price plus fifteen per cent.

FIRM TONE PREVAILS ON IRON PIPE

Winnipeg.

A firm tone prevails on wrought iron pipe and no price changes are recorded since the recent advance.

Your Opportunity

A few years ago the automobile was only an idea in a man's brain.

Then, one day the world saw and accepted its wonderful possibilities and a great new industry that has revolutionized transportation was born.

The idea of automatic home hot water service is just now being accepted.

Its struggle for recognition is over—the foundation for its success has been completed.

Dozens—hundreds—perhaps thousands of homes in your district are ready and waiting for the wonderful service made possible by RUUD Automatic Gas Water Heaters.

The same opportunity that was extended the automobile dealer a few years ago is now knocking at the door of every merchant plumber.

RUUD offers you the only complete All-Quality Line of Automatic Gas Water Heaters and a program of help and co-operation that is on a par with the quality of the product.

**Resolve now to spread the gospel of RUUD
Automatic Hot Water Service — it pays.
Write for particulars.**

474 Bathurst St.

Toronto, Ontario

CONDUCTORS AND EAVESTROUGH CONTINUE FIRM

Winnipeg.

Seasonable activity in eavestrough and conductors is reported with renewal of building activities. The market is firm and prices are well maintained.

RANGE BOILERS ARE FIRM AND UNCHANGED

Winnipeg.

There is no change in the price of galvanized range boilers on the local market. Since the recent advance prices are well maintained.

SELLING THE FARMER CITY CONVENIENCES

(Continued from page 30)

cost is unusually high. At the same time I do not for one moment wish to show that a farmer ought not to own a car, I honestly think he should. But, I do believe, however, that of the two investments, city conveniences or auto, the former would by far be the most profitable. As a matter of fact, I rather think that as a farmer and his folk are on their feet most of the day, the rest, and bracing wind experienced while taking a car ride would be refreshing and very beneficial.

Yet at the same time, a thousand dollars invested in a plumbing and heating system is a greater and more profitable asset than an automobile could possibly be.

Dollar and Cent Investment

When a farmer invests a thousand dollars in city conveniences in his home, he is only losing the interest about 3 per cent., he would get from a bank, or \$30.00 a year, and I do not think that if farmers were shown how much more necessary it is to have plumbing and heating systems installed in their houses, than either owning a car or having their money invested in a bank at 3 per cent., they would all have bathroom and furnace in preference.

When a farmer deposits his money in the bank, he only gets 3 per cent., and if he wants to borrow money from a bank he must pay 7 or 8 per cent. But if he were to invest his money in his house in the shape of city comforts and wanted to borrow money from the bank, his house would be better security so equipped than having a car. He can in fact, make his home his bank, where he lives one-half of his life, he and his family could have comfort on tap 24 hours a day. His wife would be proud of her home. His family would be brought up to love their home, all at a cost of about 3 per cent. on, say—a thousand dollars. As a matter of fact, there's more real happiness in a farmer's home where the wife is proud of her kitchen, her bathroom and her laundry, than there is in a city home, because the farmer has free fresh air, no noisy, dusty streets, fresh milk from

the cows and eggs from the chicks, all plus city conveniences.

How the Farmer Can Pay for City Conveniences

It is all very well to suggest that a farmer spend money on modern bathroom and kitchen, and so on. But what about the payments? When a farmer buys an auto, he pays about one third of the total purchase price and then some Guarantee Company finances the farmer's notes spread over a period of from 10 months to one year.

The plumbing supply houses, and those who install city conveniences, are not in a position to handle business in that way—first, because after a certain period the plumbing fixtures are not recoverable if payments are not made, and secondly, because wages for making installations form a large part of the cost, cash has to be paid. However, the writer has learned of a better way.

Ontario Govt. Will Provide Cash

The writer called upon members of the Ontario Government recently, and took this question up regarding financing the farmer so as to enable him to have plumbing installed in his home, and found that provided certain conditions are carried out, there is every possibility of a farmer receiving financial assistance from the Agricultural Development

Board, Number 5, Queen's Park, Toronto. This is a provincial Department operating under the Agricultural Development Act, 1921. Full information can be procured by dropping a line to above address.

Greater Efficiency on a Farm

There's more efficiency in that farmer's household where every convenience is at hand than in the "tin dish kitchen and the stove-heated house."

A farmer living in a fully-equipped house will be healthier, wealthier and wiser. He will be able to do more work, be a clearer thinker, and, in general, be a better citizen.

So it's up to you, Mr. Manufacturer—Jobber—or Sanitary Heating Contractor, to become enthused in this big work by doing all in your power to fit up every farm and rural home with sanitary plumbing and heating equipment. You will profit by so doing, Canada will profit by having the rural depopulation problem solved.

For, after all, the prosperity of the farmer is the true success upon which nations are built.

Use some of the arguments contained in this article when you call on a farmer, and see that his wife is present when you are talking to him.

New Goods of Interest to the Plumbing Trade

New Adjustable Wrench

The Keystone Manufacturing Co. of Buffalo, N. Y., have placed on the market a new adjustable "Keyco" pipe wrench. This tool is said to be a No Slip, Sure Grip pipe wrench, which can be used in all places where the ordinary line of pipe wrenches can be used. The accompanying cut gives a clear idea of the general appearance of the new wrench.

This tool can be operated with one hand and does not have to be "held on" the pipe or stud, and the more tension put on, the tighter becomes the grip of

PATENT APPLIED FOR

the jaws. It is made in two sizes No. 93, length 7 inches, capacity 0 to 1½ in., suitable for ½ in. to ½ in. pipe, and No. 94, length 9 inches, capacity 0 to 2 in., suitable for ½ in. to 1 in. pipe. This tool is designed for use in the car, home, garage, factory or in general, for all kinds of gas and water pipe fittings.

It is claimed that this wrench is very simple in construction, light, well balanced, and strong, with all the major parts made of special alloy steel, oil-hardened, and that it is fully guaranteed by the manufacturers.

Another feature is that the handle part of the "L" shaped half of the wrench is tapered down and ends with a screwdriver point.

New Extension Bit

The Millers Falls Company, makers of tools, of Millers Falls, Massachusetts, have placed on the market a new extension bit. This article is listed in their catalog as number 35 Improved Bit Extension.

It is made in the following lengths: 12 in., 15 in., 18 in., 21 in., 24 in., and 30 in. and is packed one in a pasteboard box.

We are informed that this tool will follow a bit 11/16 in. or larger, but is not recommended for bits larger than 12-16 in. It is said that this bit having

but two jaws, it allows extra wide surface to withstand twisting strain and that the print in jaws conforms to shape of auger bit shank, which allows of perfect alignment, and no wobbling. The jaws are said to be removable and can quickly be replaced and the adjusting nut is heavily knurled which gives positive grip. It is threaded for rapid adjustment, with the upper portion of the adjusting nut of hexagon stock to permit of tightening with a wrench.

No. 4032

KEY GOODS

Solid substantial Ground Key Stop Cocks — *Deep Barrels* with ample bearing surface — Heavy Hex. *Keys finely ground in*—Each piece tested to 200 pounds.

When a job is put up with these Stops *it will stay up*—no tearing down again because of bad threads or leaky Keys.

How To Do It!

When putting up fixtures in lath and plaster, or hollow tile, follow these directions and you will have no difficulty in making attachments.

Take the Rawlplug tool and carefully make a hole in the plaster, select a long Rawlplug and split the end with your knife about $\frac{1}{2}$ inch, insert it in the hole, bending back your split portions as shown in the illustration; turn the screw home and then cut away the split portions. **This method positively prevents the plug from falling into the hollow behind!**

The Rawlplug way is the **BETTER WAY** to securely attach fixtures to any material—For satisfaction, economy and permanent work always use them. A postcard will bring you samples and price list.

THE Royal

Automatic Gas Water Heater

Twelve Reasons Why The ROYAL is Best

- 1—Low Price.
- 2—Easy to Install.
- 3—Uses very little Gas.
- 4—No Pilot Light Waste.
- 5—Eliminates Repair Bills.
- 6—Lime and Sediment Proof.
- 7—Pure Wholesome Hot Water.
- 8—Instant delivery at Faucet.
- 9—Full pressure at all Faucets.
- 10—Delivers water at 130 degrees F.
- 11—Operates with furnace coils in winter.
- 12—Connects to Return Circulation without aid of separate tank.

Sold only by or through Plumbers.

Are These The Opportunities You're Looking For?

Fan Heating and Ventilating Engineering is the pinnacle of all other forms of heating, and of all branches of steam fitting and sheet metal work. It prepares you for:

1. For Employers it enlarges their business opportunities 100%.
2. Employees it raises to Foremanship of a large shop.
3. Or as Designing Engineer of some large Heating Contractor.
4. As an intelligent Salesman of Heating Appliances.
5. As Chief Engineer with a Heating or Furnace Manufacturing Co.
6. Later a Consulting Engineer to Architects and Building Contractors, etc.

Which of These Are You Working for?

Full Information Free.

A Suggestion

"Medium Weight soil pipe has a round bead pattern at the hub to distinguish it readily from the Extra Heavy weight pipe which has a flat bead pattern."

This is only a matter of design, one being as strong as the other.

We respectfully suggest the advisability of continuing the excellent practice of invariably specifying medium weight pipe in the round bead pattern."

**TORONTO HARDWARE MFG.,
CO., LIMITED**

PNEUMATIC WATER SUPPLY SYSTEM

Gives country residents all the advantages of a city water system without the excessive cost

The wide-awake dealer will make big profits out of this system among customers who now have difficulty with their water supply. It is so simple to operate and costs practically nothing for upkeep.

The outfit consists of an air-tight steel tank which can be placed in the basement, and a "Myers" famous guaranteed pump (hand or power), suitable for pumping air or water, together with pipes and fittings.

Any plumber or gas fitter can easily install it. Every outfit guaranteed to do the work for which it is designed. For small or large dwellings.

Write us for Water System Catalogue and prices. Now is the time to interest your customers

An Explanation

Some Whys and Wherefores

If we seem sometimes, in these advertisements, to stress the mechanical perfection of Vitros more than their outward beauty it is because we can by pictures give you a faint idea of their splendid lines and finish, while to show by a picture that the mechanical parts work smoothly is impossible.

All the care that can be expended on a tank is given to Vitros in their manufacture. They are our hobby as well as our work; our pride as well as our living.

When a plumber installs a Vitro all he has to do is to connect it to the bowl and to the water line. All the testing and worrying has been done by us at the factory before it comes to his hands.

This is one of the reasons why Vitro leads in sales every other tank on the market.

Install Kitcheners Faucets

A quick-opening packless faucet for kitchen and laundry sinks.

The desirable feature of this faucet is the lack of splashing and its ease of operation. A half turn of the lever gives a solid steady stream.

Being packless, the Kitcheners Faucet gives no trouble with leaking around the stem, even after years of use.

The Kitcheners Packless Faucet is made of the best red metal, and can be supplied with a white porcelain or nickel plated brass handle, making a handsome fixture to be used in any installation.

It is worthy of the name Empire and has won its place among Empire plumbing fixtures. It is backed by the Empire guarantee and is recommended for all installations where a quick opening faucet giving a splashless stream is desired.

Empire products are handled by the leading jobbers from coast to coast. If your jobber cannot supply you write us.

Stop Guessing at Prices

The very foundation of your business is based upon you receiving a proper price for your goods and services. Procuring a large volume of business—getting jobs away from your competitor at a cheaper price—keeping a staff of men busy mean nothing unless every day's activities produce a **NET PROFIT**.

Prices are Changing

Hardly a day passes without a number of articles change in price and it is impossible for you to keep an up-to-date price list. If your prices are too high you lose business, and if they are too low you run the risk of losing money. There is a happy medium and you should have at your finger tips at all times the correct retail selling prices on over 3,000 items.

Use Henderson's Pricing System

The Henderson Business Service Limited make a specialty of watching the markets and keeping Sanitary Engineers informed from day to day as to what prices they should charge.

This service will absolutely guarantee you a reasonable profit on every article leaving your establishment. It will save many hours of your valuable time and help at the same time to gain the confidence of your customers. Hundreds of dealers throughout the country have been using this service for years and would feel lost without it. All this is possible for about 10 cents per day.

“Made in Canada”

Your Most Profitable Job

The Anthes Syphon is the Heart of the Disposal System

The installation of a sewage disposal system in a farm house is not only profitable in itself, but it, inevitably, marks the beginning of much worth while future business.

The sale of bath tubs, lavatories, closets, sinks—and the job of installing them and connecting them up—invariably follows.

A Water supply system is necessary to the proper functioning of this equipment and here you make another sale.

Our persistent propaganda in the rural field has opened to you wide sales opportunities. Go out after this worth while business. The sale of a disposal system will prove to be the most profitable of jobs.

The Installation of Griffith's Sanitary Systems Is Your Greatest Contribution to Rural Development

The Canadian plumber has it in his hands to contribute more to the health and well-being of people in the rural districts than any class of citizen.

Every time he persuades a farmer to install a modern GRIFFITH disposal system to take the place of a smelly, fly-ridden outhouse he adds considerably to the general well-being of the country.

Every time he installs a Dayton water system to supersede the back-breaking pump he makes for better health, better citizenship and greater comfort.

AND—best of all—this making of better homes and healthier citizens is profitable business; it puts money in the bank—for you.

Go after this business.

Five Trucks Are Kept Busy on Profitable Jobbing Work

Well Fitted Showroom a Valuable Supplement to Other Sales Effort—Thousand Letters to Prospects Brought Direct Results—Jobbing Trucks Pick Up New and Renewal Plumbing and Heating Business

THAT a showroom can be made a very useful part of the selling effort of a sanitary and heating business even though the business consists very largely of jobbing work, is the opinion of Clarence Paddon of Paddon Co., Ltd., sanitary and heating engineers, of Windsor, Ont., as expressed to *Sanitary Engineer*. This company has occupied the splendid showroom as illustrated in this article for about one year, just long enough to prove that the facilities it offers for showing the various equipment as it will look installed, and for allowing prospects to make comparisons between various equipment, is extremely valuable. During that year the firm has had tangible evidence on numerous occasions of the value of such a showroom.

As will be noted by an examination of the room as illustrated, it is on a floor on a level with the sidewalk. It is shallow but extends across the width of the premises. On the left is shown a modern showcase containing a sparkling exhibit of various bathroom accessories. Other specialty lines, parts, etc., are to be seen displayed on the top of the showcase and on the shelving at the rear. Cross sections of water closets and other equipment showing the interior working allow the salesmen to demonstrate more clearly to customers the value of certain equipment and the advantage of buying standard, highclass wares. In the centre of this display room is a small stairway leading to the raised floor level on which the office and other rooms are located.

Can Make Comparison

In the showroom to the right of the stairway is to be found road array of plumbing and heating equipment. Pedestal basins, wall basins, kitchen sinks, drain boards, toilets, gas and electric water heaters, closet seats, etc., are arranged in attractive form. Prices are prominently shown on all equipment, and the merchandising element introduced by this means is said to be well worth while. Electric washing machines and wringers are shown, as much for their influence on the sale of water heating equipment as anything.

For purposes of comparison three different types of gas water heaters are shown connected up, prices plainly shown on each. The same applies to electric heaters. The price of sink, drain board, pedestal basin, laundry tubs, water heater and laundry stove complete, etc., is plainly shown.

"The showroom enables us to show the prospect what the equipment will look like when installed and is a much more effective way of selling it than to try to show it from catalog. It also enables the customer to make comparisons, and few of

them will invest the money necessary for plumbing and heating equipment without making some comparisons to be sure they are getting good value," said Mr. Paddon, pointing out that the showroom is not used so much for the purpose of bringing prospects in off the street to interest them in these lines as to bring their own prospects to the showroom to give them a good idea of what they can expect. Mr. Paddon believes a showroom used for this purpose can be made an integral part of the business, but he is of the opinion that it takes more than the mere showing of these lines to interest prospects, therefore the showroom could hardly be looked upon the same as a retail store and made to sell a quota of equipment sufficient to pay upkeep expenses. The Paddon showroom is for this reason not located on a busy thoroughfare, but yet it is sufficiently central to be convenient to prospects.

"We Fix It"

"We Fix It" is the slogan used by the firm. It appears on the windows of the showroom, on the literature and on the trucks. Its use has been found valuable.

A big feature of the business done by this firm has been the jobbing work. A specialty has been made of such work by the employment of five trucks. Service is given on emergency calls by these trucks at any hour of the day or evening. A large volume of such business is done and with the special facilities employed it is made to pay a good margin of profit. Each truck is completely fitted up to handle all such work and they are on the go pretty well all the time. Much of such business comes in over the telephone. It has been found that the lower charges which can be made on such work by speeding up the volume is much appreciated by customers who formerly hesitated to pay for a couple of hours time of a plumber installing a washer or doing some other such small job.

A close watch is kept for prospects by the employees of the firm, but premise report cards are not used. Mr. Paddon stated that they found too much time was being taken up by the men on various jobs, they making the excuse that they were looking around for prospective business in buildings in which they were working. At \$1.25 an hour customers soon commenced to complain about having to pay for time consumed in such investigations, and if the customer were not charged the firm could hardly afford to stand the expense merely on the odd chance of getting some business from such reports. Mr. Paddon finds his firm enjoys more confidence

of its clients by having workmen go about their business in workmanlike fashion and not waste time.

Charging of Material

Questioned concerning the practice of charging for material and time on various jobs Mr. Paddon explained that whereas formerly a charge was made for all material which went out and a credit allowed on material returned, a straight charge for material actually used and time was now made. It was found under the other plan that any material lost or mislaid was being charged against the customer and some heated complaints made of this plan brought about the change. Obviously a firm could be much misunderstood by following such a plan.

Considerable business is done by this firm in new and renewal installations of heating equipment and recently a large number of installations of pipeless furnaces have been made. Contrasted with the development of plumbing business in new house construction, Mr. Paddon points out that heating installations can be done much more profitably, in view of the ridiculously low tendering done by certain plumbers on speculative construction work where contractors are anxious to jump at the lowest possible cost.

Furnace Work

A large section of the floor space in the shop is devoted to furnace work, complete furnaces, parts and other heating equipment being kept in orderly array. In order to develop new business Mr. Paddon advertises the pipeless furnaces very widely and canvasses builders and owners. He follows the building permits closely and in view of the fact that heating equipment is not installed until the buildings are fairly well under way, this plan gives him plenty of time to work up the prospects before the business is actually placed. He finds that pipeless furnaces have been very successful for various kinds of installations, particularly the compact style of bungalow home now so popular where the absence of long halls and distant rooms removes much of the former difficulty in using this type of furnace.

"We sell a large proportion of those whom we canvas in this manner and have had quite a number of installations this year to date," said Mr. Paddon. This means something, too, because there has been considerable building done in Windsor and district this year to date and real estate is selling rapidly to builders who are contemplating further construction.

Another plan which has done much to stimulate business and supplement the advertising effort has been the sending out of special literature to prospects. Mr. Paddon selected from the directory a list of one thousand names comprising builders and home owners whom he knew would be interested in heating and plumbing equipment. This literature dealt with the advantages of pipeless furnaces and modern sanitary equip-

ment. Many direct results were secured, bringing business in both new and renewal equipment.

Keeps Running Steadily

"Between the use of such letters and the consistent advertising campaign we keep running in local papers, our firm secure enough business to keep our plant running steadily," said Mr. Paddon. The emergency trucks continually running around town bearing prominently the firm name and the slogan "We fix it," were also said to be a standing advertisement of service and efficiency which brought many enquiries. While report cards were not used, it was found that many people took advantage of the presence of a plumber in the house to ask his opinion about certain plumbing or heating equipment and in this way it

was found the trucks used for small jobbing work frequently secured jobs involving extensive plumbing and heating installations in both city and country homes.

"Frequently we get a job installing a whole new bathroom or heating equipment, or installing a second bathroom or laundry tubs in old houses, from the connections established by this jobbing work," said Mr. Paddon. A summer resort district in close proximity also offers a good field for spring, many persons realizing that summer holidays can be made much more enjoyable if modern sanitary conveniences are available.

The tinsmithing shop is behind the office, and at the rear is a big shop for furnace and plumbing work. Here the most modern cutters and threaders, etc., are to be found.

Fifty Years a Plumber—Has Done Much for Sanitation in the Maritimes

FOR fifty years continuously connected with the plumbing business, is the proud achievement and unusual distinction of Richard Walsh, plumbing and general sanitary inspector of the St. John board of health. Mr. Walsh is a man with a double longevity in service record, for he also served as a volunteer fireman for thirty-five years.

Mr. Walsh has been largely instrumental in placing into execution the program of sanitation adopted by the provincial department of public health as far as the St. John district is concerned. Because of his long and varied experience in plumbing, he was given a free hand and with the result that sanitary conditions in the St. John district, including the city and county of St. John, have been greatly improved.

Mr. Walsh was responsible for the banning emphatically of the privies and the substitution of modern sanitary systems in all dwellings. An energetic campaign resulted in the summary removal of the ill smelling as well as distinctly unsanitary privies. The consequence was that many thousands of modern plumbing systems were installed in the dwellings.

But the work did not cease there. Shower baths and the most up-to-date flush closets and sanitary lavatories were installed in industrial establishments in St. John under the general direction and supervision of Mr. Walsh.

During his service as plumbing inspector, covering about ten years, the master plumbers of St. John have profited as never before. The number of plumbing contractors multiplied until, whereas ten years ago, there were about twenty men engaged in business as plumbing contractors and jobbers, there are now no less than fifty. And, ten years ago, plumbing supplies usually were sold only in the wholesale hardware establishments. Now a dozen plumbing contractors maintain stores for the sale and display of plumbing supplies, including bath tubs, bowls, sinks, shower baths, etc., in connection with their workrooms and offices.

RICHARD WALSH

Showroom occupied by Paddon Co., Ltd., Windsor, Ont., is shown here. It is a shallow room extending across the full width of the premises and enables the showing of all sanitary and heating equipment, specialties, small accessories, etc., very attractively. Prices are plainly shown and various types of equipment shown all connected for purposes of comparison.

Asked concerning his opinion of markets at the present time, Mr. Paddon was of the opinion that it does not pay to lay in large stocks of pipe, sheets, etc. He believes in having adequate stocks to meet requirements, but points out that there is little use trying to speculate on a rising market because of the fact that some competitive plumber will take advantage of any stock he may have to place lower tenders for work, and if by chance the market sags instead, the plumber has to stand a loss on it. He figures the plumber loses either way, unless he is not subject to such stiff competition that he can take advantage of stock on hand on a rising market.

QUICKLY REPAIR DAMAGE FROM TORNADO

The city of Guelph and immediate vicinity suffered heavily in the tornado which did upwards of two million dollars damage in the province on Monday, June 25. During the twenty-five minutes that it took the storm to sweep through Guelph, \$250 000 damage was caused, and three people were killed within a radius of ten miles. The large plant of the Ontario Malleable Iron Co. was in the direct path of the storm, and a large section of the roof of the foundry was blown in. Fortunately the men had quit work for the day or a serious loss of life must almost certainly have occurred.

With characteristic energy the company had a contractor on the job immediately, and a gang of sixty men working

day and night soon accomplished wonders in clearing things up and rebuilding the damaged buildings.

When a representative of Sanitary Engineer visited the plant, just three days after the storm, practically the full staff of moulders was at work in the foundry, just as though nothing had happened. Officers of the Ontario Malleable Iron Co. assured our representative that their output would not be interfered with to any appreciable extent, and orders would be shipped about as usual.

BOOKLET ON SANITATION

The federal department of health has just issued a brochure on Sanitation, dealing with the subject of sewage treatment for isolated houses and small institutions where municipal sewage system is not available. The urge for such information has been so insistent and, having in mind the health and welfare of the people, it was considered advisable to have the subject dealt with in a scientific and thoroughly practical manner. The publication is generously illustrated,

emphasizing the application of the advice given. Homesteaders, summer cottagers and trustees of small institutions are strongly advised to avail themselves of the information contained in this publication, which can be obtained free on request from the Deputy Minister, Department of Health, Ottawa.

STAMFORD WATER PURE

Niagara Falls, Ont.—An official of the Provincial Board of Health has been in the township making an analysis and investigation of the Stamford water supply, and reports that it is beyond reproach. The pipes, however, have become impregnated with contaminated matter and a chlorinating plant has been installed.

BRITISH TINPLATE INDUSTRY

The success of the British tin plate industry has been manifested in the past year by the fact that the British plants, owing to lower labor and operating costs, have been able to bid more for Bolivian tin concentrates than the mills of the United States have been able to offer.

WILL INSTALL FILTRATION

Oakville.—Acting on the suggestion of the Provincial Board of Health and the recommendation of the local board, the town council has instructed the Water and Light Committee to call for estimates on the installation of a filtration plant.

"IT IS A DANDY"

"We are very much pleased with Sanitary Engineer in all departments. It is a dandy."

W. C. Hibbert, Carman, Man.

Septic Tank Layout for a House Occupied by Ten Persons

Plumber is Not Sure on a Few Points in Connection With Such an Installation—Size of Tank Determined by Number of People in House and Allowance of Gallons of Water Per Person Each Day

EDITOR, Sanitary Engineer:—Will you please publish information regarding a septic tank to take care of sewage from a house to be occupied by 10 persons? I am asked to install one and am not quite sure about a few points. Could I use 3 inch, 4 inch, 5 inch or 6 inch tile or is 4 inch the only suitable size to use? How many four inch tile would I need for a tank of the size necessary for 10 persons? Does the tile pipe have to be laid below the frost line, where we have real cold winters? H. S. McMurray, Chesterville, Ont.

Answer—The accompanying illustrations are plan and elevation, complete with all the necessary sizes for a septic tank suitable for a building occupied by 10 persons. The size of a septic tank is determined by the number of persons occupying the building and the allowance of gallons of water per person per day.

The septic tank portion, known as the dosing chamber is first considered by the amount of sewage to be discharged per day, and, in the sizes given an allowance of 27 gallons is made, per person per day.

Now, it will be noted that the amount

of sewage to be discharged is 270 gallons each time the syphon operates, and, the rate of discharge from a 3 inch syphon is between 80 and 90 gallons per minute. This being so, sufficient field tile must be provided. One foot of 4 inch field pipe will hold one half gallon of fluid, therefore it would be necessary to lay 540 lineal feet of field tile in the disposal bed. These should be laid level and open at the joints about one quarter of one inch. Broken stone, coarse gravel or coarse railway cinders ought to be laid over the joints, but such material is not easily available. A covering over the whole system of field tile is very desirable.

It is advisable to use 4 inch field tile pipe for several reasons, chief of which is, that the ground will absorb such a quantity as is easily distributed through such a size. And, by laying such open jointed tile pipe not closer than from 3 to 4 feet, the ground is kept in a suitable condition.

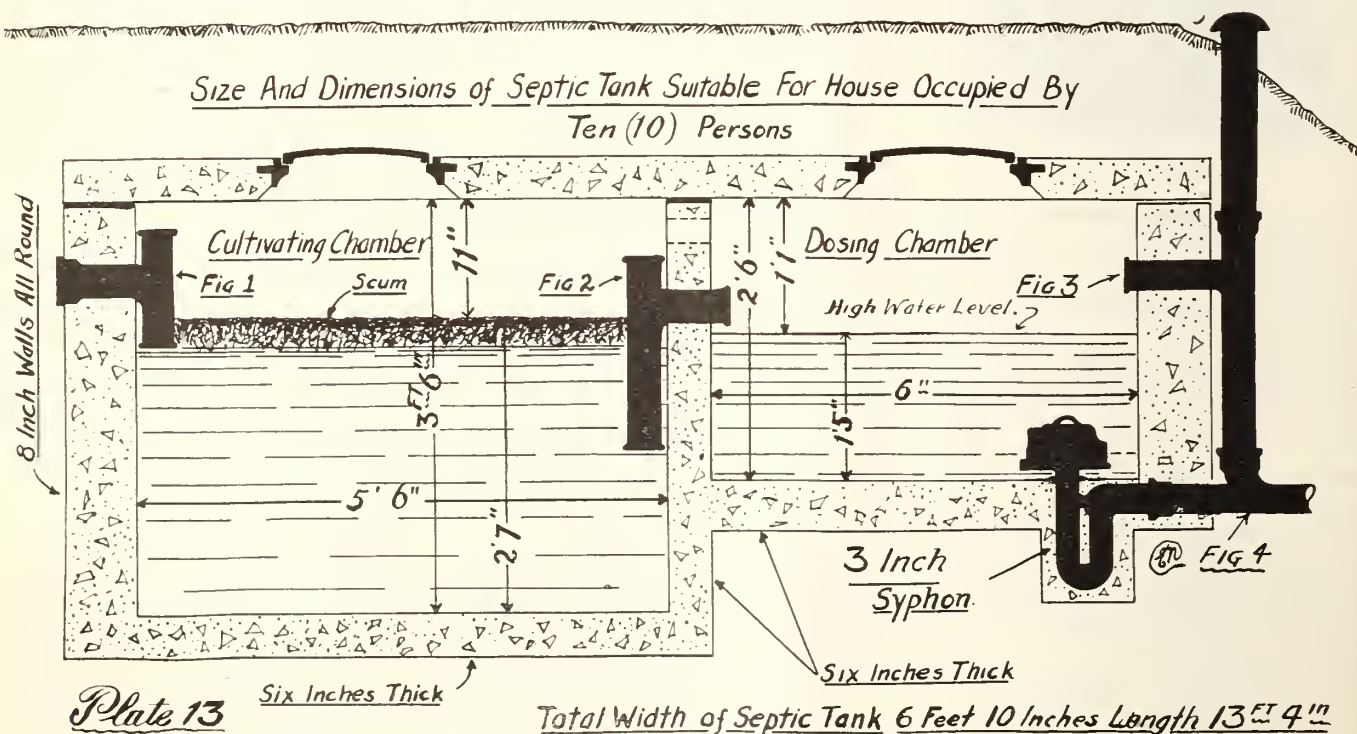

Another reason which is a good one is that the outlet of a standard 3 inch syphon has a 4 inch discharge outlet, and as the main trunk line of piping and branches too are 4 inches in diameter

the force of discharge removes any sluggish flowing matter from the pipes and in a way assists to keep the pores of the ground open.

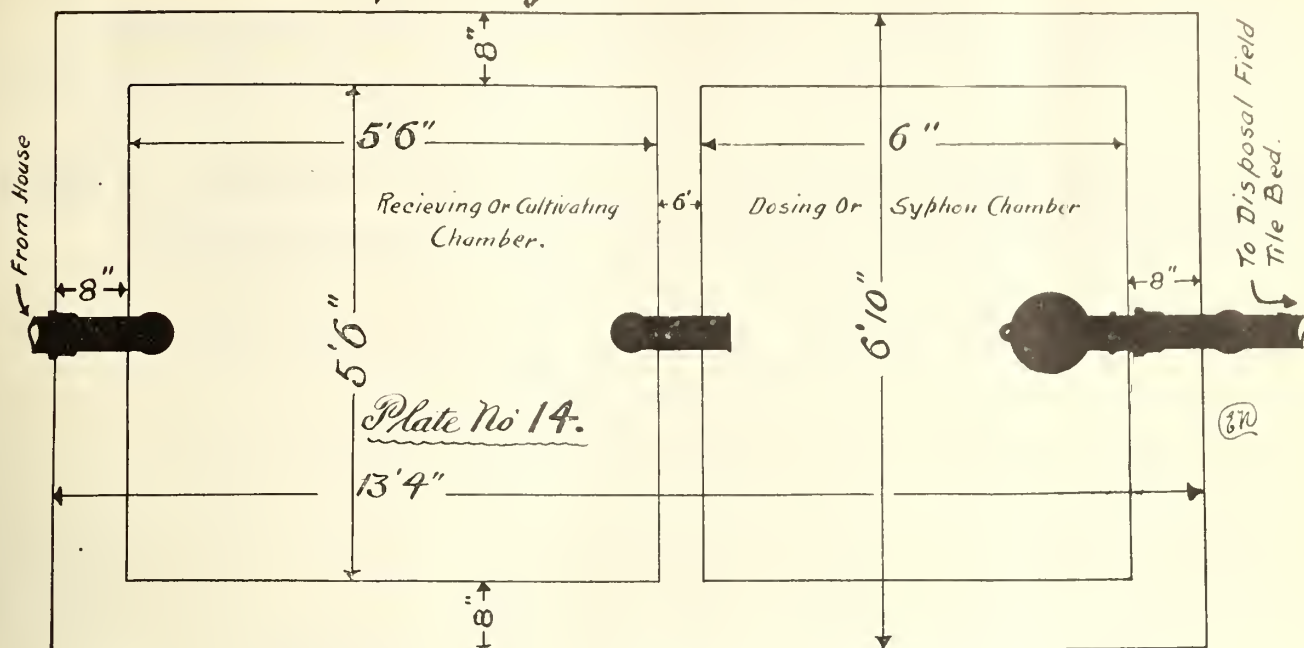

If larger pipes were installed and the same size of syphon used, the force or pressure so necessary, would be non-effective. If a smaller size of field tile pipe were used, a back pressure would, in the form of resistance, interfere with the easy discharging of the syphon.

The question of freezing need not be considered because the bacteria in the effluent from the dosing chamber is of such a nature that will not permit of freezing provided that the pipes are not laid too low.

It would appear to be almost a contradiction to make, but it is nevertheless true, that if a system of disposal field tile is laid about 18 inches to two feet below the surface of the ground they or their contents will not freeze. But on the other hand if laid too low they will freeze, for the following reason: The bacteria on or near the surface of the ground in co-operation with the bacteria in the sewage discharge are always very active. There are few of the necessary bacteria in the ground below 24 inches.

Plan With Size Of Septic Tank Suitable For House Occupied By Ten (10) Persons.

That is why the pipes do freeze when laid too low.

Some time ago one of our readers being somewhat skeptical of this statement decided he would take no chances, and he laid the pipes below the frost line and the pipes froze solid. Why? Because if anything will draw frost it is water, and, seeing that no bacteria

(or very few) are present in ground at a depth of several feet, the bacteria in the effluent died and of course the moisture of fluid without life just simply froze solid. If the information given herewith is followed out, both in the description and in the illustrations, there is very little likelihood of experiencing any trouble.

Technical Editor.

office. A separate permit must be obtained for digging a trench for sewer or water pipes.

Considerable discussion centered around the clause calling for an annual inspection of the plumbing in all buildings, except dwelling houses, and of dwelling houses, upon change of tenants. The owner of the house must make such improvements in the plumbing as to make it conform with all the provisions of the plumbing bylaw. It was finally passed.

Plumbers Must Pass Examiners' Tests

New Regulations Call for Establishment of Licensing System in Regina—Establish Reciprocity

REGINA, Sask.—The establishment of a board of examiners and a licensing system for plumbers was tentatively agreed to by the city council, despite opposition from J. A. Birt-whistle, sanitary inspector for the city.

A large delegation of city plumbers attended the special meeting held to consider the plumbing bylaw with 11 clauses. Most of the clauses were given a second reading, and the remainder will be taken up at the next council meeting.

Under the new regulations, a license will have to be secured within thirty days of the passage of the bylaw by any person wishing to work at the plumbing trade in this city. Application for such a license will be made to a board of examiners, consisting of the plumbing inspector of the city of Regina, and two practical plumbers, a journeyman and a master plumber, appointed by the medical health officer, and one member appointed by the city council.

The \$100 annual fee for master plumbers was a matter on which there was not general agreement. The bylaw

also provides a fee of \$2 for journeymen plumbers for the first year and \$1 for succeeding years.

It was agreed to approach Saskatoon, Moose Jaw and other cities where a similar bylaw is in force, with a view to establishing reciprocity between Saskatchewan cities.

Several clauses of the new bylaw mark a new departure from previous regulations. Application for permission to do any piece of plumbing must be made to the office of the medical health officer, and where considered necessary, a plan of the work must be filed with the same

FIND UNSANITARY SCHOOLS IN HAMILTON

Hamilton.—Sanitary conditions at the Murray street school are nothing short of deplorable, so a deputation of members of the building committee of the board of education discovered when making a tour of inspection this week.

This and another school have been condemned by the board of health, it was stated, and the action of the health department was easily understood by the trustees after making the inspection. In some parts of the Murray street building the odor from antiquated plumbing equipment was overpowering.

The question will come before the building committee of the board of education. Appropriations will be sought from the council for the reconstruction and improvement of the schools in question.

REPRODUCED "SANITARY ENGINEER" EDITORIAL.

In a recent issue of the *Ottawa Citizen*, prominence was given to a reproduction complete of the editorial appearing in *Sanitary Engineer*, entitled "Saving Fuel Waste."

Metal Worker, Chatham, N.B.—Where can I procure a book called *Country Cornice Worker* and a book on roof work and copper flashing.

Answer.—From the U.P.C. Book Co., Inc., 239 West 39th St., New York, N.Y., U.S.A.

New Heating Furnace Used for Steam, Vapor Water or Warm Air and Ventilation

Can Also Furnish Moistened Air. Newly Patented Furnace Has Novel Features—Claimed to be Real Fuel Saver—Has Combined Humidifier

Written for Sanitary Engineer by EDWIN NEWSOME, Consulting Sanitary and Heating Engineer

ON EVERY hand is heard the cry that the heating of buildings and particularly dwellings appears to be costing too much money. People are building houses that cost upwards of \$15,000.00 and are installing warm air heating furnaces. Not far from the home of the writer, a man built a house costing \$12,000.00 for which the land cost less than \$1,000.00 and a warm air furnace is installed therein. Why? Because of the apparently high cost of hot water, steam or vapour heating.

Of course this does not mean that dollar and cent value is not represented in such systems of heating. To the average heating engineer, it seems a pity to see houses costing such sums as the above mentioned, being heated with warm air furnaces, but what is the solution?

The public demand appears to be for low cost heating systems, and with that in view, inventors all over the world are endeavoring to design furnaces and radiation that can be produced at a lower cost in terms of dollars and cents.

Three years or more ago A. E. Streadwick, Toronto, began to experiment with certain new and novel designs of heating apparatus, and finally he completed what is said to be one of the most flexible types of heating furnaces of the day. It is claimed to be the very essence of simplicity, and one that can be used as a steam furnace, hot water furnace, or warm air, or hot water and warm air.

Separate Units

This furnace can be made up in separate units so that one or more parts of a building can be separately heated. For example if one part of the home is so far away from the furnace that it is almost impossible to secure satisfactory circulation without some other part of the house being robbed of heat, the furnace can be constructed so as to furnish an entirely separate heating member for that part of the house.

Fig. 1 shows how this is done, and it can readily be seen that if more than

two heating circuits are desirable they can be arranged easily, because of the simple square circuit construction.

The principle adapted is very simple and positive, it is merely a number of square coils so arranged tier upon tier with, according to the number of units, the usual flow and return, all of which are separate from each other, making it impossible for one pair of flow and return pipes to rob another. This is a novel idea and one that may find favor with many heating engineers.

No Large Body of Water

Most heating furnaces are so constructed that there is actually no true circulation: the water is very often baffled in some way or other and has to travel in an unnatural way into vertical headers, all of which water motion tends to restrict rather than encourage circulation and also makes it necessary to hold large bodies of water in the furnace.

The most efficient heating unit the

world over is found to be, by actual test, some form of coil. (Note the gas water heaters.) In the city of Hamilton and in many parts of this continent there are houses being heated with three or more ordinary 25 feet copper coil gas water heaters, so that the principle embodied in this new furnace is well established, and by the addition of a steam dome the furnace is readily changed from hot water to steam.

A Combination Heater

This furnace can be used as most other furnaces are, merely as a hot water, steam or vapor furnace, but it can also be adapted as a combination of either the above with warm air.

The outer casing made of transite asbestos is so designed that it operates just in the same way as a warm air heating system, by connecting several warm air outlets to the ordinary base boards or floor warm air registers, and there is not the dust to contend with as is found with the regular warm air furnace.

A Combined Humidifier

Not only are heating engineers convinced that to properly heat a house, some positive method of moistening the warm air is necessary, but the most notable health authorities are viewing with a great deal of alarm the increase in cases in tuberculosis, asthma and other pulmonary victims. This, the inventor has not overlooked in that a water pan is designed as part of the supporting casting, making it actually a part of the furnace and not merely an addition that may be added or eliminated at will of the heating contractor, as is very often done when close tending on a job is a big factor.

Description of Two Units

In Fig. 1, two units are shown, one the lower unit with its own flow and return and the upper or number 2 unit with flow and return, and by perusing the other illustrations, Figs. 2, 3 and 4,

Sketch of the Furnace.

the water travel can be easily traced up from the return to the flow. It can be readily seen that any number of separate units can be provided for the purpose described.

Fig. 1 is a front view of the furnace with the front portion of the casing and the fire door removed. Fig. 2 shows a side view giving grate detail as also does Fig. 3, while Fig. 4 gives the reader an idea of the square coil formation with gas vents, inlet and outlet of water flows.

Novel Grate Construction

Most grates furnished with regular house heating boilers, and not a few boilers for heating large institutions and buildings, are of the simple rocker type. The grate in this furnace is still another departure from the conventional; there are four sections, all operated by one shaker handle, but the movement is very much different. The grates are first elevated, then brought slightly forward, and all are on an inclined plane so that all the ashes or clinkers are gradually brought to the front of the furnace, making it easy to remove such waste, or to dump the furnace.

VANCOUVER PLUMBER WRITES

Sanitary Engineer, Toronto:—

We always look forward to receiving Sanitary Engineer, taking special interest in your replies given in the "Questions and Answers" Department. We always study the technical articles and they are real good.

Wishing your paper all kinds of success,

Walden Bros., Vancouver, B.C.

The furnace used for the three year test contained 35 lineal feet of special tubing with direct and continuous circulation upwards. The heating surface being equal to 19 square feet was fitted to 236 square feet of hot water radiation, and although the regular requirements of radiation should have been 250 square feet, the test showed that by adopting the warm air combination, twenty per cent of radiation could be closed off.

The complete furnace is comprised of

grey iron castings, the base, firing door and ash p.t. door, shaking grates lever and damper and humidifying base with grate supports.

Detail Description of Complete Furnace

The furnace proper is made of one, two or more units of round tubing square coiled and mitered, not threaded; all the miters are electrically fused and no part of the coiled tubing is in any way restricted. Every part is in direct contact with the fuel, no matter what the fuel used may be, soft coal, hard, small or in lumps. Wood, oil or gas fuel can be used equally well, without making any change whatever.

The combustion chambers are made up of a number of transite asbestos baffles, as also is the inner and outer casing.

The inner casing cover can be constructed either of asbestos or grey iron with a number of pyramid pockets, these increase the heating surface considerably in connection with the warm air heating combination.

Cleaning and Inspection

Fifteen minutes is all that is necessary to clean out and inspect the furnace.

FIG-1

FIG-2

Figs. 1 and 2 being cross-section of side and front of furnace.

Fig. 3 gives grate details while Fig. 4 gives an idea of the square coil formation with vents, inlet and outlet of water flows.

this latter is accomplished by moving the panel clean-out door shown in the perspective illustration. The baffles can be removed and the whole operation performed while the furnace is in operation.

TIN SMELTERS IN UNITED STATES TO CLOSE SOON

Two of the five tin smelters of the United States will close on July 1, according to an announcement made in tin circles here recently, and will remain

closed until business improves. The American Smelting & Refining Company's plant at Perth Amboy, New Jersey, is one of the big plants that will close next month.

United States production of tin was an outgrowth of the war. Prior to 1914, Bolivian tin mines sent their product to German and British smelters for treatment, and the United States bought its tin in plate form.

During the war Germany was out of

the market, and Bolivian concentrates went to the United States, where plants were erected or converted for the treatment of these concentrates. Singapore also shipped some tin foundation to the United States, the concentrates passing through this port.

These American smelters have now been forced to close because of their inability to compete with British exports of tin plate.

Another City Where Gas Company and Master Plumbers Co-operate

FOLLOWING out the plan recommended in the last issue of Sanitary Engineer in connection with the relations of gas companies and master plumbers, it is interesting to note the progress made along this line in the case of Tacoma, another United States city where smoother relations now exist between these factions. Here's what the Tacoma Master Plumbers' Association has to say on the subject:

"What the gas company sells is gas. That sounds easy and it doesn't seem to have required any special research, but how many master plumbers know it? Gas stoves, lighting fixtures, water heaters? Certainly gas companies sell them, and on attractive terms, too. But the main idea is not to sell stoves or gas mantles or water heaters. The main idea is to sell gas.

"The master plumber doesn't care about the selling of gas. His business is to sell and install fixtures. The trouble has been that the gas companies in most cities can't tell from the activities of the plumbing trade whether they want to sell and install fixtures or not.

"The Tacoma Master Plumbers' Association, however, decided that the fixtures should be sold by the members, and told the gas company so. They were surprised to find that the company thoroughly agreed. In fact, the gas company was selling its appliances more in self-defense than for any other reason.

"So an agreement was struck off. And so far as the Tacoma plumbers are concerned the agreement is all to the good.

"According to the arrangement the plumbers sell and install the various appliances; and, in order to facilitate and encourage display and merchandising, the plumbing dealers aren't even going to have to pay for the gas used for this purpose.

"There is co-operation with a vengeance.

"And when the gas company sells a stove or anything else through its own rooms, and when the appliance requires piping, the plumber is called in to do the job."

Where to Look for Summer Business

There's Money in dairy farming

But, like anything else worth while, the most profitable way to operate a dairy farm is the right way!

Good, pure bred stock can prove its worth only when given proper care. Just as important as food or stabling, and often neglected, is the water supply!

Carrying pails of water to thirsty cattle is a back-breaking task and an extravagant waste of time and labor.

Running water on the farm means more and richer milk yield, because the water is always fresh and at the right temperature.

Ask us about it. We'll talk facts to you!

Tinsmithing and Sheet Metal Work

Making Pipe Connections That Must be Made in Taper and in an Offset at Same Time

NOW and then the workman finds pipe connections that must be made in a taper and in an offset at the same time. Fittings of this kind are more frequent in furnace work than elsewhere, and so we might ascribe this problem to that field of the work.

First, draw the elevation, making the central line 1'-7-8-8' to the desired angle and rise. Then bisect the miters c-d and a-b. After which describe the half-sections A and B to correspond with the diameter of pipe that must join to these ends. Divide these half-sections in any number of equal spaces and square lines into the miter line as shown. This will give points 1-3-5-7, etc., also points 2-4-6-8, etc. Join these points with the triangular lines, thus giving body to the middle piece and also dividing it into triangles. Be sure to draw your lines so that you will step from one point to another, as from 1 to 2; 2 to 3; 3 to 4; 6 to 7, etc.

To obtain the true length of these lines we must pick them up and set them over into the diagram of true length. So we pick line 2-3 and set on a horizontal

line; from point 3 in this line we erect a line equal to line 3 of section B. Then join 2-3 with a line, and this is a true length. Next pick the elevation line 3-4 and from the last point 3 in horizontal line of diagram, set line and erect a line from this point equal to sectional line 4 of A. Then join 3-4 with a line and you have the true length. After this pick line 4-5 and from 4 in the horizontal line, set off this line and erect one equal to the line 5 of section B, and 4-5 is the true length. Repeat in this way until all lines have been transferred in their relation into diagram as true lengths as shown.

To set out the patterns observe that the end angles set on the middle piece and, therefore, we must first develop the pattern for angles at top and bottom so that we can pick the girth as 2"-4"-6"-8", etc., also 1"-3"-5"-7", etc., that we may use these spaces as girth spaces for developing the middle piece. Observe this saves developing two sections through the miter line, and as we must have the angle anyhow we might as well use those miter cuts for girth spaces. So for

the pattern of the top angle pick the girth from section A and develop the same as any ordinary elbow. In the same way to develop the pattern for the lower angle, pick the girth from section B and set off as 7-7, then project your lines and you will have the pattern.

To start the middle pattern draw any line at 1-2 equal to 1-2 of the elevation. Then pick girth space 1"-3" and 2"-4" from our angle patterns, and using points 1 and 2 as center, strike arcs at 3 and 4. Then pick the true length 2-3 from diagram and using point 2 in pattern as center, cross arcs in point 3. Next, use true length 3-4 and with the new point 3 in pattern as the center, cross arcs in point 4. Next, pick the girth spaces 3"-5", also 4"-6", from angle patterns and using the new points 3 and 4 in pattern as center, strike arcs as at 5 and 6. Then pick the new point 4-5, and using the new point 4 in pattern as center, cross arcs in point 5. After this pick the true length 5-6 from diagram, and using new point 5 in pattern as center, cross arcs as in point 6. Repeat in this way until all points 13

Working Drawing Shows How to Make Pipe Connections in Taper and in an Offset at the Same Time.

and 14 are established. Then draw lines through all points where arcs cross and you have your pattern finished. Owing to the tapering nature of this middle piece, edges for peaning or riveting

should be allowed extra, otherwise in bending the edges our fitting will become a little smaller and our end pieces are liable to telescope into the middle piece.

Patterns for Gable With Scroll Attached

For Buildings Finished in Gable Effect With Short Runs of Horizontal Moulding

SOMETIMES buildings are finished with a gable effect with short runs of horizontal moulding and these finished in a scroll as in the sketch of this drawing.

This will be much the same as the coping ending in a scroll we considered some time ago.

So here we first draw a detail of the moulding to be used, as shown by the shaded section.

Divide this detail so the curves are in equal spaces, number each point and bend, and then project lines both ways.

Draw the pitch line E-D and bisect the angle and establish the miter E-B. After which extend the elevation lines until they meet as center line of gable. This center line can be moved downward to enable convenient development. Space in the shop does not permit making extended spaces between miter cuts, and

so the miters must be crowded together in order to find space to develop them. Then on the other end as at A-F detail the scroll, which acts as a finish to the moulding. Now as the miter B-E is an equal bisection of the 2 angles, the same girth can be used for the gable or the horizontal mould.

So pick the girth from the section and set as in pattern "A" and also in pattern "B." Draw stretchout lines so they are parallel with the run of your elevation and then from each miter line project lines so they will be square to the run of elevation until they intersect stretchout lines of similar number. Join these new intersections with lines and you have the pattern finished. The spiral is already a pattern only in the spiral line a-b a tapering strip as at "M" is planted so as to set out the spiral. Otherwise this all there is the above development.

Laps must be allowed for seaming and riveting the miter joints.

EXPERT RECOMMENDS CENTRAL HEATING

Winnipeg, Man.—"Although I have not had time to make more than a brief survey, I see no reason why I should not assure you that central steam heating should be perfectly feasible and a good business proposition in Winnipeg," said S. G. Neiler, engineering expert of Chicago, addressing the public utilities committee. Mr. Neiler is the expert brought here by the city to investigate conditions as a preliminary to the establishment of a central heating plant.

In a city where heat is needed for so many months of the year, Mr. Neiler said, the plan should be even more satisfactory than in more temperate places. As a general thing, plants of this character had been found to pay well.

Mr. Neiler thought that if the service should be extended to the residential districts, most of the residents probably would be glad to accept it, but he was inclined to recommend that at first it should be confined to a central district.

UNIQUE HEATING FEATURES

Montreal.—The new pathological building of McGill University is to be fitted up with many wonders in the way of modern mechanical equipment.

The building will be heated by a forced hot water system. High pressure steam, supplied by the boiler plant of the Royal Victoria Hospital, is brought to the pathological building in a tunnel connecting the two buildings. By means of this steam, water is heated in hot water converters and is then forced through the piping system to the radiators of the building by motor-driven pumps. There is no automatic temperature regulation in the various rooms but temperature regulating apparatus controls the temperature of water leaving converters.

Building in Canada

FIGURES relative to the building industry, as secured by Sanitary Engineer, indicate that in fifty-six cities throughout Canada building during May was practically the same as in April. Value of building for the month approximated seventeen and one-half million dollars. Of this amount there were 2,500 permits for dwellings and 4,700 permits for garages, stores, factories, etc. All provinces except Quebec and British Columbia indicate a greater anticipated activity in building. In the case of the former there was a considerable decline. The most pronounced increase for the month was in Ontario, where it amounted to 31 per cent. These figures not only give an idea of the amount of building being done this year but they indicate what class of building predominates. Such figures should be helpful to sanitary and heating engineers in planning local measures to stimulate business.

No Need for Alarm

REPORTS of business conditions from the craft in various parts of Canada continue to vary greatly. Much complaint is made in some quarters about continued price cutting and low tendering by plumbers who have not enough knowledge of their business to realize that they are doing such work very often at a loss. But the fact remains that the aggressive plumbing firms which are selling their customers on the basis of guaranteed workmanship, good service and fair prices, are able to maintain a steady rate of work throughout the various seasons.

As long as there is a speculative building boom in progress such as is the case in many cities at present, there will be a tendency among builders to accept lowest bids for plumbing and heating installations irrespective of the class of workmanship, as long as it passes local requirements. This is business, however, and no steps can be taken to legislate such competition out of existence. The point is that such operators are not establishing for themselves a goodwill and permanent reputation of a character such as will bring them increasing business over a period of years, and speculative building of this character cannot continue forever.

Complaints of this nature and others concerning the inroads of other trades into this field are heard from business men following various lines of trade, but the answer is that competition as a natural influence will in the end bring success to those firms which conduct their business in the most economical manner, giving best service and fair prices to customers. The price cutter as a rule is short lived but he disturbs things while he lasts, and there is no proof that the

unobtrusive manner in which many of these cut-price plumbers operate really helps them to reduce costs any. An investigation would rather seem to indicate the opposite to be the case for showrooms and downtown offices have their place in influencing the public and in facilitating the merchandising of plumbing and heating equipment. While facing such price competition the plumbing concern which believes "every man is worthy of his hire" must develop new business, as an alternative, and judging from articles appearing in current issues of Sanitary Engineer many firms are doing so successfully.

High Powered Competition

IT IS seldom one hears of orders for manufacturing or process work going from Eastern Canada to the West. It may either be an indication of a change in practice or only a coincident, but the order for ornamental iron and bronze work on two big new additions to departmental stores in Toronto has been granted the Dominion Bronze and Iron Company of Winnipeg. It is odd that with the big freight haul on raw materials and finished product that a concern 1,500 miles from Toronto can outbid local concerns. It is another sign of the more highly competitive condition into which business is developing.

Business Insurance

"I FIND human nature reacting favorably," says a writer in

The American Magazine, "every time I publish a picture of a baby or any cute story about a child. All the world loves children. And now let me put in a piece of good advice to every business man who reads this: Don't ignore the children in your community; because one of the fastest growing things on earth is a child. The man who runs a store, a newspaper, a bank, or anything else depending upon the public for good will and support is the biggest fool on earth if he thinks he can ignore the children. The kid rolling a hoop under your feet, or roller-skating all over your sidewalk and making a lot of unnecessary noise to-day, is simply notice to you of the energy that is going to run your town to-morrow. A boy or girl fifteen or sixteen years old has only five or six years to go before he or she will be playing an important part in the affairs of your town, and every one of them is a potential factor to be reckoned with. Those of the older generation who find themselves being crowded aside by younger men and women are those who neglected to run along with those same youngsters when the running was good. The kiddie that you befriended to-day will love you and respect you as long as he lives, if he's the right sort of kiddie; but if you cuff or wallop him he will never forget that; either. Take my own case: The great influences that shaped my life were mostly commonplace incidents in the lives of a few kind-hearted men and women who said an encouraging word here and there, or did some helpful thing for me when I was a kid."

A MEDICAL man of high repute says that six years have been added to the lives of average persons since the year 1900. Sanitation has done it, he says, and sanitation may add another six years to the average quota if certain scientific suggestions are carried out by municipal, state and federal authorities. This is cheering news—much more comforting than all the talk and gossip about the ravages of tuberculosis, cancer and other diseases said to be lurking in the path and ready to spring upon humanity. Truly the plumber has a big responsibility toward mankind.

New Goods of Interest to the Plumbing Trade

Donnelly Pressure Relief Valve

The firm of Ira I. Nelson, plumbing specialties, No. 10 High St., Boston, Mass., have placed on the market a safety or relief pressure valve for use on range boilers and closed plumbing sys-

tems, as well as on hot water heating plants.

They claim that the use of safety valves has been strenuously advocated since 1917, as a safeguard for the protection of life and property.

They claim that to-day there are over 50,000 Donnelly Safety Relief Valves in use in this service in homes and other buildings and that their installation is being made in ever increasing numbers.

The Donnelly Valve, they claim, by reason of its superior design, material and workmanship, is admirably adapted for this service and that it has no interior springs and no weights of any kind. It is claimed that the setting mechanism is so simple that any mechanic can easily and quickly set it for any pressure from a fraction of a pound up, which is an exclusive feature.

Stainless Steel Water Fittings

The latest adaptation of stainless steel is to the casting of metal bath and lavatory fittings. With Gummerts, Ltd., Effingham Brass Works, Rotherham, rests the distinction of being the first manufacturer of fittings in stainless steel, and their achievement has involved

a costly and protracted series of experiments. The advantages to be derived from the use of such fittings are obvious and the cost of keeping clean the numerous water taps in hotels, public baths, hospital ships, suites of offices, and public institutions will, by the use of stainless goods, be eliminated. Non-tarnishable fittings should also be specially acceptable in hospitals where precautions have to be taken against septic dangers.

It is claimed that stainless steel possesses a further advantage over brass by reason of its greater durability. With certain waters the seats of the taps perish through corrosive action, but experiments under all conditions have proved that stainless steel is not affected by such action. It is said that immersion in seawater has no deleterious influence upon taps made of cast stainless steel.

Messrs. Gummerts are at present offering only three patterns, namely, the pillar type bath cock, the globe type bath cock, and a half-inch pillar type lavatory cock. It is understood that although on account of the heavy preliminary costs involved, the range of patterns has been limited as above, it will be increased later on and further adaptations in the use of the stainless metal may be introduced, such as to lavatory legs and standards, and towel airers.

It is stated that the new goods have an attractive appearance, the polish and color being equal to those of stainless knives. They are, however, necessarily more expensive than the ordinary brass or nickel-plated taps, but it is claimed that the extra cost is inconsiderable when the saving effected in cleaning and maintenance is taken into account.

Ratchet Tap Wrench

The Millers Falls Co., of Miller Falls, Mass., U.S.A., have just placed on the market a new ratchet tap wrench which will be catalogued under No. 58.

A few of the good qualities of this

tool which are claimed by the manufacturers, are as follows:— An efficient tool for working in close quarters and

in places inaccessible with an ordinary tap wrench.

Ratchet operates by means of cam in rear of shifter sleeve. Ratchet to right or left by turning shifter ring. In center is solid for use without ratchet.

Handle is held firmly in position by set screw. Knurled knob at top affords a means of steadying the wrench while starting the tap. Ratchet and pawls of tool steel. Steel jaws hardened and tempered. Case hardened sleeve. Length of handle 3½ in. Length over all 4¼ inches. Capacity up to ¼ in. taps. Polished overall. Weight each 7 oz. Packed 1/6 doz. in a pasteboard box.

Following items are reproduced from trade paper files of MacLean Publishing Company of June and July, 1903:—

* * * * *

"Montreal Pipe Foundry Co., London-derry, N.S., successfully cast the first lot of water pipes on May 28, the cast consisting of 100 pieces."

* * * * *

"The average wages of plumbers in the United States to-day is about \$3.50 per day. In some cities the men get as high as \$5 and \$6 per day but the general average is brought down by the smaller wages paid in towns."

* * * * *

"John Watson, of Montreal, was in Toronto on his way to Hamilton to attend the annual convention of the C.O.O.F. He was taken in hand by President Mansell and his visit was fully taken up with renewing old acquaintances."

* * * * *

"The National Association made no mistake in holding its session last year in Halifax. At former conventions there were not more than one or two delegates from the Maritime provinces. Secretary Perrier reports that Halifax Association will be represented by no less than five at the forthcoming convention in Montreal."

* * * * *

"W. M. Merrick, General President United Association of Plumbers, Gas and Steam Fitters, says never in the history of the plumbing trade have plumbers enjoyed better and more prosperity than at present. The association comprises about 20,000 members. In three months ending March 31 over 100 new local unions were added to the association."

* * * * *

"W. J. Burroughes, one of Toronto's former master plumbers, is visiting friends in Toronto. He has been in England for some time. None were more active than Mr. Burroughes in the organization of the National Association, he being past vice-president of that association. Through his efforts quite a few Toronto plumbers became interested in the local association."

THAT'S SO!

"Your advertisement describes this as all wool. It is nearly all cotton."

"Yes, that's the worst of the newspapers. You can hardly believe a word they say."

* * * *

KNOW THEM TOO WELL

The president of a small college was visiting the little town that had been his former home, and had been asked to address an audience of his former neighbors. In order to assure them that his career had not caused him to put on airs, he began his address thus: "My dear friends,—I won't call you ladies and gentlemen—I know you too well to say that."

* * * *

GOT TWISTED

An Irishman being awakened suddenly in the night by a cry of fire hastily donned his trousers and leaped from a second-story window. He alighted safely on the ground, but stood looking down at his trousers, which in his excitement he had put on hindside before.

A fireman came up to him and said: "Did the fall hurt you, Pat?"

"No," said Pat, "Divil a bit did it hurt me, but it gave me a divil av a twisht."

* * * *

WHO, INDEED?

Hub (with newspaper)—Listen to this, wifey. For every missionary sent abroad last year, Christian America sent 1,495 gallons of liquor.

Wifey—Merciful heavens! Who'd ever think missionaries were such drinkers?

* * * *

NOWHERE

"No, sah, Ah don't never ride on dem things," said an old colored woman looking in on the merry-go-round. "Why, de other day I seen dat Rastus Johnson git on an' ride a dollah's worth an' den git off at the same place he started at. I says to him, 'Rastus,' I says, 'yo spent yo money, but whar yo' been?'"

* * * *

DON'T WAKE 'EM UP

"Then, when you have finished your lecture," said the professor of elocution and deportment to young Dulle, "bow gracefully, and leave the platform on tiptoe."

"Why on tiptoe?" queried Dulle.

"So as not to wake the audience," replied the professor.

* * * *

NOT FOR THE PRICE

A red-readed boy applied for a job in a butcher shop. "How much will you give me?"

"Three dollars a week; but what can you do to make yourself useful around a butcher shop?"

"Anything."

Demonstration Truck At Work

Photos taken by Sanitary Engineer of the demonstration truck being used by the Ontario Government, as it appeared while on view in one of Ontario's towns. The upper picture shows farm pressure system, pump, etc., connected up to give water at the tap and supply the range boiler. A hand and electric pump are both shown, along with a syphon-model septic tank, etc.

In the lower picture the complete bathroom installation, with basin, bath, shower, and closet, all connected up, is to be seen. Mr. Newsome, the lecturer, is seen on the right.

There has been a splendid turnout of visitors at the majority of the demonstrations and keen interest has been taken in the effort to show rural people how they can have modern sanitary conveniences.

"Well, be specific. Can you dress a chicken?"

"Not on three dollars a week," said the boy.

* * * *

A HARD ONE

"You look like an idiot," thundered the disgusted man to his swell son, just re-

turned from college. "You grow more and more like a conceited, hare-brained, helpless idiot." Just then an acquaintance of the old gentleman entered the office and saw the youth.

"Hello, Charlie, back eh!" exclaimed the visitor. "You're looking more like your father every year."

"Yes," said Charlie, "that's just what the governor's been telling me."

News Notes From Coast to Coast

BUSINESS CHANGES

Montreal.—The business of H. A. Brosseau, plumber, has been dissolved.

NEW FIRMS

Winpenny Bros., have commenced a plumbing and heating business at 1239 St. Clair Ave., Toronto.

W. C. Chaplin has commenced a tin-smithing and furnace business at 971 Eglinton Ave., Toronto.

Herschell & Dixon have commenced a plumbing and heating business at Weston, Ont., Box 292.

Port Hope, Ont.—Harry B. Hugh, tin-smithing, heating and ventilating engineer, has commenced business.

INCORPORATION

Thos. Jas. McSweeney, plumber, and James Cresman Tresidder, tinsmith, Orillia, Ont., have been incorporated.

Pipe Products, Ltd., is incorporated with head office in Toronto and capital of \$1,150,000 to manufacture steel and metal pipe of every description, plumbers' and steamfitters' supplies, etc.

LEAVES FOR WESTERN TRIP

R. J. Millar, vice-president and general manager of the Pease Foundry Co. Ltd., has left for a trip through Western Canada as far as Calgary and Edmonton, for the purpose of looking over Western conditions and of attending the annual meeting of the western shareholders of the company at Winnipeg. Mr. Millar expects to be back in Toronto about July 9 or 10.

PROVINCIAL BOARD OF HEALTH OFFICER SPOKE TO SAULT ENGINEERS

Sault Ste. Marie—F. A. Dallyn, director of the Department of Sanitary Engineering of the Provincial Board of Health, gave a talk to the local Engineering Association at a banquet at the Y. W. C. A. on "Sanitation," dealing particularly with the water supply of the city.

Mr. Dallyn stated in connection with the Sault's water supply that it had great possibilities of danger from the source of supply and from the fact that the people are wholly dependent on chlorination. He was of the opinion that the Sault should have a different source of water supply. The supply is at present taken from the power canal.

There were about 20 local engineers present. Mr. B. E. Barnhill is president of the local Association.

Doings in the Plumbing and Heating Industry

OBITUARY

Antoine A. Levesque, plumber, Montreal, is dead.

PLUMBERS ENTER PROTEST

Hamilton, Ont.—Plumbers and steamfitters employed on the Welland canal will file a protest against the nine hour day ordered by Hon. James Muddock, minister of labor, according to word which reached labor leaders here.

CONTRACTS AWARDED

Montreal.—John Tweddle & Co. have contract of \$60,484 for plumbing, heating and ventilating of new school for Protestant School Commissioners.

Parry Sound, Ont.—W. H. Ferrar has been awarded the contract for the installation of the plumbing and pumping plants at the French River Bungalow Camps being erected by the Canadian Pacific Railway.

Dominion Plumbing and Heating Co. Moves to Larger Premises

Victoria, B. C.—After several years location in business on Blanshard Street, the Dominion Plumbing and Heating Company has removed to larger quarters, the new address being 733 Fort Street. This progressive firm found its old store too small for the increased business, especially in view of the fact that the addition of a line of stoves and ranges will require a larger sales room.

The new store is not only larger in floor space, but there is a mezzanine floor adapted for storage of surplus stocks, offices, etc. The store room runs through from Fort Street to the alleyway, giving the great advantage of a rear entrance for the movement of heavy goods as well as affording a convenient place for loading that will keep the front entrance to the store clear.

The Dominion Plumbing Company includes Mr. L. Stewart, whose practical experience in this business extends over a period of thirty years; Mr. H. Cluff, a second member of the firm, with over a quarter of a century devoted to the same line; and Mr. W. Bruce, a Victoria resident for many years. All are practical workmen, and since starting business they have built up an extensive jobbing and repair trade, as they give day or night service when emergency requires.

The front section of the store will be fitted up with all the latest stocks of bathroom and sanitary fixtures.

PERSONAL

J. F. Crowley has been on a visit of inspection to plants of the Kaustine Co., in Ontario and Quebec.

FAVOR PUBLIC CONVENIENCES

Edmonds, B. C.—Public conveniences will probably be installed on the shore of Deer lake at the foot of Sperling Ave., following the action of the council in committee. A. F. Nelson, who owns property in that district and who has been letting people use his place as a bathing beach, complained of the lack of conveniences and the matter was referred to the councillors and chairman of committee on health, who will look into the matter with the engineer. The council appears to favor the installation of rest rooms.

MUELLER'S MEN AT PICNIC

Sarnia, Ont.—Mueller foremen of the Sarnia and Port Huron plants joined forces in Port Huron and held a jolly picnic to Lakeside Beach where everything that goes to make a picnic a success took place. The Sarnia foremen in autos, paraded from the Mueller plant through the downtown streets of the city to the ferry dock. Crossing the river they were joined by their co-workers from the United States and the gathering, about 150 strong, motored to the Port Huron beach. At the life saving station they were the guests of O. B. Mueller.

CANADIAN SALES-REPRESENTATIVE APPOINTED BY WILLIAMS TOOL CORPORATION

A sales representative has been appointed in Canada by the Williams Tool Corporation of Brantford.

The firm was founded in Brantford by Messrs. Hall & Sons Co., Ltd., for the purpose of making pipe threading machines of a very high type. A new sales plan too has been established, —selling pipe threading machines "On Time" to the trade. And to further make their line popular a salesmanship programme has been planned, including the engagement of J. E. Newsome, oldest son of Edwin Newsome, of Sanitary Engineer.

Mr. Newsome, junior, has had much experience, being for a number of years with the Belleville Paper Mills Ltd., Dominion Wheel and Foundry Co., Ltd., Toronto, and for some time worked in the shop where the Williams pipe threading machines are manufactured. He was one of the salesmen of the United Electric Co., Ltd., Toronto.

A Toronto office has been opened at 504 Spadina Ave.

TENDERS TO BE CALLED FOR TWO SWIMMING POOLS

Edmonton.—Tenders are being called for by the city for the construction of two new swimming pools. Council has approved this action but as yet the location of the pools has not been determined.

Whitby, Ont.—A filtration plant costing \$55,000 is being erected here. It will cover an area of 12,000 square feet, and have a holding capacity of 1,467,750 gallons per day. The filtered reservoir, when full will hold 141,000 gallons, which will supply the whole town of Whitby and the Ontario Hospital.

DOMINION RADIATOR WIN FROM STANDARD SANITARY

Joe Hurst's Dominion Radiator team of the Toronto Plumbing Supplies league defeated the Standard Sanitary club by the score of 13—4 at Willowvale Park in a league fixture before a large crowd of fans. Gillen, on the mound for the winners, allowed only four hits, but was inclined to be wild, walking four and hitting two batsmen. Davis started on the rubber for the losers, and went along fairly well until the fifth, when he weakened, and was replaced by Richards. Davis struck out six batters in the five innings he was on the rubber.

Britton, Swing, Gillen and W. Radke were the big hitters for the Radiator crew, the former having a home run.

SAYS METERS WOULD STOP WATER WASTE

Calgary, Alta.—“We are consuming here on the average 170 gallons per capita per day, whereas 85 gallons per capita is considered by authorities to be an ample supply for all purposes without restriction as to use, but with proper restrictions to misuse,” said A. B. Silcox.

“If we allow about 15 gallons per capita in addition on account of the extreme aridity of Calgary, we are apparently wasting 70 gallons per capita per day.

“There are about 10,000 water services in the city so that the waste works out at about \$17.40 per service. This leak could be stopped by the use of meters. The cost of maintaining meters is said to be between 60 and 70 cents per year per meter. It would be possible to meter one district at a time. In this way the entire burden would not fall on any one year and might be paid for out of the saving.

“It is interesting to know that Winnipeg, 100 per cent. metered, uses about 65 gallons per capita per day. Toronto and Hamilton, with comparatively low average of meters, use 120 gals. per day.

“Twenty-six cities in North America, 100 per cent. metered, use 85 gals. per day; 8 cities less than 20 per cent. metered, use 235 gals. per capita per day. \$174,000, capitalized on a 30-year six per cent. bond issue, would provide a capital of \$2,230,000.”

BIG SEWAGE SCHEME FOR WESTON

Weston, Ont.—The town of Weston is embarking on a comprehensive scheme of sewerage, and James Proctor and Redfern have been engaged as a consulting firm acting in conjunction with Mr. Seymour, the town engineer, to prepare plans and carry out the work.

The plan briefly outlined provides for putting down sewers to cover all the eastern section of the town, from the north to the south limits, including the Trethewey property, and all that portion between the Weston road and 5th Avenue. From the preliminary surveys made, the scheme will, it is thought, not be a costly one, the lay of the land being favorable to draining to the disposal plant on the banks of the Humber River.

STOPS PLUMBERS CASE GOING TO SUPREME COURT

Calgary, Alta.—Mayor George H. Webster by his casting vote blocked an attempt on the part of the Labor aldermen to take the dispute between the steamfitters' and pipefitters' union and the Imperial Oil Company before a supreme court judge.

In clause 4 of the agreement between the city and the company it is set forth that the company agrees to pay wages equal to, if not greater, than the current union wages prevalent in Calgary. In the case of the disputed wages the company takes the wages paid at Ogden for steamfitters and pipefitters as a standard, and adds seven cents to this, paying 77 cents an hour. The union argues that building contracts pay 90 cents, and that this is the union rate.

F. J. DERRICK

Plumber of 248 Cedarvale Avenue, Toronto, Secretary of the York Township Master Plumbers' Association, who has done much good work throughout the winter and spring sessions.

INCREASE IN PETERBORO PERMITS FOR PLUMBING IN MAY

Plumbing permits issued in May numbered 43, as compared with 31 in April. During the month there were 16 outdoor closets done away with, bringing the total for the year up to 47, according to A. G. Methers, city plumbing inspector.

The May permits included 29 water closets, 20 baths, 25 basins, 28 sinks, 4 laundry tubs, 2 combination trays, 1 soda fountain, 7 floor drains and 1 drinking fountain. The drinking fountain is being installed in Victoria Park.

Inspections to the number of 119 were made, including 33 water tests, 32 smoke tests, 11 layouts and 43 miscellaneous. On satisfactory completion of the work permitted, 68 certificates were issued.

WESTERN ONTARIO NEWS

Contract for heating and plumbing for new \$8,500 residence at London, Ont., has been awarded to the Hunt Plumbing Co.

Tenders will be called early in July for new six-roomed school at Hanover, Ont. Prices will be wanted on steam heating system, plumbing and ventilating equipment. Architect W. G. Murray, Dominion Savings Building, London, Ont., is preparing plans.

A. D. Cameron, secretary of the High School Board at Mitchell, Ont., will receive tenders until July 14 for new \$60,000 high school. Steam heating, plumbing and ventilating equipment required.

W. Bere, 458 Piccadilly St., London, Ont., wants prices on hot water heating and plumbing for new duplex dwelling.

H. Peel, 139 St. James St., London, Ont., wants prices on hot water heating, plumbing, and electrical work, for new \$14,000 dwelling.

Contract for new steam heating system for the Court House at Goderich, Ont., has been awarded to Fred Hunt.

Watt and Blackwell, Bank of Toronto Building, London, Ont., are calling for tenders for new hospital to cost \$440,000 at Kitchener, Ont. Prices wanted on steam heating, plumbing and electrical equipment.

Noble and Rich, 237 Queens Ave., London, Ont., have been awarded the plumbing contract for new \$175,000 manufacturers' exhibition building at the Western Fair grounds.

Eggett & Co., London, Ont., have been awarded contract for heating in connection with alterations costing \$35,000 at the Byron Sanatorium.

Noble and Rich, London, Ont., have been awarded contract for plumbing and heating for new \$10,000 residence for Wm Abbott.

F. R. Reeves, 261 South Broad St., Sarnia, Ont., wants prices on steam heating and plumbing for new \$30,000 Sunday school to be erected by the Anglican congregation.

Harrison and Phillip, of Welland, Ont., have been awarded contract for new heating system for the West Side school at Humberstone, Ont.

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

STEADY improvement is noted in business during the past two weeks. Though the difference in the volume of business is small, and in some centers, is hardly noticeable from last week, the trend is generally, in most centres, a noticeable movement towards a greater volume of business, and an improvement in conditions.

Primary metal markets are showing signs of weakness of late; brass and copper scrap materials have declined to lower levels, and ingot metals have all weakened with the exception of antimony, which not only remains at its former price level but gives out a firm note. Montreal markets re-

port that copper, tin, lead, spelter and aluminum have declined in that center. Toronto markets have so far only felt this decline on tin and spelter.

Collections generally are a little on the side of improvement; overdue accounts in some centres are becoming easier to collect.

Taking the market all round, very few changes have occurred of late and fluctuations have been few in either direction. This will not be the case for long if the weakness continues in primary markets, as lower prices will soon manifest themselves in connection with manufactured articles.

Montreal Markets

MONTREAL, June 29.—The weakening tendency of the primary metal markets which continues this week without much indication as yet as to when the bottom will be reached has had a decided effect upon all manufactured products. Few price changes are being noted, higher quotations being out of order under the circumstances and lower prices not being advisable until it is seen whether or not there will be a recovery in the primary markets.

The only change of any importance to be recorded this week is a discount change on conductor sundries, the discount being reduced slightly, those on conductors remaining without change. In closet goods a local price readjustment on the Pussyfoot closet is also noted.

The scrap market reflects the tone of primary markets by a reduction in the prices on copper and brass, these reductions being on a very small scale as yet, though likely to be continued further if present conditions continue for any considerable period.

RADIATION GOODS MARKET IS QUIET LOCALLY

Montreal.

A quiet tone continues to rule in the radiation goods market locally. The following prices, which are unchanged, remain in force:

RADIATORS AND BOILERS—

Radiator list prices are for 1, 2, 3, 4 and 5 column radiators, per sq. ft.

45 in. to 38 in., \$1.32 in. \$1.10; 30 in., \$1.15; 25 in., \$1.20; 23 in., \$1.25; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60. Discount 44 per cent for hot water, and 45 per cent. for steam.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05; Discount 41 per cent.

Boilers—Round t water boilers, sizes from 0 to 10, 52 per cent. off list. Square or sectional hot water or steam boilers, 15 in., 3 per cent. with Ontario Government trimmings, list. Square or sectional water boilers, 19 in. to 36 in., 5 per cent. Square or sectional steam boilers, 19 in. to 26 in., 5 per cent. Ontario Government trimmings, list plus 7 per cent. Square or sectional water or steam boilers, 48 in., list plus 10 per cent. With Ontario Government trimmings, list plus 18 per cent.

Round steam boilers, standard trimmings, 16 per cent. Ontario Government trimmings, 13 per cent.

C.B. Montreal, Toronto, Guelph.

TRADING IN COMPRESSION GOODS IS FAIRLY STRONG

Montreal.

Business in compression goods remains fairly steady of late, a good amount of trading being handled by the local distributors throughout. Quotations have shown no signs of change from the levels established some little time ago, these being as follows:

VALVES AND BIBBS—

Compression work, standard	45%
Fuller work, standard	30%
Quick opening, compression bibbs	43%
Bath cocks, quick opening	38%
Bath cocks, compression	40%
Basin cocks, quick opening	46%
Flatway stop and waste cocks, standard	54%
Roundway stop and waste cocks, std.	42%
Brass steam cocks, standard, 1/4 in.	50%
Radiator valves, standard	55/25%
Do., removable discs	55/25%
Globe, angle and check valves, std.	25%
Gate or straightway	25%
Emco globe valves	33%
Emco check valves	33%
Jenkins globe, angle, check and swing check	plus 15%
Jenkins gate or straightway	plus 11%
Jenkins iron body, globe and angle	plus 10%
Jenkins iron body, gate	12%
N. P. "O" and "S" traps	34%

MINOR PRICE ADJUSTMENT ON PUSSYFOOT CLOSETS

Montreal.

Only one price change is reported in closet goods this week, the price of the oak vitro or Pussyfoot closet being reduced fifty cents. Trading locally is not as heavy as had been anticipated. Prices now in force are as follows:

CLOSET COMBINATIONS—

Low Down Outfits,	each
Closet, standard outfit, oak	24 00
Do., post hinge seat	25 00
Do., oak vitro or Pussyfoot	24 00
Do., post hinge seat	25 50
Do., mahogany vitro or Pussyfoot, post hinge seat and cover	28 00
Do., vitreous china, oak post hinge seat and cover	29 00
Do., vitreous china, mahogany post hinge seat and cover	30 00
Do., white vitro or Pussyfoot, mahogany post hinge seat and cover	30 00
Do., enamelled iron tank, oak post hinge seat and cover	29 50
Do., enamelled iron tank, mahogany post hinge seat and cover	29 50
Add for 3/4" valve on supply pipe	1 25
Add for spud	0 60
Add for reverse trap bowl	1 50
Add for syphon jet bowl	7 00
Deduct for supply pipe	0 80
Deduct for floor hinge	0 60

CLOSET BOWLS—

Richeieu bowl	8 00
Washdown bowl with spud	9 50
Reverse trap bowl with spud	9 50
Syphon jet bowl with spud	15 00

CLOSET SEATS—

Oak post hinge seat and cover	3 85
Oak wood strip seat and cover	3 50
Mahogany finish post hinge seat and cover	4 05

CLOSET TANKS—

Low down, oak vitro or Pussyfoot with fittings less seat	12 00
White vitro or Pussyfoot with fittings, flush elbow and supply	16 50
Vitreous china tank with fittings, flush elbow and supply	16 00
Enamelled iron with fittings, flush elbow and supply	16 00

CONDUCTOR SUNDRIES UNDERGO DISCOUNT REVISION

Montreal.

Local distributors of eaves and conductors report business to be fairly strong. Price adjustments have been noted on a number of conductor sundries

Makes Sales— Makes Friends

MUELLER A-2280 Combination Sink Faucet appeals instantly to every woman—unnecessary to urge its strong points—they show at a glance—that's why it sells quickly and easily. Its many convenient uses makes a friend and a prospective future customer.

Mueller Combination Sink Faucet A-2280

(Gives water in any part of sink
—not confined to certain radius)

Lessens dishwashing drudgery—sprays flowers—cleans vegetables—fills pails on the floor—cleans the sink—and saves the woman's hands.

Raising or depressing the center knob gives hot, cold or tempered water through spout or spray.

Rapidac construction—cone seat washer—3 feet of good red corrugated hose—a high grade **MUELLER** product at a reasonable selling price netting you a good profit.

Order a sample today. Fully warranted.

H. MUELLER MFG. CO., LIMITED
Sarnia, Ontario

Water, Plumbing and Gas Brass Goods and Tools

American Factory at Decatur, Illinois, U. S. A.
Branches, New York and San Francisco

Mueller Metals Co., Port Huron, Mich., Makers of "Red Tip" Brass Rod; Welding Rod; Brass and Copper Tubing; Forgings and Castings in Brass and Bronze; also Brass Screw Machined Products.

This **MUELLER** Faucet makes it easy to wash the dishes, without making the hands red and rough.

No. A-2280 (Patented)
can be quickly installed on any regulation sink, and will last a lifetime.

but discounts on the major items remain unchanged. The new discount on sundries is 50 and 10 per cent. Quotations in force locally are as follows:

EAVESTROUGH—

O. G. round and half round, per 100 ft. 3 in., \$16.90; 10 in., \$18.70; 12 in., \$22.20; 15 in., \$35.50; 18 in., \$45.00.

O. G. Square bead, per 100 ft.; 8 in., \$15.90; 10 in., \$17.70; 12 in., \$21.20; 15 in., \$34.50; 18 in., \$44.00.

Discount 65 and 5 per cent.

CONDUCTOR PIPE—Round, Plain and Corrugated, per 100 ft.; 2 in., \$18.40; 3 in., \$22.30; 4 in., \$29.60; 5 in., \$48.00; 6 in., \$58.80.

Discount 15 and 5 per cent.

CONDUCTOR ELBOWS—

Plain or corrugated, price per doz. 2 in., \$5.25; 3 in., \$6.00; 4 in., \$10.50; 5 in., \$24.00; 6 in., \$29.00.

Discount 50 and 10 per cent.

ENAMELLED WARE TRADING STILL REPORTED LIGHT

Montreal.

Sales of enamelled ware are reported rather light this week, although indications are for a revival of trading interest shortly in view of the heavy amount of building under construction in the district. Local quotations are:

ENAMELED WARE—

Sinks, flat rim—	1 only	2 only	3 only
16 x 24	\$ 7 50	\$ 7 40	\$ 7 30
18 x 30	8 70	8 60	8 50
20 x 30	9 90	9 80	9 70
Bath tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide			51 40
Bath tubs, 5½ feet.			57 10
Lavatories—			
17x19 in. Apron F139 or P4045			15 30
18x24 in. Apron F154 or P3845 or P3847			23 60
18x21 in. Apron F169 or P4205			17 60
17x19 in. Roll rim. F241 or P4345			12 60
Less 30 per cent.			

NO CHANGES NOTED IN PRICE ON WROUGHT IRON PIPE

Montreal.

Lapweld and butt weld wrought iron pipe prices are still based on list No. 59, issued some weeks ago, as follows:

WROUGHT PIPE

Price List No. 59. April 24th, 1923.

Standard Butt weld Pipe S/C per 100 feet.

Size	Steel Blk.	Gen. Galv.	Wrot. Blk.	Iron Galv.

WEAKNESS IS NOTED IN BRASS AND COPPER PRODUCTS

Montreal.

A weakness is again noted in the brass and copper markets locally this week. Quotations, however, have not yet shown a reflection of this tendency of

the market, remaining unchanged from levels which have been in force for several weeks past. Trading is very light in these products at the present time. Quotations are:

BRASS—

Sheets, base 0 27
Rods, ½ to 2 inches, round..... 0 24
Tubing, seamless, base 0 32

COPPER—

Rods, ½ to 2 inch..... 0 30
Soft sheets, plain, 16 oz. and heavier, lb. 0 33
Plain tinned, 16 oz. and heavier, lb. 0 40
Polished, and tinned, 16 oz. and heavier, lb. 0 44
Tubing, lb. 0 34

Above prices are for full sheets or bars. Cuts 5c. per lb. higher.

SUMMER DEPRESSION IS NOTED IN SHEETS AND PLATES

Montreal.

The sheet and plate market locally, is feeling the depressing effects of the summer season. No deviation from prices in force are noted, the following take in the range of the local distributors:

BLACK SHEETS—

10 gauge, base	4 75	5 00
12 gauge	4 85	5 00
14 gauge	4 85	5 10
16 gauge	5 05	5 15
18—20 gauge	5 20	5 25
22—24 gauge	5 20	5 35
26 gauge	5 25	5 40
28 gauge	5 35	5 60

GALVANIZED SHEETS—

	Queen's Head	Fleur de Lis
18-20 gauge	6 90 7 40	6 65 7 15
22 gauge	7 15 7 65	6 90 7 40
24 gauge	7 25 7 75	7 00 7 50
26 gauge	7 50 8 00	7 25 7 75
28 gauge	7 75 8 25	7 50 8 00

Other Brands—

10½ oz.	7 50	7 75
28 U. S. gauge	7 20	7 50

METAL LATH DISTRIBUTORS REPORT HEAVY SALES

Montreal.

Metal lath distributors report heavy sales during the past week or so, and are highly optimistic over the prospects of the season as a whole. Prices remain as follows:

METAL LATH—

	per sq. yd.
Painted—	
26 gauge	23c.
24 gauge	28c.
32 gauge	32c.
Galvanized, 10c. per sq. yd. extra.	

SOIL PIPE AND FITTINGS IN FAIRLY FIRM MARKET

Montreal.

There has been no change in the discount list on soil pipe and fittings during the past week, the revision made in April still holding good. Trading is re-

ported as being fairly steady. Discount lists are as follows:

SOIL PIPE—

2 and 3 inch	20%
4 inch	25%
5 and 6 inch	20%
8 inch	net

FITTINGS—

2 to 6 inch	37½%
8 inch	net

FIRM MARKET IS MAINTAINED FOR COTTON WASTES

Montreal.

The cotton waste market remains in a firm position locally. Quotations show no tendency to deviate from levels established early in the spring, as follows:

COTTON WASTES—	Per lb.
Cream polishing	0 24
White, XXX extra	0 20
White, XX grand	0 18½
White, XLCR	0 17

Colored cotton	0 13½
F.o.b. Toronto and Montreal.	

IRON AND STEEL PRODUCTS ARE WITHOUT CHANGE

Montreal.

Bar products remain in a firm market, with prices showing no change. The quotations are as follows:

IRON AND STEEL—

Common bar iron, 100 lbs.	3 95
Refined iron	5 45
Irish finish machinery steel	4 00
Mild steel	3 95
Single reeled machinery steel	5 50
Band steel	3 95
Sleigh shoe steel	3 95
Spring steel	5 00
Tire steel	4 15
Harrow tooth steel	3 80
Toe caulk steel	4 85
Mining tool steel, per lb.	0 19
Black Diamond tool and cast steel, per lb.	0 19

NOTE—Refined iron is approximately \$1.50 per cwt. over base, but fluctuates owing to unsettled market.

Band steel in scroll bundles, 50c per 100 lbs. extra.

Iron and steel 3-16 in. and thinner, 50c per 100 lbs. extra.

FIRM TONE IS MAINTAINED IN PIPE FITTINGS MARKET

Montreal.

The local pipe fittings market maintains a firm tone at present, although activity is not so strong as distributors would like to see it. Prices are without change, as follows:

PIPE FITTINGS—

Cast iron fittings	10%
Plugs, cast iron	10%
Do., solid	10%
Do., countersunk	10+
Bushings, cast	15+
Do., malleable	15+
Unions	30%
Flanged unions	10%
Flanged fittings	27½%
Dart unions, black, ½ to 2 in.	331-3%
Do., ½ in., 2½ in., and larger	23%
Do., galv. add to black	30%
Nipples, ½ to 4", close and short	50%

Complings 4" and under	25%
Do., 4½" and larger	50%

Malleable Fittings—

Price list effective June 1st, 1922. Discount 63 per cent.

Sanitary Engineer

Dominates in Its Field

Because—

SANITARY ENGINEER is the only plumbing and heating paper in Canada giving an up-to-date market service in each issue, from Montreal, Toronto and Winnipeg.

SANITARY ENGINEER has exclusive rights for publishing in the plumbing and heating field the splendid articles by Frank Stockdale, America's outstanding merchandising expert.

SANITARY ENGINEER uses more illustrations in the editorial section than any other Canadian paper in its field.

SANITARY ENGINEER is running the most complete and practical series on sewage disposal of any publication in Canada.

SANITARY ENGINEER is the only paper running in each issue a full page illustrated article on sheet metal work.

SANITARY ENGINEER is the only paper running a classified Buyers' Guide in each issue.

SANITARY ENGINEER runs the most up-to-date news service from coast to coast, outnumbering other publications in its field by more than five to one in the number of news items carried.

SANITARY ENGINEER'S editorial policies are conducted along sane, practical lines, based upon the experience of the very best authorities in their respective lines in Canada.

SANITARY ENGINEER is printed on better paper stock than any other paper in its field, thus showing up illustrations to better advantage.

SANITARY ENGINEER is uniform as to make-up, both in its editorial and advertising pages, thus making it convenient for readers.

SANITARY ENGINEER'S news of the trade, convention notes, convention reports, articles on legislation, are the brightest, breeziest, best-written and most complete reports issued to the Canadian plumbing and heating trades by any publication either in Canada or the United States.

SANITARY ENGINEER takes the lead in providing the trade with new, practical ideas, dealer helps, and proving through the printed word that certain plans are being carried out successfully by leaders in the industry.

SANITARY ENGINEER reaches the leading members of the plumbing and heating trade by paid invitation. Copies are not sent out indiscriminately. The paper is of real practical value to its subscribers, and they willingly pay a fair subscription price for it. This ensures reader interest and attention.

SANITARY ENGINEER carries in each issue a large volume of high-class advertising, and most of the representative manufacturers and supply houses use its pages regularly to carry their messages to the Plumbers and Sanitary and Heating Engineers of Canada.

SANITARY ENGINEER maintains, in addition to regular editorial and advertising staffs, correspondents located in the most important parts of Canada, and in this way provides readers with the splendid news service which is not duplicated by any other publication.

Subscription price, \$2 per year.

CORRUGATED SHEET MARKET IS SHOWING GOOD STRENGTH

Montreal.

Seasonable business is reported in the corrugated sheet market by local distributors, sales being very strong for this time of the year. Prices are without change, as follows:

CORRUGATED SHEETS—	Per 100 sq. ft.
No. 28 gauge	7 00
No. 25 gauge	7 50
No. 24 gauge	10 00
No. 22 gauge	12 50
No. 20 gauge	14 00
No. 18 gauge	19 00

Less 10 per cent.

Lighter than 24 gauge and wider than 27 ins., 75 cents per square extra.

BUILDING ACTIVITY AIDS SALES OF PORTLAND CEMENT

Montreal.

The season's heavy building programme, now well under way, is resulting in a strong trade in cement. Prices remain at the following levels:

CEMENT—

Car load lots, per bag, F.o.b. steam cars	0 85
Per Bag, delivered	0 94
Less car lots per bag, F.o.b. yard.....	0 94
Per bag, delivered	1 04
Rebate of 20 cents for empty bags.	

BRASS AND COPPER SCRAPS IN FRACTIONAL DECLINE

Montreal.

The scrap metal market continues to show a weakening tendency, brass and copper declining fractionally during the past week. A somewhat duller market is reported by local dealers. Quotations are as follows:

SCRAP—

Automobile Tires	0 50
Rubber Shoes	0 02
Yellow brass	0 07
Red brass	0 09
Light brass	0 04½
Scrap zinc	0 05
Lead, heavy	0 05
Lead, tea	0 03
Light copper	0 10
Heavy copper	0 11½
Wrought iron, R. Rd. No. 1 per gr. ton	15 00
Malleable scrap (ton)	14 00
Pipe scrap (ton)	10 50
Heavy melting steel	12 00
No. 2 bushing	6 00
Boiler plate	14 00
No. 1 machinery	21 00

PRICES ARE SLIGHTLY LOWER IN INGOT METAL MARKET

Montreal.

There is no improvement to report in the ingot metal market, and prices are generally slightly lower than those ruling last week. In view of the continued decline it is impossible to form any idea as to when the bottom will be reached, but there is no sign as yet of any change for the better. The position is somewhat obscure but present indications point to still lower levels being touched.

TIN.—This metal continues to decline and the recoveries are very brief and followed immediately by a further drop. It is probable that the June statistics will not be very favorable, and in the absence of any support to the market, the trend is all downward. From present indications the market may go another £10 or £20 lower. The local market is weak at 45½ cents per pound.

COPPER.—Both New York and London are again lower, although the decline is moderate and there is no marked weakness. There are no features of

particular importance beyond the light demand and a certain weakness in London which tends to depress prices. The local market is quiet at 19 cents for electro, and 18½ cents for casting.

LEAD.—This metal is slightly lower in all markets but the decline is gradual and will doubtless continue so until the bottom is reached.

SPELTER.—East St. Louis shows a further low point of \$5.75, but shows a light resistance at this level. With export business out of the question, the future depends on domestic consumption which is still rather light. Production is bound to fall off, which will in time

have its effect upon prices. The European situation is apparently the crux to the situation, and there is no improvement there. The local market is quiet at 9 cents per pound.

ANTIMONY.—This metal is the only one to show a firmer tone this week, with offerings from China one-quarter to one-half a cent per pound higher than recent quotations. Beyond the sentimental effect this has no bearing on local prices, which remain steady at 8¾ cents for high-grade English and 8 cents for Chinese.

ALUMINUM.—This metal remains unchanged at 24 cents per pound on the local market.

Toronto Markets

TORONTO, June 28.—Primary metal markets during the past two weeks have again seen declines of some importance in tin and spelter. A weak note is given out in connection with all other ingot metals except spelter, which still holds a very firm tone. The scrap metal market has a tendency towards weakness though no changes have yet been made. Solder has been reduced approximately 10 per cent, which affects all grades. A few adjustments have been made in the prices of closet combinations which do not amount to a great deal.

Local dealers, both wholesale and retail, report a fair week's business in most lines of plumbing and steamfitting goods. A slight improvement is being felt in the business of the last two weeks, over the two previous weeks.

SCRAP MATERIAL MARKET TURNS VERY WEAK

Toronto.

The scrap material market shows a very weak tendency; prices have fallen off in practically every line. Dealers report a very dull market with very little material moving.

ASBESTOS MARKETS ARE QUIET WITH LITTLE MOVING

Toronto

Asbestos products have not been selling in the volume expected. The market is inclined to be dull. Notwithstanding the fact that this has been the case for some time past, prices show no indications to decline. Magnesia products give out a very firm note, and some scarcity exists in this line.

ASBESTOS PRODUCTS—

Pipe Covering—	
Air cell, 4 ply	50 per cent. off list.
Air cell, 3 ply	55 per cent. off list.
Air cell, 2 ply	57½ per cent. off list.
Boiler Covering	\$1.50 — \$2.00 per bag.
Asbestos paper or felt.....	8.25 \$9.00
Magnesia pipe covering	less 40 per cent.
Magnesia pipe covering, small lots, less 35 per cent.	

Complete—The Famous Pittsburg Line

OF THE eighteen different sizes and types of Pittsburg Water Heaters there is one that will suit the requirements of every one of your possible customers.

Every one of the eighteen is the standard water heater of its type. They are built and guaranteed by the largest and the oldest manufacturer of copper coil heaters in the world. Behind them is a reputation and a record of over a quarter of a century.

Every one of them has features that can't be copied—features that help you to greater water heater sales.

And we help you sell them. Write and ask about our "Selling the Consumer" campaign—a direct campaign, scientifically planned, that has been a proven success in scores of territories. That same measure of success can be yours. Write to-day.

QUIET TONE NOTED ON BOILER STANDS

Toronto.

No great volume of business has taken place in boiler stands, prices are the same as previously published in Sanitary Engineer.

BOILER STANDS—

Each—5 gal. \$1.50; 12 gal. \$1.50; 18 gal. \$1.50; 25 gal. \$1.50; 30 gal. \$1.50; 35 gal. \$1.75; 40 gal. \$1.90; 52 gal. \$2.10; 66 gal. \$2.25; 82 gal. \$2.50; 100 gal. \$3.80; 120 gal. \$4.00; 144 gal. \$4.00; 168 gal. \$4.00; 192 gal. \$4.00; Adjustable Stands 12 to 14 inch 60c. Stahl boiler stand, 70c.

PRICES ON CLOSET COMBINATIONS ARE ADJUSTED

Toronto.

Wash down bowl which was \$10.60 is now \$10.00. Reverse trap bowl which was selling at \$12.10 has been advanced to \$14.00 each, and siphon jet bowl which was \$17.00 is now listed at \$18.75 each. The price of the Richelieu bowl remains unchanged.

The white enamel closet tank (low down) No. F585 or P9262, or white vitreous china Belmeade tank with bend and supply fittings which was selling at \$18.00 to \$18.90 has advanced in price to \$19.25.

Closet seats, mahogany finish, post hinge with cover, have been reduced from \$4.75 to \$4.05.

Addition of \$2.25 if closet combination is supplied with B.O.T. reverse trap bowl has been changed to \$1.50 and if supplied less N.P. supply pipe deduct 60 cents instead of 70 cents.

Mahog. Fin. Post Hinge Seat and Cover	4 05

SALES IN TIN PLATES ONLY FAIR

Toronto.

Tin plates have not fluctuated in price. The sales in this line have only been fair during the last two weeks.

Most of the tin plates being sold in Canada, and especially the better vari-

eties, are being made in England. Out of five of the tin smelters in the United States, two will be closed down by the first of the year, and will remain closed until the return of better business conditions. Before the war no tin smelters existed in the States, all the tin concentrates from Bolivia and Singapore being sold to England and Germany to be treated and the finished plates were sold to the U. S. During the war five smelters were built, some of which are now being forced to close on account of not being able to compete with British exports of tin plate.

KERR VALVES

No. 43—Screwed

The illustration here is of our genuine WEBER PATENT Bronze Gate Valve.

All old timers remember it as the best made and best appearing gate made in Canada.

It earned its reputation years ago, and still maintains it. It has stood the test of time.

What better recommendation could one ask for a valve, than to meet all comers for 40 years.

It has had its imitators, but the genuine Kerr Weber Gate leads the procession.

Get out in front and use Kerr's Weber Gates. You will see the difference.

YOU'LL USE 'EM YET!

Advantage No. 5

They provide the modern sanitary way to install radiators—easy to clean underneath.

For ANY style radiator; ANY type wall construction.

Write for the whole list of their advantages.

Healy-Ruff Co.

Dept. 23

Minneapolis, Minn.

"Made in Canada"

A Suggestion

"Medium Weight soil pipe has a round bead pattern at the hub to distinguish it readily from the Extra Heavy weight pipe which has a flat bead pattern.

This is only a matter of design, one being as strong as the other.

We respectfully suggest the advisability of continuing the excellent practice of invariably specifying medium weight pipe in the round bead pattern."

CO., LIMITED**

Strong - Handsome - Durable

JENKINS

Bronze

Swing Check Valve

Equipped with Renewable
Composition Disc

These Valves have the Jenkins Renewable Disc feature. Angle of seat assures ready opening at low pressure and the shock of closing under high pressure is absorbed in the line piping.

Disc lifts well out of passage. Hanger is heavy and has large bearing surface for carrying disc holder.

Valve illustrated is Fig. 475, Standard Pattern, suitable for 150 pounds working pressure.

Catalog No. 9 describes valve in detail. Write for free copy.

2 to 6 inch	Less	37½%

PRICES ON CORRUGATED SHEETS ARE FIRM

Toronto.

See following list for prices on corrugated sheets, which are firm in price with steady trading.

CORRUGATED SHEETS—		Per 100 sq. ft.
No. 28 gauge	7 00
No. 26 gauge	7 50
No. 24 gauge	10 00
No. 22 gauge	12 50
No. 20 gauge	14 00
No. 18 gauge	19 00
Less 10 per cent.		
Lighter than 24 gauge and wider than 27 ins.		
75 cents per square extra.		

STRONG TONE TO SOIL PIPE AND FITTINGS

Winnipeg.

Soil pipe and fittings continue in a firm position. The demand for this line is good at the present time and no change in quotations is expected.

CLOSET COMBINATIONS AT LOWER PRICES

Winnipeg.

A slight reduction is in effect on China tank closets. One line with oak seat and lid and tank fitted with compound lever ball cock is quoted at \$32.

REVISION IN DISCOUNTS ON RADIATOR FITTINGS

Winnipeg.

A revision in discount is recorded on radiator fittings such as valves and elbows. The new discount is 55 per cent.

COPPER RIVETS AND BURRS AT LOWER LEVELS

Winnipeg.

A reduction in the price of copper rivets and burrs is announced and the following prices prevail on the local market:

COPPER RIVETS—	
Per lb.—No. 8, 47½¢; 10 51½¢; 12 55¢.	
COPPER BURRS	
Per lb.—No. 8, 47½¢; No. 9, 49½¢; 10 51½¢; 12 55¢.	
COPPER RIVETS AND BURRS ASSORTED—	
No. 8, per lb. 50½¢; No. 9 55¢; No. 10 57¢.	

EAVE AND CONDUCTOR PIPE CONTINUES STEADY

Winnipeg.

There are no changes in the prices of eaves and conductors on the local market. With increased building activity an improvement is noted in the demand.

LEAD AND ZINC GOODS UNCHANGED

Winnipeg.

No changes have occurred in prices on lead and zinc goods. A seasonable amount of these goods is in evidence.

GOOD DEMAND FOR COTTON WASTE

Winnipeg.

Dealers report that sales of cotton waste are showing an improvement and quotations show no change.

Calgary, June 28.—Conditions look so promising for a bumper crop that nearly all early buying for fall will have to be reconsidered and to a good extent increased. Each week's crop report, without exception, confirms the optimistic reports of previous weeks and adds a little hereto. Rainfall for the last thirty days has been eleven inches, the heaviest in June since 1902. With the warm growing weather between rains, the crop is advanced fully two weeks and an early harvest is almost assured. Samples of wheat thirty inches high are shown, which in some cases are beginning to head out. The hay crop is very heavy, and stock and dairying are showing the results of plenty of feed. Judging by displays and advertising, competition is keen on summer lines, which are active,

Winnipeg, Man.

WINNIPEG, June 28.—Merchants from all centres report that business is steadily improving, and as crop conditions in the West are encouraging and a bumper crop is expected unless something unforeseen happens, more optimism and confidence is shown. There is a firmer tone to plumbers' and steamfitters' lines. Galvanized sheet iron as well as black steel sheets have moved upward. Kitchener bibbs and bath supply pipes have also shown an advance. Wrought washers have declined and lower quotations are in effect. There is a strong tone to soil pipe and fittings. Copper rivets and burrs show a slight decline. Water pressure drainers are quoted at lower levels. There is a revision in discounts on radiator fittings and new list price is in effect on swing check valves. Lead and zinc goods continue steady. Cotton waste is showing an improvement in the demand.

GALVANIZED SHEET IRON AT HIGHER LEVELS

Winnipeg.

An advance has been recorded in quotations on galvanized sheet iron, and the following prices are in effect:

SHEET IRON—Galvanized—		Per 100 lbs.
Size 16 Gauge	8 25
Size 18 Gauge	8 40
Size 20 gauge	8 40
Size 22 gauge	8 55
Size 24 gauge	8 55
Size 26 gauge	8 70
Size 28G x 30	9 00
Size 28G x 36	9 30
Size 10¾ ounce x 30	9 40
Size 10¾ ounce x 36	9 70

BLACK STEEL SHEETS MOVE UPWARD

Winnipeg.

In sympathy with the strength of the steel market an advance has been recorded on black steel sheets on the local market and the following prevailing prices are in effect:

BLACK STEEL SHEETS—		Per 100 lbs.
Size 10 gauge	6 35
Size 12 gauge	6 35
Size 14 gauge	6 50
Size 16 gauge	6 55

BATH SUPPLY PIPES MOVE UPWARD

Winnipeg.

Some lines of bath supply pipes have advanced. One line nickel-plated and brass tubing is quoted at \$2.95 per pair. Another line with slip joint nut for half inch inside pipe connection at floor is quoted at \$2.75 per pair.

WROUGHT WASHERS AT LOWER LEVELS

Winnipeg.

A decline in quotations is recorded on wrought washers and the following sizes are quoted as listed below:

WROUGHT WASHERS—		Case Lots	Less
		Per 100 lbs.	
Size 3-16 in.	14 10	14 60
Size ¼ inch	12 48	12 98
Size 5-16 in.	11 76	12 26
Size ¾ in.	10 95	11 45
Size 7-16 in.	10 32	10 82
Size 1½ inch	9 96	10 46
Size 9-16 in.	9 87	10 37
Size 5¼ in.	9 78	10 28
Size 3¼ in.	9 69	10 19
Size 1½ in.	9 60	10 10
Size 1 inch	9 60	10 10
Size 1½ in.	9 60	10 10
Size 1¼ in.	9 78	10 28
Size 1 7-16 in.	9 78	10 28
Size 1½ in.	9 78	10 28

KITCHENER BIBBS MOVE UPWARD

Winnipeg.

A slight advance has been recorded on the Kitchener bibb. Nickel plated, swan neck half inch, is quoted at \$24.75 per dozen.

REDUCTION ON WATER PRESSURE DRAINERS

Winnipeg.

A slight reduction is in effect on Penberthy water pressure drainers, and quotations are \$1.75 each.

NEW LIST PRICE ON SWING CHECK VALVES

Winnipeg.

Dealers have advised the trade that a new list price is in effect on swing check valves and the various sizes are as follows:

SWING CHECK VALVES—Each—	
Size ¾ in. \$1.20; 1½ in. \$1.30; ¾ in. \$1.90;	
1 in. \$2.60; 1¼ in. \$3.60; 1¼ in. \$5.00; 2 in.,	
\$7.50; 2½ in., \$14.00; 3 in., \$21.00. Puls 20 per cent.	

USE

TESTED Soil Pipe

IT COSTS NO MORE AND YOU KNOW THE JOB IS RIGHT

Manufactured by

FORWELL FOUNDRY, LTD.

KITCHENER, ONT.

A Real Leader

The Marvel, extra heavy and electric welded, is as efficient in operation as it is simple to install.

It is a combined range boiler and gas water heater doing away entirely with the old side-arm combination.

It holds and consumes every unit of heat, thereby needing less gas; the special Marvel burner produces a green-blue flame that heats the entire capacity of the tank in a very short time. It is silent, odorless and safe.

It is sold only through plumbers and yields a generous profit.

Are These The Opportunities You're Looking For?

Fan Heating and Ventilating Engineering is the pinnacle of all other forms of heating, and of all branches of steam fitting and sheet metal work. It prepares you for:

1. For Employers it enlarges their business opportunities 100%.
2. Employees it raises to Foremanship of a large shop.
3. Or as Designing Engineer of some large Heating Contractor.
4. As an intelligent Salesman of Heating Appliances.
5. As Chief Engineer with a Heating or Furnace Manufacturing Co.
6. Later a Consulting Engineer to Architects and Building Contractors, etc.

Which of These Are You Working for?

Full Information Free.

☐ Fan Heating and Ventilating Engineering. ☐ Sheet Metal Design and Pattern Drafting.

☐ Business Management, for office folks.

Select Your Course.

Type No. 140—Made in all Patterns.

The interchangeable parts shown below are of selected, time-tested materials that insure long life. Ultimate renewals may be made at a minimum of cost and inconvenience.

Dunham Packless Radiator Valves

With Wheel-Type Handle and Interchangeable Parts

This is constructed with built up bellows just like the Dunham-Lever Handle Valve and can be fully opened or closed with approximately one turn of the handle. It is particularly popular with heating contractors because of its effectiveness on steam or hot water type radiators and its convenience for either top or bottom connection. Sturdy, good looking and absolutely leak proof.

Write to us for additional information or consult our nearest branch office.

Burnham Boilers

A Grave Fact

It has the same 3 times back and forth fire travel, and between section flues as the regular Burnham sectional. Long on fire travel, short on coal bills.

It's a wise man who digs his own grave in which to bury his troubles.

The Burnham Round Sectional boiler is a grave digger. It digs right in and buries your heating troubles.

It's sectional in construction, and a whale in the work it does.

Sections can slip through the usual door opening.

Send for circular.

FARRFHERN CONDENSATOR

The only machine of the kind designed for service on low pressure Steam Atmospheric and Vapor heating.

The distinguishing features are a short sensitive leverage which assures the positive operation at all time.

The Steam enters the Top of the Tank with the Steam Valve high up, thus preventing flooding of the Steam line.

The water ways are large, thereby accelerating the return of condensation and discharge of air.

It is the simplest, most durable and dependable equipment that can be placed on any Steam Heating System.

Makes Plumbing and Heating Jobs Really Safe

THE use of safety valves on Range Boilers, Closed Plumbing Systems and Hot Water Heating Plants has been strenuously advocated since 1917, as a safeguard for the protection of life and property.

To-day, over 50,000 Donnelly Safety Relief Valves are in use in this service in homes and other buildings and their installation is being made in ever increasing numbers.

The Donnelly Valve, by reason of its superior design, material and workmanship is admirably adapted for this service. It has no interior springs and no weights of any kind. The setting mechanism is so simple that any mechanic can easily and quickly set it for any pressure from a fraction of a pound up, an exclusive feature.

By suggesting the use of a safety valve in connection with hot water heating and closed plumbing work, the heating and plumbing contractor not only renders a real service to his customer but incidentally makes an additional profit on each job. A Donnelly Safety Valve saves going back to the job—once installed it never fails.

Ask Your Jobber or Write Us.

The Donnelly Pressure Relief Valve for closed plumbing and hot water heating systems makes homes safe.

If you have device of equal merit to our Pressure Relief Valve we will consider marketing same.

Dart Unions

Locked beyond possibility of leakage

The use of Dart Unions is positive insurance against leaks.

Heat, cold, expansion, contraction or vibration are encountered and overcome.

The joint being Bronze to Bronze and the Malleable Iron Pipe Ends and Nuts being of extra weight ensures that the Dart will "stay put" till taken apart with a wrench.

Seven Points of "REX" Union Superiority

- 1 "Rex" Unions are tested and guaranteed to stand 250 lbs. working pressure.
- 2 The counterbored ends prevent the first thread becoming battered and permits an easy entrance of the pipe.
- 3 They will not corrode and will withstand vibration, expansion, contraction, fluctuating pressures and other severe conditions.
- 4 The bronze to iron seat, as used in "Rex" Unions, is recognized as the best known combination of metals to be used for permanent joints and where frequent disconnecting is necessary.
- 5 The octagonal shape of the three parts permits of connections being made with an ordinary monkey wrench.
- 6 The uniform diameter of the waterway insures an unobstructed flow and thorough drainage.
- 7 "Rex" Unions can be supplied threaded to either Briggs or Whitworth Standard and can therefore be used for your export trade.

A Proof of "Rex" Union Superiority
Canadian Car & Foundry Company, Limited
Montreal, Que.

FITTINGS, LIMITED, Oshawa, Ont.

Dear Sirs:—Confirming our conversation with regard to Rex Unions; as you are aware, we have recently purchased from your Company a large quantity of Rex Unions, and have found them satisfactory in every respect. They appear to have more metal in them than other Unions, and we also find them interchangeable; in fact we are very well pleased with them and intend specifying your Unions on our orders where we can consistently do so.

Yours very truly,

Testing Time

Both before and after Vitro Fittings are installed in Vitro Tanks they are carefully tested and all necessary adjustments made.

These tests and inspections are so stern and exhaustive that any latent weakness is brought to light, any defective material exposed. Everything on every Vitro is working smoothly and is ready for operation when it leaves the factory.

Combined with mechanical excellence the New Design Vitro has, also, beauty of line and beauty of finish. It looks the aristocrat it really is.

—And this beauty is changeless. Never will it crack, chip or stain. The long years of its unfailing service mark its real testing time and its triumph.

Sell "Dayton" Pumps

Under the New

"Dayton" Plan

We have been preparing this plan for months. It is different. It works simply, too—like this:

You send us a list of twenty-five or thirty people who can profitably use a "DAYTON" Water Supply System. We then mail a series of five handsome advertisements to these prospects—advertisements that will interest, convince and sell. Each mailing piece carries YOUR name and address on a return post card. Our name is not shown.

We pay postage and all mailing expenses.

You get all the enquiries.

You close all the sales.

You don't risk a cent.

You are bound to profit.

Send in a list of prospects to-day, or if you wish to know more about this plan, just send the coupon and say you are interested. We will send full particulars by return mail.

THE NEW *Little Giant* PIPE WRENCH

Patented Feb. 4, 1913

Better Than Any Wrench
You've Ever Seen, Isn't It?

The strong head with the extra long handle, powerful jaw and nut—only three parts, of drop-forged, carefully heat-treated steel. A combination of simplicity and skillful design that makes a light, easy tool without cumbersome frame, rivets or delicate springs.

Two sets of teeth on the heads of smaller sizes and four on the larger not only double or quadruple the service life of this wrench but add to its adaptability in use.

With superior design and sturdy build the LITTLE GIANT is given greater leverage to save muscular energy when turning the tightest nuts and pipes.

It is ready to serve you as it is now serving hundreds of other wrench users who consider the LITTLE GIANT indispensable to their plant equipment.

Let us show you what users have to say of its performance. Write for circular No. 300E and name of nearest dealer.

ONLY THREE PARTS

Practically Indestructible

Note teeth on both sides of jaw.

A Letter from E. H. Gurney To the Canadian Trade

I received the following communication yesterday. We have passed it round the office and now we want to show it to our customers. It reads:

"My Grandfather bought a Gurney Stove in the days when your Grandfather was head of the Gurney Foundry. My Father bought a Gurney Furnace and Stove when your Father was head of the Company. And we have in our home a Gurney Furnace, a Gurney Gas Range and a Gurney Jacket Water Heater purchased since you succeeded to the Presidency of the Gurney Company. Three generations of have used the products of three generations of Gurneys, and all because of the satisfaction given by Gurney products. I wonder if you realize the value of the good old name 'Gurney' to your institution. It is a name that stands for quality and in which people have confidence. They know that if they buy anything made by Gurney they are buying satisfaction along with the article. I just pass this thought on to you, not because I am a personal friend of yours, for I have never met you, but because I have a friendly feeling towards the Gurney products that have served three generations of our family."

Our organization will try hard to live up to this, and I hope that the present Management, the result of these years of history, may carry on to serve three or more coming generations of the family of our good friend.

Faithfully yours,

A handwritten signature in dark ink, appearing to read "E. H. Gurney", with a long, sweeping horizontal line underneath.

President.

THE GURNEY FOUNDRY COMPANY, LIMITED.

"Everything for Heating and Cooking"

The Plumber Must Be a Teacher

Some men are content to put in any line of plumbing goods on any job. They don't care. And they don't go far. Other men, looking into the future, install the best equipment the job will stand. They talk about "pedestal lavatories," "built-in baths," "two bathrooms instead of one," "a bathroom for every two bedrooms," and so on. These plumbers are teachers. They are educating people to better living and greater comfort. They are creating satisfied customers and building bigger for themselves. Are you a teacher?

We back up our goods with a splendid campaign of advertising in rotogravure sections of Canada's biggest papers and in our leading magazines and farm journals.

“The Heart of the Disposal System”

The Gift of Gab

It is not at all necessary to have the god-like raiment of a movie-actor and the line of talk that Billy Sunday throws to make a whale of a hit selling disposal systems.

Just a plain, straight forward presentation of your case is all that is necessary; straight talk and persistence.

The convenience, comfort and healthfulness of complete indoor lavatory equipment are self-evident things—you don't have to argue about them.

The only sales resistance is the unwillingness of the farmer to separate himself from the necessary funds.

Intelligent, tactful, persistent effort will wear down this resistance.

Get the women folk interested—that helps a lot.

Says Water Systems Going More to Cities and Towns Than Farms

Speaker Quotes Authorities for Saying Demand for Plumbers' Supplies Will Continue Active Through Summer and Fall With Prices Strong Through the Summer—Suggests Campaign for Modern Plumbing Home and Remodeled Old Home

Address by C. A. KUEBLER, Vice-President Duro Pump & Mfg. Co., before Convention National Association of Master Plumbers

SOME time ago we heard a lot of talk about a depression coming and were advised to be careful and not get caught. This was very good advice for as a result nearly everyone has been watching carefully and not making too many future commitments, so that the chances for a big depression are remote. There will no doubt be a decline in business for the balance of the year, but we feel that if proper sales methods are used that you can hold up your sales volume not only on water systems, but on your other lines as well.

I have picked out a few statements from several sources in regard to general business conditions.

Babson says, "That we never go into a depression when everybody is looking for it. It usually falls upon us when we are least aware."

The feeling in conservative circles is that the situation is more satisfactory because of this check. The pace in March was too fast to be maintained.

Plumbers' supplies—Babson quotes—"Demand should continue active throughout the summer and fall. Prices will remain strong through the summer."

Therefore, we ought all of us feel very good about general business conditions.

Water System Business for the Balance of the Year

We predict the water system business for the last six months of the year will be better than the first six months. Business for first six months is better than any six months' previous period. January and February are usually the lowest months and they are out of the way.

Market for Water Systems

Water system business has been rapidly increasing every month since the lowest point of depression, July, 1920. In the years, 1918, 1919, and 1920, the farmers' business represented quite a large proportion of our business as well as every water system company. You all are aware of what has happened to the farmer and the fact that he has not bought any more than he had to buy for several years. It was, therefore, necessary to develop business more in the cities and suburbs, particularly in the suburban districts. This was done and in spite of the low purchases of the farmer the total sales have been increased considerably over previous years, even more than in the boom period. But the farmer is coming back rapidly, and is a much better prospect now than he has been for some time. Only one out of ten farm homes have water piped into the home. This does not mean that one out of ten has a modern water supply system. The

farmers' increased purchases of water systems will add materially to the present volume. Not over 20 per cent. of farmers have been sold modern electric water supply systems.

As for the suburban building, we predict this is where you will make your money for the next ten years. There is a shortage of suburban homes. People are moving from the cities to the suburbs to get away from higher rent, and to get fresh air and the other inducements that a suburban home affords. This will mean thousands of water systems required as electric current wires are extended nearly everywhere much further out than the city water mains.

In addition to the farm and suburban market, there is the cistern pump installations in hard water cities and towns and summer resorts, but one of the biggest sales possibilities is the small town without a city water plant being served by electric current from a high line, or adjacent city.

Furthermore, the market for water systems is being widened by the ever-increasing distribution of electric service lines. Ever since the war, electric companies and large electric syndicates have made tremendous strides in projecting their lines everywhere.

The chief advantages of a single super-power system are that it provides the nation with the maximum amount of power at the lowest cost and can distribute it to the greatest number of people. This accomplishment will improve the standard of living of everybody. The burden of the housewife will be lifted by electric labor-saving devices. An ideal form of power will be given to the farmer. This will lead industry to seek the country, where rents are low and raw materials accessible. It will then become possible for large numbers of people to earn their living away from the crowded areas, and since electricity will make rural life both comfortable and attractive, we can confidently expect that the people will spread out into the open, where they will find fresh air and health. What does all this mean? It means that electric current will be available everywhere, but water under pressure will not be. This will continue to open an increasingly large field for water supply systems and an increasing market for the other things which follow in the way of modern bathroom equipment, etc.

Small towns without water pressure being electrified from adjacent cities also have many soft water prospects.

Methods To Get This Business

Let me ask you a few questions first. How many of you take advantage of the National Trade Extension Bureau and use all the real sales helps that they have available? (As distributed in Canada by Sanitary Engineer). It does your heart good to see the big steps that the plumbing industry has

taken the last few years, but there is opportunity yet to do much more.

The plumbers in every community and city should get together and work co-operatively—advertising and in every other way. You hear of the electric home, you hear of the Home Beautiful, and every other kind of home but you never hear of the Modern Plumbing Home. Would it not be a good idea to do something along this line?

Also, as you are interested in putting modern plumbing in all classes of homes why not institute a campaign all over the country on a Remodeled Old Home? Get an old home and remodel it, put in modern plumbing equipment, obtain the co-operation of the furniture dealers and others in the city, advertise jointly, and we believe you would develop quite a lot of interest in remodeling old homes and especially in putting in modern plumbing equipment.

How many of you read your trade paper thoroughly? When you have finished do you pass them on to your journeyman plumber, and the others in your employ? You will find many fine ideas and suggestions in these papers. Why not give your journeyman plumber an opportunity, too, to learn more about the business? Why not develop him into a salesman for you when he is out working? If you will develop him and give him an opportunity to be worth more money to you and himself there will be less chance for him going into a business himself. This thought has struck us so forcibly that we have started, as soon as possible, to prepare a sales correspondence course for the use of journeymen plumbers, free.

Municipal Water Plant

Without the municipal water plant, where would the plumber be? It is absolutely a necessity to his life. Without it there would be no need for a plumber. The water systems in the suburbs or country afford the same opportunity for the plumber developing his business as the city municipal plant. Domestic water supply system is the municipal system to the suburban home owner and farmer. It increases your outlet for plumbing material. Therefore, let's increase the size of the outlet.

One of the things that we have never been able to solve and that is the resistance to selling plans that we have found among a certain class of plumbers. Unless the plumbers co-operate and are willing to follow out the plans of selling that are suggested, all the national advertising that we do, or all the millions of letters which we send out to prospects to help them to make sales and all the tons of literature which we send out for distribution, all the millions of people who are seeing the motion picture films, will be of no avail unless you and your associate master plumber follow up the leads and suggestions 100 per cent. to get the water system business.

The plumbing industry has made great strides but there is a goal to reach.

Our part of the goal is to put a water system in every home beyond city water pressure. By so doing, we will do our part in advancing the industry. We feel the surface of this business has only been scratched. The unlimited field and ever increasing size of outlet will create a demand for them that will tax the capacity of every manufacturer making

them and will be looked upon by the plumbing trade as a big part of their business providing a large share of their annual profits. The sale of water systems is daily proving to be a more desirable business for thousands of dealers. Those making a real study of this business and then pushing it hard are reaping the largest rewards.

System Handles Thousand Gals. of Sewage Per Minute

Imhoff System at Burlington, Ont.

Sewer Pumping Station,
Burlington, Ont.

Editor, Sanitary Engineer,

Enclosed find \$2.00 to start me over again on "Sanitary Engineer," which I enjoy very much. I find lots to interest me in your paper. Enclosed find two photos if you are interested, of the sanitary end of our town of Burlington. We have installed two more new pumps not shown in the picture and we are in a position to handle 1,000 gallons per minute. The disposal end of it is the Imhoff System. The whole of this work is in my charge and I am proud to say I am an old Parkdale boy, having been born and raised there.

If you ever travel the Hamilton Highway, stop and rest and look around. You will be welcome here anytime.

Supt. of Sewers, HARRIS MERCER.

R. J. Miller, vice-president and general manager, Pease Foundry Co., Toronto, has returned from a business trip through the West.

Dollar Will be Maximum Tax After August 1

No Cheques or Receipts Will Bear Taxation in Excess of One Dollar—Cannot Use Postage Stamps Any More for Excise Taxes

OTTAWA, Ont.—On and after August 1st, one dollar is the maximum amount of tax payable on cheques, bills of exchange, receipts for money paid to a person by a bank chargeable against a deposit of money in the bank to his credit, express money orders, travellers' cheques or post office money orders.

On and after October 1 postage stamps may not be used in payment of stamp taxes for revenue purposes. Excise tax stamps only may be used, and they may

be bought from any collector of customs or any bank.

The tax on receipts makes taxable receipts for \$10 or upward on post cards, form letters and letters, and this comes into force on and after August 1. The amendment to the act also provides that a receipt liable to the tax shall not, except in criminal proceedings, be given in evidence or be available for any purposes unless it be duly stamped in accordance with the law.

The new sales tax is effective from January 1, 1924.

Jobbing Business Stimulated in Summer by Plumber's Novel Plan

Public Complaint of High Charges for Small Jobbing Work Influenced Sault Ste. Marie Plumber in Starting Out a Truck With Two Men for Such Work—Public Pay Less and Profit Per Hour to the Plumber is Greater

THE PUBLIC COMPLAINS

that during the Summer Months when building is at its height, it is very difficult to obtain a Plumber for small jobbing work. To keep up our reputation for giving service to the public, we have detailed two men to handle jobbing work, exclusive.

Select Plumbing & Heating Co.

797 Queen St.

Phones 1668—Res. 1028w

THERE has frequently developed some difficulty in various plumbing and heating shops in connection with the handling of small jobbing work during the summer months when due to the activity of new building, plumbing and heating engineers are ordinarily pretty busy. Taking advantage of the situation the Select Plumbing and Heating Co., Sault Ste. Marie, Ont. run an advertisement in the local papers as shown on this page, pointing out that the cause for a usual public complaint can be eliminated by taking advantage of the service they have to offer. Incidentally it gives this concern an opportunity to develop business which would otherwise be missed.

Discussing this subject with Sanitary Engineer, C. F. Hitch, proprietor of this business stated:—

"The complaint of high charges for small jobs, and the ridicule in which the trade was held on account of having to go back for tools, etc., caused me to adopt a plan which I find both satisfactory and profitable.

"First, I converted my truck into a travelling workshop, carrying a fixed vise and full kit of repair tools, stocks and dies, soldering outfit, etc. Then a cabinet containing an assortment of fittings, toilet repair parts, etc. A small pipe rack fitted to the side contains a small quantity of $\frac{1}{2}$ and $\frac{3}{4}$ pipe sufficient for connecting ranges, etc. A plunger and sewer rods complete the outfit.

"I then arrange the same way as one would deliver groceries, viz:—take them

as close together as possible preventing long jumps from one end of the city to another. In this way I can have, say, three taps repaired per hour, where under the old system it took a man an hour to do one. In this way the customer pays $\frac{1}{3}$ of the time paid previously. Volume of business of course is a big factor, but I find no difficulty in this, as the people seem to realize I am trying to give service.

"I am beginning to think there is something in the system, as my jobbing business is increasing every month. It should not be forgotten under this plan

to figure upkeep of car in overhead expenses."

The way in which the plan works out is demonstrated in the statement on this page.

Note.—The charge for repairs to a tap under the new plan works out to 70c. It will be seen that there is no difficulty in getting 75c making profit on one man per hour, 90c.

IMPROVE FREDERICTON WATER SUPPLY

Fredericton, N. B.—Definite proposals for improving the city's water supply for fire protection purposes were made to the city council in a report made by Alderman W. L. Jennings, chairman of the water committee. The necessity for increased pumping capacity and the advisability of erecting a reservoir tank of not less than one million gallons capacity on the hill at the back of the city were emphasized and upon suggestion of the water committee a special committee composed of the members of the water committee with Mayor Reid and Alderman G. H. Clark, chairman of the finance committee, were appointed to make a thorough investigation and were authorized to report at the August meeting.

How Profit Per Hour Increased Under This Plan

	Cost	Charge
Previous cost for one hour—		
1 washer05	.10
Service90	1.25
	.95	1.35
Profit per hour—40 cents.		
Cost under new plan per hour—		
First job—1 washer05	.10
Service30	.60
Second job—1 washer05	.10
Service30	.60
Third job—1 washer05	.10
Service30	.60
	1.05	2.10

Deducting 30 cents per hour for car leaves profit per hour of 75 cents

Heating and Ventilating Department

Details of Hot Water Heating by Forced Circulation

Advantages Include Variation on Short Notice Due to Weather Conditions—To Obtain Pipe Sizes—Expansion Tanks

Written by W. B. TROTTER, A.M.I.C.E.

THERE are several advantages claimed for the forced hot water system of heating, the first is, that the temperature of the heating surfaces in the building or buildings is at all times under the direct control of the operator and can be varied over a wide range at short notice so that weather conditions can be accurately provided for. If for instance, a chinook springs up all that is necessary is to stop the pump in addition to shutting down the source of the heat, and no excess of heat will be thrown into the building to be dissipated by means of open windows or otherwise. Secondly, a wider range of radiator temperatures is possible than with steam systems; also that no specialties are required, no thermostat, traps, modulation or temperature control apparatus etc., so that the upkeep is low.

Owing to the small sized piping required the cost of the pipe work is moderate, whereas fairly high temperature can be carried in the radiators if required; on excessively cold days radiation need not be figured for more than average cold conditions.

Types of Systems

While the system may be divided into two parts the trunk distributing mains and the buildings, there are two distinct systems that can be utilized in both cases: the circuit system and the two pipe system; either system may be open or closed. If the buildings are heated from a central plant and are strung out in a line the two pipe system would be indicated, but if they were placed so that a loop could conveniently handle them all, then the circuit system would be the most economical. In a two pipe system the mains are reduced as the connections are taken off, while in the circuit system, one pipe only is used, and both supply and return connection are taken off this pipe, which is full size throughout. The supply on a loop system is usually run from the top and the return into the side of the same pipe. Installation costs are less with the circuit system, also frictional losses are lower.

In the individual buildings a circuit system will often be found the most economical to lay out; in this case the

risers and ground floor radiators are usually taken off the main separately, in all cases long sweep bends are used.

Two Pipe Work

Two pipe work can be laid out according to usual gravity practice, but with pipe sizes as given later and if possible a two pipe job should be on the balanced principle so as to give approximately the same drop in pressure between any parts of the system so that no further balancing will be necessary. An overhead system with one pipe drop risers makes a very economical lay out.

It must be remembered that an additional advantage of forced hot water is that grades are of no importance but of course a job graded as is usual in gravity practice will run longer with the pump stopped than a job in which there are numerous rises and dips.

As the temperature of the radiators is usually controlled to suit weather conditions as previously mentioned it is not thought necessary to control each individual radiator with a hand valve, but they are often connected in batteries of three with one valve to the battery, making a saving in the cost of riser connections. The connecting piping between individual radiators should be the full size of the tapping 2 inch. If individual radiators should need control on a loop this can be done as indicated. In two pipe work, if a number of radiators are likely to be shut off at any one time, and so increase the back pressure on the pump, a shunt is provided for as shown. In a circuit or a two pipe system, radiators can be connected below the mains if required and will circulate perfectly. If a large circuit is taken off a one pipe main cir-

cuit, a shunt should be provided to balance the pressure.

To obtain pipe sizes it is necessary to know the amount of water that will be pumped, and this will vary. Usually from 6 to 10 lbs. per sq. ft. of radiation per hour is sufficient, as an average say one U. S. gallon per sq. ft. per hour. As pump capacities are cataloged in U. S. gallons, this is a convenient figure. Where valves are provided in all branches and are carefully regulated the lower figure would be safe while other jobs may run as high as 14 lbs. Of course the temperature drop has to be considered. If less water is pumped the temperature drop will be greater; for instance: assume efficiency of radiator 180 B. T. U. per sq. foot per hour, dividing by 8 1-3 lbs. of water per sq. foot per hour will give a temperature drop of 21.5 deg., which is reasonable.

Velocity

In trunk mains assume 8 to 10 feet per second, circuit mains can be loaded up to 12 feet per second if necessary, smaller pipes in the building say 5 feet per second.

The following is safe:—

4 in. pipe	300 ft. per min.
5 in. pipe	350 ft. per min.
6 in. pipe	400 ft. per min.
8 in. pipe	500 ft. per min.

Then the quantity being known, area of pipe in sq. ft. equals:—

Wt. of water in lbs. per hour

$$V. F. P. M. \times 60 \times 60.3 \\ 60.3 \text{ equals density at } 180 \text{ deg.}$$

In a distributing system the branches to the different buildings from the trunk mains can be smaller than the mains in the building.

1½ in. pipe will carry	2,000 ft.
2 in. pipe will carry	4,500 ft.
2½ in. pipe will carry	6,000 ft.

but mains in building itself will be the usual size.

After laying out the system the pipe sizes can be fixed tentatively from the following tables and then can be checked for frictional resistance. If the frictional resistance is too high larger pipes are indicated:

Sizes	One Pipe	Two Pipes
½	0	45
¾	25	100
1	100	225
1¼	350	450
1½	500	660
2	1,000	1,300
2½	4,000	2,500
3	6,000	3,850
4	12,000	8,400
5	20,000	15,000
6	30,000	23,000
8	45,000	30,000

APPRECIATES IMPROVEMENT

Editor, Sanitary Engineer,

"I certainly appreciate the many improvements which have been made in your paper and look forward to receiving each issue.

"Tom P. Baylis, Moose Jaw, Sask."

Friction when the quantity of water is known and sizes of pipe friction loss per 100 feet pipe:

$$0.33 \times V 1.86 \text{ (in ft. per sec.)}$$

$$10 \times D 1.25 \text{ (in feet)}$$

Valves on mains should be O. S & Y so that the control is indicated at a glance. Radiator valves can be any good valve with a good packing nut.

Branches should be valved perfectly with lock and shield type gate valve where likely to be tampered with.

The end of mains should be vented to the expansion tank where possible; this saves time filling the system.

Heating

Figure size of heater from gallons pumped as before and estimate a temperature drop on a large central station of 30 deg., but 20 deg. is ample for ordinary conditions.

Means

1.—Direct heat of boiler. If this is used boiler should be cast iron type.

2.—Waste heat from boiler, viz., economiser, but this apparatus is expensive in upkeep.

3.—Exhaust or line steam heaters; frequently one of each; two means of heating should always be provided. One pound exhaust steam should heat 28 water, 180 feet radiation per boiler horse power.

Heater

Heater should be vertical or horizontal 2 or 4 pass type.

Control

Air controlled thermostat dial type, or expanding liquid thermostat.

Gauges

On supply and return.

Thermometers

On supply and return—30—260. Also thermometer for outside temperature and possibly a wind anemometer.

Pumps

Figure frictional losses carefully;

APPRECIATES SANITARY ENGINEER

Editor, Sanitary Engineer,

"I certainly appreciate your paper and all your articles dealing with trade matters. I like to read about our friends in the trade. I also like to read your Trade Extension articles.

"Fred McPherson,
"North Battleford, Sask."

feet head loss per 100 feet of pipe equals:—

$$0.32 V 1.86 \text{ (ft. per sec.)}$$

$$10 D 1.25 \text{ (in feet)}$$

as before, but tables are available for frictional losses in all sizes of pipe carrying different capacities.

Type:—Horizontal split case single stage pump, turbine or motor driven. For capacity and head as calculated, average efficiency 70 per cent.

Expansion Tank

Radiation will carry $1\frac{1}{2}$ pints of water per sq. ft. Double this, and to this allow for mains and add trunk mains to arrive at the amount of water in the system. Capacity of tank should be 2 to 5 per cent. of the total water in the system. Tank can be closed pneumatic type in engine rooms, or open type in attic or building. The tank should be fitted with an automatic water feeder and a gauge glass.

Temperature

Closed system 240 deg. F. is maximum. Open system 210 deg. F. is maximum.

Design of piping should provide for expansion and contraction due to high temperatures used. Hangers to hold weight of water and pipe. Use long sweep pipe bends at all changes of direction of mains.

air content of which is about 20 per cent. relative humidity. Nature average considerably above 60 per cent. rarely as low as 30 per cent in a dry desert. 35 to 40 per cent. is a healthful indoor humidity for cold weather. It is quite impracticable to obtain any higher humidity with artificial heating systems. That can be done only by special apparatus."

It is, indeed, pleasing to know that the "special apparatus" to which the doctor refers can be installed in warm air heaters. However, judging from his opinion concerning the healthfulness of 35 to 40 per cent. in the relative humidity for cold weather the average water pan then is not far from the mark of providing properly humidified air, warmed to a comfortable degree. Other systems of heating have no practical means of humidifying the air. In fact, they have nothing to do with the air circulation. Effusing heat as they do with no contrivance for replacing the moisture which they dry up, it can be seen why houses not utilizing warm air heaters illustrate the horror of being drier than a desert. The most significant evidence of man's progress is his control of nature. When he is capable of controlling cold air in winter time and rendering it equally wholesome to breathe as the summer air—illustrated by warm air heaters—is not his progressiveness increasing?

QUESTIONS & ANSWERS

COVERING HOT WATER BOILER WITH ASBESTOS

Editor, Sanitary Engineer:

Please tell me the best way to cover up a hot water boiler with asbestos, showing way to go about it and telling me what material go in it.

—A. B., Lachine, Que.

Answer:—If it is a hot water heating boiler, in most cases they are covered with standard asbestos cement (boiler covering) which is supplied in powder form, put up in 100 lb., bags. One bag will cover approximately 15 sq. ft. $1\frac{1}{2}$ in. thick. It is mixed with water to the consistency of mortar and applied to the boiler, when warm, in layers $\frac{1}{2}$ in. thick. Each coat or layer to be dry before applying the next, and over each coat apply either ordinary bale wire or chicken netting to give it a key. If a hard finish is desired, a small portion of Portland cement can be mixed with the asbestos for the last coat, and troweled to a smooth, hard finish. This application is also used sometimes for the covering of hot water tanks for domestic purposes, but an asbestos removable tank cover 1 in. thick, canvas jacketed, and made to fit exactly the tank is now being turned out. Prices are as follows:

18 gal. tank cover	\$6.00	net each
24 gal. do	6.25	do
30 gal. do	7.00	do
40 gal. do	8.50	do
50 gal. do	9.00	do

The above prices are for standard hot water tanks.

Says Sufficient Moisture in Air Reduces Need for High Temperature

Prominent Doctor Discusses Value of Moisture in Air

IT IS significant to note that doctors of medicine lay great stress on the need for humidity. The necessity of vapor in the air to insure the normal existence of human beings is not denied by anyone. But living away from the original state in which we existed in primitive times, humidifying the air becomes as much a problem—if the proper functioning of the bodily organs is to be considered—as heating. Also, by adequately supplying houses with moisture the percentage of heat required to keep the inhabitants comfortable during the winter time is materially lessened.

In an interesting article a prominent doctor writes concerning humidity:

"Healthful humidity is practical by natural methods of producing water vapor at 65 deg. and further; it is a fact that with humidity at 35 per cent. to 40 per cent., a temperature of 65 deg. is quite as comfortable as 70 deg. with humidity of 20 per cent. relative, such as usually obtains. (At 75 deg. the average humidity is considerably lower than 20 per cent.) To maintain 40 per cent. relative humidity at 70 deg. requires twice the amount of water vapor added artificially that is required at 60 deg. and outside humidity 60 per cent. relative."

Further expressing his views on humidity and its absolute necessity to healthful living, he says: "We live in houses the

Sewage Disposal for Rural Homes

Pollution of a Water Supply a Serious Matter—Questions Asked and Answered—Problems Unlimited—A Wide Experience or Close Study Necessary to Overcome Conditions in Rural Districts

Written specially for Sanitary Engineer by EDWIN NEWSOME, Sanitary and Heating Engineer, Lecturer on Rural Sanitation, Ontario Dept. of Agriculture.

Installation Showing How A Sewage Disposal Bed Should Be Laid On Sloped & Level Ground.

How The Pollution Of Water In A Nearby Well Is Prevented.

This House Is Situated Near To Boundary Line Of Lot Therefore All The Disposal Field Tile Pipe Had To Be Laid In One Direction The Area Available Is Somewhat Limited Which Makes It Necessary To Utilize The Sloped As Well As The Level Ground C. Is A Small Distributing Tank.

THE experience gained by traveling through the country is, to the average student or engineer, almost invaluable. Backed by previous practical experience, makes it possible to be of much assistance to one's fellow-man. The question put to one to solve, and the conditions to be found all over the province also assists one to enlarge on one's experience.

Problems Solved

The accompanying illustration shows how a septic tank is being installed, and how the polluting of the water in the well is prevented. Let it be strictly and clearly understood that to sell a farmer such an installation cannot always be done as easily as one would like. But as the writer is not selling a thing, and is giving out advice free to all comers, the person to whom the advice is given is easier convinced of the need for such an installation, than if one were interested in selling goods.

For example, a person specifying that a job be done as in the manner described, and that person is selling the goods needed, is at once looked upon as being interested in selling the goods and doing

the job, and therefore there is at once a selfish motive in mind by the person inquiring about such a job. It is all a matter of education, and that is one reason why these articles are written.

Suppose for instance that the reader were to take more note of these installations, show the prospective customer this very article and let him examine the illustration, it would go a long way towards convincing him that such a job would be O. K.

The writer has himself frequently to show his hearers actual quotations from books written by men whose character cannot be questioned, and in that way can convince sometimes the most skeptical.

Now let us turn to the illustration. Here is found a house, a septic tank near the house, a well, a small level area and one with considerable slope. The person requiring the advice explained the situation as follows: said he, "Our house is located near to a party driveway, the well is not far from the driveway or the house and the bathroom is situated in the corner next to the driveway as shown. How can I get a septic tank built, and how must the field tile

pipe be laid so as not to pollute the well."

Use Cast Iron Soil Pipe for Part of Main Drain

By building the septic tank as shown in the plan, placing the fittings in the position described, and by using cast iron soil pipe fittings from points A to B, caulking and lead pouring every joint, there can be no danger of polluting the water in the well.

A still further precaution must be taken by building the septic tank of super-cement, which is absolutely water-proof. Also building a super-cement casing around the well as shown in the elevation plan.

The cast iron pipe must have a fall if possible of about 6 inches in ten feet and inserted into the hub of a 4 inch glazed tile sewer pipe branch so that a few lines of laterals can be laid before the main distributing pipe enters the small distributing tank.

By noting the enlarged view of the small distributing tank, it will be seen that there is a glazed tile bend entering it at the left with the bend turned up

(Continued on page 16)

Plumber Gets Valuable Prospect List

Thoroughly Practical and Effective Method of Getting Information on Which Sales Can Later be Built—Offers Prizes

ONE of the very cleverest ideas that has been suggested to T.E.B. in a long time, suggests a thoroughly practical and effective method of getting priceless information on which sales can later be built.

Just as is usual with the greater number of practical and effective ideas, this one is simplicity itself. Here's the way it works:

Try This Contest

Advertise it as a prize contest. Offer first, second and third prizes to the householders having in use the oldest set of bathroom fixtures in your town or territory.

Make each contestant put their bid for one of the prizes into the shape of a detailed description of the old bathroom outfit which is in use. Call for this detailed description to not only describe the fixtures, but also give exact or, at least, approximate dates when they were installed.

Require each contestant to also give the name of the person who owns the property, and who would naturally be

the one to whom new equipment might be sold.

According to locality and the possibilities of return, the first prize in such a contest could be anything from a complete outfit of three bathroom fixtures, down. Or, the first prize might be a high grade, built-in tub with trimmings, the second prize a pedestal lavatory and medicine cabinet, etc., and the third prize a good water closet combination. In connection with this, make it plain that the prizes are the fixtures only, and "no" legitimate charges will be made for installing them; also that they will only be given and installed in the property described by the contestant.

This matter of deciding what to give as prizes will, of course, have to be regulated by the judgment of the individual plumbing dealer, in connection with his own contest and his own locality.

Arrange for a committee of judges of not less than three, composed of prominent people who will be absolutely impartial. Make it a condition of judgment on contestants that completeness of information and description, as well

as age of the outfit described, will be considered in making the awards.

A contest of this character would be productive of immensely valuable information. In the first place it would give exact information concerning large numbers of dwellings in which there would be real prospects of selling new bathroom fixtures. In the second place this information would come direct from the people themselves, and therefore be more than usually accurate. In the third place the very fact that they entered the contest would be proof that they would like to have new fixtures. It would only remain for intelligent use to be made of this information in order to sooner or later sell a considerable amount in new bathroom fixtures.

The same idea could easily enough be converted to suit the need of a heating contractor. Simply make it a contest for the oldest heating equipment.

Just stop and think what a live mailing list a contest of this kind would give you as a start for sending out sales letters and advertising literature on modern up-to-date bathrooms or heating installations!

Two suggested window displays for plumbers for the mid-summer months of July and August. The underlying idea is "keep cool." On the left, some borrowed furniture gives a view of a lady's boudoir in which the pedestal lavatory and mirror appear as regular equipment, being the "lavatory bedroom fixture." On the right, a ventilating fan is shown, a gas range for cool cooking, and a handy sink with special faucet for dish-washing. Borrowing the few lines needed for these windows enables the plumber to make a window which will stop and interest many passers-by.

Tinsmithing and Sheet Metal Work

Layout of Spiral Conveyor and How to Know Where Bottom Requires Hammering to Remove Twist

Working Drawing and Description Answers Above Question, Recommends First Drawing a Half Plan

Written for Sanitary Engineer by O. W. KOTHE, Principal St. Louis Technical Institute

A CORRESPONDENT asks about the layout for a spiral conveyor, and in particular how to know where the bottom requires hammering, in order to remove the twist which develops in the spiral revolution.

To set out the layout for the conveyor, first draw a half plan, making the stand pipe or shaft 1-13 inch in diameter and the conveyor, which spirals around it, has an external diameter of 2-14. Strike these two semi-circles and divide the outer semi-circle in equal parts. Draw lines to the center and this also divides the inner semi-circle. Now draw a line, as H-T, to equal one-half revolution of conveyor spiral. In this case it is made equal to the great diameter, 2-14, and is set as H-T. Divide this distance in the same number of equal parts as planned. In practice the elevation of spiral is not necessary to develop, since only the heights of one space is desired as h-t for getting the two lengths. But to construct the spiral square over horizontal lines, from each point in line H-T and then erect lines from each point in both semi-circles of plan. Pick out the intersections and sketch a uniform line through these points, and that gives the spiral as shown.

Now observe this spiral raises one space in elevation between each two points in plan. In other words, in the distance 2-4 of plan, we raise equal to the space h-t. In the same way in the space 1-3 of plan, we raise an equal distance h-t. So we pick these spaces as 2-4 and 1-3 and set them as t-4; t-3 in true lengths. Draw lines to point "h" and you have the true girth along the edges of spiral. Now the lines 1-2, 3-4, 5-6, etc., of the plan are true lengths, as they are true horizontal distances and have no inclination. But the dotted line 2-3 of plan raises equal to one space. So we pick this line and set as t-3' and line 3'-h is the true length. To set out the pattern for spiral line on post or stand pipe, observe from the half pattern, a straight line is developed, and the girth between points is the same as h-3. But for the pattern of the bottom draw a

line as 1-2 equal to 1-2 of plan. Then pick girth space h-3 and from 1 in pattern strike arcs as at 3-3. In the same way pick girth space h-4 and from 2 in pattern strike arcs as at 4-4. Then with true lengths h-3' and 2 in pattern as center, cross arcs in point 3-3. Next pick line 1-2 from plan and, using 3 in pattern as center, cross arcs in point 4.

This development is continued, laying out the gore pieces to about two to three feet in length, because that is about all that can be handled in shaping up for assembling, as there is a twist developed in this pattern a similar as shown by the sketch W in the full position. Now for this to fit in a horizontal position,

the corners b and c must be hammered to take on the shape of the dotted position. The throat as at "a" also requires some hammering to shape the bottom uniformly. Just how much and where the workman must apply the hammer is a matter that experience alone can dictate. Possibly a coppersmith is more apt at this hammering than the average sheet metal worker, because it is his business to know where and how to hit the metal, in order to shape it.

The outer band is merely a straight strip of metal, as at N, with girth spaces set off equal to h-4 to take in the full length of the sheet. Then the miter ends are cut on, developing them as at M. The lower base cut is for the bottom and the upper cut is for a vertical splice if one is needed. Otherwise just straight cross laps are sufficient and enough strips are filled in to make the band continuous from bottom to top.

SEWAGE DISPOSAL

(Continued from page 14)

This bend if too long should be cut short so as to permit only two inches of effluent to be held back. This bend is necessary so that sufficient effluent re-

Working Drawing Shows Plan for Layout of Spiral Conveyor

mains in the laterals, and to ensure that they are full to their capacity, after which the remainder of effluent will overflow into the distributing chamber and on down to the main pipes and on into the rest of the open-jointed laterals. The distributing tank also takes the place of a bend as it were and takes a little of the pressure from the flushing of the syphon.

Main Pipes Must Follow Contour of the Ground

As soon as the effluent begins to flow into the small distributing tank, it flows on down to the first bend, fills up the third line of open-jointed field tile pipes, up to the branch on the side of the glazed pipe and down to the fourth line of laterals, and repeats the same operation until all these laterals laid on the slope have received their full charge of effluent. Then, if more field tile is necessary to take all the discharge from the syphon or dosing chamber of the septic tank, it will be quite in order to lay more laterals on the level in the same manner as is usually adopted in ordinary level installations.

It is very necessary to lay as many pipes as will take the total contents of the dosing chamber every time the syphon operates. Furthermore, where such a condition as this has to be overcome, it is best not to have the laterals too long, but rather install more lines and shorter ones on the sloped ground. All laterals must, under every condition, be laid perfectly level.

In this particular job, eight persons are occupying the house, so that two hundred and sixteen gallons of sewage must be provided for, meaning that 432 linear feet of four inch pipe is needed to take the whole discharge.

Protect Pump Piping

When such an installation is being made the piping from the well must be given some attention, as well as other service pipes that have to be laid in the ground. It has been found that the best known practice is to make a V shaped trough using one inch lumber well tarred with pitch or asphaltum, and lay the wrought iron or steel pipes in the trough, covering the same also with pitch or tar, etc. This will protect the piping.

Many times such pipes have to be laid in the ground below the frost, but, as the ground has been disturbed, moisture has been known to have seeped down to the pipes and rapid corrosion has taken place, a condition that can result in some of the sewage finding its way with the water supply, making it unfit for either cattle or human consumption.

In spite of the fact that volumes have been written regarding the question of freezing of the laterals, there are still a great number of sanitary engineers as laymen who will insist upon laying the laterals too low down in the ground.

B.C. PLUMBER FINDS PAPER OF GREAT VALUE

"I certainly think the department of Trade Extension is an excellent one and hope to see more of it. I find the technical articles of great value, as one can always pick up some new idea in them. The articles on advertising and office work I find very helpful."

Harvey Brown,
Armstrong, B.C.

The question of climatic conditions is referred to, and where the temperature drops down to a very low degree, the argument that the contents are bound to freeze is maintained. But, as a matter of fact, while it almost appears to be a contradiction, the contents are very likely to freeze if laid too low, for the simple reason that the lower such pipes are laid, the fewer aerobic germs are to be found, and such being the case, the sewage will freeze. On the other hand, seeing that the ground near the surface fairly teems with bacteria, they prevent the freezing of the sewage, no matter how low the temperature is liable to drop.

(To be continued)

STARTLING NEED FOR SANITATION IN SASKATOON

A somewhat startling condition of affairs has been brought to light in Saskatoon, where a report of Medical Health Officer Arthur Wilson shows that of 3,252 houses in the city, fifty five per cent. have no modern convenience whatever, while twenty-two per cent. are not even connected for water and sewer, and it is to this deplorable condition of affairs, coupled with overcrowding in the houses, that the medical health officer attributes the alarming number of cases of typhoid fever which have been recorded during the past ten years.

The report, in part reads:

"It has been estimated that out of a total number of residences or homes in the city 45.4 per cent. are small and necessitate intimate contact—in very many cases, overcrowding of the occupants. To treat infectious diseases in such houses where the little children are in intimate contact, is not safe, because if you get one case you are almost certain to get others.

"In addition to this the number of houses on sewer and water that are not connected is very large in this city. The total number of houses was 3,252. The number connected was 2,542. 710, or 22 per cent. are not connected. 55 per cent. of the total houses in the city have no modern convenience. The number of houses on last year's extension was 60 and only 19, or about one-third, connected with the sewer and water.

A Chance for Ambitious Tinsmiths

The last word in modern art is that of a gabo, a Russian "artist," who calls his work executed in sheet metal "Constructionist" intermetalation. He has been holding a show in Berlin.

When the Old Channel Goes Dry

OFFICIAL figures on price movements indicate that plumbing supplies are either stationary or gradually increasing in price while farm products are showing further decline. Thus the spread between the two is increasing. Plumbers in rural districts have been having some difficulty talking plumbing and heating equipment to farmers under such conditions, but many of them with considerable success. It appears that in dealing with this type of customer similar aggressive measures will have to be continued.

In analyzing the field it is interesting to note the change which is taking place. In water systems for instance it is evident that the business is going more largely to towns and suburban districts of cities than to the farms. Many plumbers are working up a good business in such districts, realizing that the broad extension of electric power opens up greater possibilities for the sale of this and other such equipment. It is but another indication of the opportunities there are for developing business in new fields when the old channels go dry for some reason or other. More plumbers with resourcefulness to see these opportunities would make things better for the whole industry.

Where Care is Needed

A WELL established plumbing contractor recently made the statement to *Sanitary Engineer* that he could not tender successfully on installations in new houses because of the cut price competition of the transient type of operator. This class of competition has been increasing lately, and there are some aspects of the situation resulting therefrom to which others in the industry should give attention. For instance the risk which wholesalers and manufacturers take in selling to operators whose business methods are against all the established rules and policies of well established businesses, must be reflected on the whole industry to some extent. Bad debt losses certainly add to the general overhead of these branches of the trade.

Much of the mortality among businesses is due to carelessness in granting credit and in this connection contractors would be well advised to take a tip from the plan followed by the credit man employed by the jobber and manufacturer. These men do not waste much time getting after the contractor when they think necessary. He may not do as big a volume as he would by being careless, but what is volume if he has to charge off big losses every year through bad debts?

The present period of prosperity has brought with it its customary quota of questionable customers. But, regardless of unusual conditions, the matter of credits is fundamental. The longest chance the contractor takes is getting his money.

The condition is brought about largely by keen competi-

tion, and the slow payer and the deadbeat are not lax in taking advantage of the situation. They know that if one contractor doesn't take their business another will, so it becomes a process of elimination.

Exchange of credit information is very desirable among business men in a community, and to-day it is being worked with success in many large cities through the local association. It can be handled with success in any town or city, regardless of size, and become a big factor in progressive association work. Done collectively, it is an effective means of shortening the long chance.

Will Bring Improvement

THE success or otherwise of plumbing business in many parts of Canada is very closely associated with conditions in the agricultural sections. For this reason farm conditions are being watched very carefully just now. Those in close touch with the situation are of the opinion that there is every likelihood of a bumper crop in Canada this year with indications of better prices than last year. This is expected to bring a greater measure of prosperity in rural sections than has prevailed for some years, the good crop of last year enabling farmers to merely clear off a part of indebtedness and leaving them still unable to exert their full buying power.

Sanitary Engineer has secured an official report on crop conditions throughout Canada, summarized as follows: Manitoba—Crop late but healthy and vigorous, growing satisfactorily. Alberta—Crop uniformly good over entire province. B. C.—Small fruits crop largest on record. Grain crops in excellent condition. Root crops promise well. Ontario—Conditions generally favorable. Saskatchewan—Everything in ideal condition. Nova Scotia—Crops growing rapidly with promise of good yields. In New Brunswick and Prince Edward Island, the season is late and conditions to date just fair. It will be seen, however, that in most provinces of Canada including all those with large areas, that there is good ground for expecting a bumper crop. In expectation of this plumbers in many parts of the country are reported by wholesalers to be increasing their bookings of fall and winter goods. The realization of the expected crop will help to improve conditions throughout the whole industry of Canada.

FEW THINGS there are that escape sales tax, and with the increase in the percentage of this tax it will likely be made more inexorable than heretofore. In the dying moments of the last House of Commons session, a question was asked by one member. He found that sales tax was applying to the purchase of the Union Jack and asked if this was in accordance with the views of the House. The Minister of Finance, with his usual wizardry in finding ways and means of revenue production, answered that the taxing of the Union Jack was a symbol of the enforcement of the laws of the country. At any rate merchants think there is less to cheer for under the new regulations and as result there may be less "flag-waving."

AN IMPORTANT angle to business success is the need of going after collections. There are millions of dollars on the contractors' books that could be collected if they would go after it systematically. These accounts are good but it takes a certain degree of persistency to get them to "come across." Every effort must be made by letter, telephone or in person. Oft times you hear the contractor say—and this is particularly true in the small town—"I don't like to offend them, because I need their business." But what good is their business if they don't pay their bills?

MINUTE MESSAGE

Management Series

Plenty of Feed—But Looking at It Doesn't Make Him Fat

THERE'S many a "starved" merchant with plenty of sales going through his store. Starved because there are no profits.

Sales and profits are not always found together.

You never find profits without sales but you do find sales without profits. Quite often, too, sales go hand in hand with losses.

Low prices will sell goods, there's no argument there, but—

What's a sale without a profit?

It will take more than low prices to make a business return a profit that fattens the purse of the owner.

Put a bottom in the "manger." Call it management.

THINK IT OVER--APPLY IT TO YOUR BUSINESS

Keep Mid-Summer

Alive With The **RUUD 95**

SELL the great untouched, unsold small home market with the Ruud 85 and 95, the new super-quality automatic water heaters.

Let these two units lead your attack for mid-summer business.

The small home owner takes no extended summer vacations; he can be seen; he can be sold.

The Ruud 95 Work Plan tells how to sell him—tells how he has been sold by others.

It shows how your automatic water heater sales can keep pace with the thermometer's rise—how to substitute profit for the usual mid-summer sales depression.

A simple plan, easily followed—a sales producer, proved in actual tests—write for it.

Simply write "No. 95 Work Plan" on your letterhead and send it to us.

Ruud Manufacturing Company

**474 Bathurst Street,
Toronto, Ontario**

News Notes From Coast to Coast

BUSINESS CHANGES

Montreal.—Stewart & Clarke, plumbers, have dissolved partnership.

Montreal.—Debien & Berthiaume, plumbers, have dissolved partnership.

TAKES NEW PREMISES

Goderich, Ont.—John Baker, plumber and tinsmith, has leased new premises.

Amherst, N.S.—R. G. Jenkins, local tinsmith, has returned from his honeymoon and intends transferring his tinsmith business to River Hebert as soon as he gets his building completed.

EXTENDS BUSINESS

Orillia, Ont.—B. H. Mariner, plumber, has added a hardware stock.

APPLIES FOR PLUMBING SHOP

G. Hamilton, Toronto, has applied for an amendment to Residential By-law to permit of plumbing shop in basement, 1308 Lansdowne Avenue.

MOVE INTO LARGER QUARTERS

The Chamberlain Desolvo Co. Ltd. has moved from its old offices at 35 Richmond Street to its new quarters at 30 Church Street, Toronto.

OBITUARY

Harold A. Lounds, aged 51 years, well-known Halifax plumber, passed away at the Morris Street Tuberculosis Hospital, Halifax. He was predeceased by his wife some years ago and is survived by one son, Harold F. Lounds, who resides in Halifax.

INCORPORATION

J. L. Buchanan, Ltd., head office, Toronto, capital \$100,000, to deal in plumbing supplies.

Dominion Radiator and Boiler Company Ltd., head office Toronto, capital \$3,500,000 to manufacture and deal in all appliances for changing temperatures including boiler furnaces, stoves, grates, pipes, refrigerators, vacuum cleaning machinery, etc.

CANADIAN INCORPORATIONS

Stratheona Potteries Ltd., incorporated with head office in Montreal, and capital of \$1,000,000, to manufacture all kinds of potteries, wares and material incidental to the trade of sanitary engineers, including tubes, pipes, sanitary apparatus, etc.

PERSONAL

Chas. E. Morrison, secretary-treasurer James Morrison Brass Co., underwent an operation for appendicitis and is reported to be making good progress toward recovery.

Doings in the Plumbing and Heating Industry

Signal honor comes to Claude E. Burnett, president of the Duro Pump & Mfg. Co., Dayton, Ohio, who has just been elected president of the Dayton Chamber of Commerce. Dayton, a city of 165,000 population, is one of the best advertised and fastest growing cities in the country.

TALK CENTRAL HEATING

Strathroy, Ont.—Strathroy business men are talking up a big steam heating plant to heat the stores and business places of Front and Frank streets, and thus lessen the cost of heating to the patrons.

TRUCK WITH PLUMBING WARE GOES THROUGH BRIDGE

A large 5-ton truck loaded with plumbing ware from Port Hope Sanitary Mfg. Co., crashed through a bridge near Whitby, precipitating the truck and its load into six feet of water. The load was salvaged.

GAS CONVENTION IN AUGUST

The sixteenth annual convention of the Canadian Gas Association will be held in Ottawa on August 23 and 24. Headquarters will be made at the Chateau Laurier, and the various officers are doing their utmost to make the meeting a great success. Papers will be read of interest to all branches of the gas industry.

LARGE SHIPMENT OF FURNACES

St. Thomas, Ont.—L. Udell, heating contractor and distributor of furnaces, received this week a carload of 24 all-cast furnaces. In the shipment to St. Thomas, the castings of the 24 furnaces weighed fourteen tons. Mr. Udell is now busy placing the furnaces and reports a busy time.

SANITARY ENGINEER POINTS TO REMEDY

Kitchener, Ont.—That copies of the report stating the findings of A. W. Berry, the sanitary engineer who investigated the cause of the pollution at Schneider's Creek on June 14, be forwarded to the management of the factories whose waste products have contaminated the creek, was decided at the monthly meeting of the board of health. It is expected that the firms concerned will adopt the suggestions of the engineer as to means in which the nuisance can be eliminated. A recommendation to the city council that the creek be cleaned out was also passed.

PLUMBERS ASK FOR CONFERENCE

Halifax, N.S.—The journeyman plumbers asked employers for a conference in connection with a working agreement for this year.

TENDERS WANTED

Quebec.—Tenders are being called by the Department of Public Works, Ottawa, for the plumbing and the heating and electric lighting systems of a toilet building at the Champlain Dry Dock, Harbor of Quebec, Que.

CONTRACTS AWARDED

Windsor.—The plumbing installation in the new Windsor-Walkerville technical school has been completed. Two hundred and twenty-five radiators make up the heating system for the large building, being supplied by a forced hot water system. The equipment was supplied by the Gurney Foundry Co., Toronto, installation being made by W. J. McGuire, Toronto, at a tender of \$36,000.

CONTRACT AWARDED

Welland.—C. R. Hagen, heating and plumbing engineer, has been awarded the heating contract for the new plant of the Welland Cotton Mills. The system will be the most modern installed in this district, embodying all the latest improvements in steam heating. This firm also has contracts for the plumbing and drainage in the Welland Cotton Mills and the Welland Packing Company and for the metal work on the new market building now under construction.

PREPARES PLAN OF SLUDGE DRYING BED

City Engineer, F. G. Ure, of Woodstock, Ontario, has placed before the city council of that municipality a plan for the preparing of a drying bed to receive the sludge from the sewage disposal plant in the west end of the city. At present much annoyance is caused residents of the district by the odors of the sludge deposited on the flats and near the city's gravel pits.

WATER FOR 200 HOMES SOON

Port Credit, Ont.—Applications for the installation of water services are pouring into Town Clerk Gordon's office, and already there are over 100 houses on the list to be supplied. The applications are coming in steadily, two and three each day, and it is expected that by the time the water is turned on 200 homes will be on the system. Already the filters have been tested.

Gangs of workmen are being kept busy putting the services into the houses.

PORT CREDIT SYSTEM COMPLETE

Port Credit, Ont.—Port Credit water system is almost completed, and workmen are busy doing the finishing jobs. It is expected that the pipes and the tanks will be tested this week, and if found satisfactory the official turning on of the water will be held next week. The system was installed at an estimated cost of \$110,000.

PLUMBERS TEAM IN DRAW

Windsor, Ont.—After entering the fifth frame with a five run lead and the old ball game practically tucked away in the bat bag, Eddie Nantau, twirling for the Plumbers, blew up like a kite and his support promptly followed, the champion Kelsey-Wheel aggregation chasing over five runs before the side was retired in the fifth and tying up the last game. The score was 7-7.

WEIRD OBSTRUCTION IS FOUND IN BRANTFORD WATER PIPE

Brantford.—Described by secretary F. W. Frank of the water commission as looking like a dead dog, an interesting obstruction, taken from one of the galleries which feeds the city's pumping station in the Holmedale, now reposes in the office of the commission. A small root, with many rootlets, found a lodging in one of these pipes some time ago, and from that date until taken out of the pipe during the cleaning process now going on, has been collecting, by means of its network of rootlets, a considerable mass of fibrous growth. At the present time it is nearly dried out, but has an area well over a foot square, and is two or three inches thick. The obstruction, when wet, swells up like a sponge, and is capable of blocking a 24-inch pipe.

RECOMMEND ADOPTION OF BIG SEWERAGE SCHEME

Toronto.—City Solicitor Johnston advised the Board of Control that the proposed new drainage and sewage disposal system for North Toronto could not be carried out on the initiative plan, but would have to be put through as a forced local improvement. With that point to guide them, the board next directed attention to the two propositions submitted by Works Commissioner Harris. The first provided for the construction of an entirely new and comprehensive system for the whole district at an estimated cost of \$11,125,525. The other scheme contemplated the utilization of the existing system as constructed by the old municipality of North Toronto, reducing the cost of the new system to \$9,811,170.

After considerable discussion the board decided to recommend to council adoption of the smaller scheme, as it was thought the existing sewers would, in many cases, provide ample accommodation for a number of years.

PLACE COMFORT STATION

Regina.—After the matter being held in abeyance for many months, the city council has taken action in connection with the placing of a public comfort station in the basement of the city hall, and has authorized the city commissioners to secure plans and specifications for the station at an approximate cost of \$8,000.

CHANCES FOR PLUMBING EQUIPMENT

St. John, N. B.—Indications are that a new railroad station will be built in St. John, N. B., by the Canadian National Railways, following the recent visit of officials from headquarters. This will mean a fine plum or plums for some plumbing and heating contracting firm. A new railroad station will also be built in Fredericton, N. B., by the Canadian Pacific Railway.

PLUMBING ACTIVITY IN PETERBORO

Peterboro.—Plumbing activities for Peterboro for the month of June, as set forth in the report of Plumbing Inspector A. G. Methers, are as follows: baths 9, basins 15, water closets 17, sinks 19, laundry tubs 2, dentist's cuspidor 1, floor drains 3, water tests 35, smoke tests 20, layouts 4, miscellaneous inspections 38. There were 41 certificates issued, and during the month 14 outside closets were closed, bringing the total for the year up to 61.

IS SALES MANAGER HAMILTON STOVE & HEATER CO.

Chas. J. Taber has been appointed sales manager of Hamilton Stove & Heater Co., Hamilton, Ont. He has had a wide experience in the heating business, and has travelled through practically all parts of the Dominion. Previous to joining this firm he was employed with some of the largest American manufacturers. He now has full charge of sales of stoves, furnaces, radiation, etc., for Canada.

CHAS. J. TABER.

Appointed sales manager Hamilton Stove & Heater Co.

DAUGHTER OF WELL KNOWN SANITARY ENGINEER SUCCUMBS

Moose Jaw, Sask.—Miss Dorothy Baylis, eldest daughter of Mr. Tom Baylis, sanitary and heating engineer and executive member of the Saskatchewan Provincial Society, D. S. & H. E., died at the home of her parents after suffering about a week from anaemia. Mr. Baylis submitted to two operations for blood transfusion in which a pint of his blood was injected into his daughter's veins on each occasion.

This sudden demise is the more unfortunate as Mr. Baylis had just completed arrangements to take his family on a tour of the British Isles. The family would now have been on their way to England, if this illness had not intervened.

Pipeless Furnaces Have Big Run in St. John

ST. JOHN, N.B., July 12.—Manufacturers have been doing a lot of advertising of pipeless furnaces in local papers in the maritimes and especially in St. John and vicinity. Sanitary Engineer interviewed a large building company, Armstrong & Bruce, Ltd., who are erecting a large number of houses in a residential section of St. John, learning that they were using only the pipeless furnace in their dwellings. R. H. Bruce, of this company, stated that his firm had built five houses during the summer of 1922, and that pipeless furnaces had been installed in all of them. The buyers of the houses were all well satisfied with the heating qualities of the pipeless furnace, and claimed that they were the most economical system of heating that they had ever had experience with. Some of the purchasers stated that they were able to heat their homes at practically the same cost as with a self feeder, but with not half the inconvenience and dirt. Mr. Bruce added that, in view of the great satisfaction expressed by the purchasers of these houses, his company was installing nothing but pipeless furnaces in all of their ten houses now under construction. As well as giving satisfaction to the purchasers, it made possible a lower selling price on the houses. In the course of a few years there will be a large residential locality in St. John with only pipeless furnaces to supply the necessary heat, as it is the intention of this company to carry out their heating policy in all houses constructed by them.

Messrs. Philip Granan, Ltd., a firm located in the north end stated that in 1922 they sold and installed more pipeless furnaces than ever before in the history of the company, and that property owners were even taking out old heating equipment and making the change, as they considered the saving and efficiency more than offset the cost of the alterations.

Twenty Years - Ago -

Following items are reproduced from trade paper files of the MacLean Publishing Co., of July, 1903:

"Now that the fame of the Toronto Master Plumbers' Baseball Team is known, challenges are coming fast, but the worthy secretary, Geo. Clapperton, says he cannot allow his team to play two Saturdays running."

"The annual convention of the National Association of Master Plumbers and Steam Fitters of Canada was held on July 1, presided over by Frank Powers, at Montreal. G. A. Perrier, secretary, was detained through the death of his mother and J. Paseoe Bell acted pro tem.

"Ottawa City Council, which has debated the legality of enacting a municipal by-law governing plumbing trade, have at last framed and passed such a by-law. No vent pipe less than 4 inches in diameter shall pass through the roof, all pipes must extend at least 3 ft. above the roof and be 10 ft. from any opening."

"Resolutions re permanent secretary were referred to W. H. Meredith, R. Ross, J. Lamarche, H. Mahoney and P. C. Ogilvie. Re amendments to Halifax resolutions, to J. McKinley, J. Thibeu, J. D. Chisholm and W. Watson; re obtaining legislation along sanitary lines to H. A. Knox, Geo. Kinsman and L. Le Grow."

"Others present included D. J. Shea, Fredericton; Geo. Ross, Brockville; W. G. Butler, Perth; Geo. A. Wootten, Halifax; F. Maxwell, L. Le Grow, G. Cooper and F. Armstrong, Toronto; H. A. Knox and J. G. Johnstone, Ottawa; Representatives of supply houses included, P. McMichael, manager Dominion Radiator Co., Ltd., Toronto; Geo. F. Clare, of Jas. Robertson Co., Ltd., Toronto; W. N. Forbes, Wm. Stairs, Son & Morrow, Ltd., Halifax."

"The following responded to the roll call: President F. Powers, Lunenburg, N. S.; Past President John McKinley, Ottawa; Vice-President P. C. Ogilvie, Montreal; Treasurer Jos. Lamarche, Montreal; Vice-Presidents—Ontario, W. H. Meredith, Toronto; Quebec, M. Thibeu, Montreal, pro tem; New Brunswick, Wm. Watson, Moncton; Nova Scotia, Geo. Kinsman, Halifax; Cape Breton, J. D. Chisholm, New Glasgow; B. C., H. Mahoney, Guelph; Manitoba, R. Ross, Toronto.

Catalogs and Booklets

Those interested in any of the catalogs described below can procure a copy of the same by writing direct to these firms. Mention that you noticed this in Sanitary Engineer.

WATER SERVICE BOOKLET

The Dayton Pump and Manufacturing Co., of Dayton, Ohio, have sent us a copy of a booklet called "Dependable Water Service." This booklet is very well gotten up in colors and it is intended to be distributed among the trade. They inform us that copies will be supplied from their Dayton office upon request.

FINDS VALUABLE ARTICLES IN "SANITARY ENGINEER."

"We like your journal and find very many valuable articles in it."

Cowans, Brantford, Ont.

THE GURNEY FOUNDRY CO., LTD.

Heating Catalog Section D-23, which takes in their line of pipe and pipeless furnaces. This booklet contains thirty-six pages and is made of a very durable and high-class paper. The illustrations are very clear and aid the descriptive matter greatly. Full descriptions are given of each model; also a complete description of their cold and hot air registers.

DURO WATER SYSTEMS

A new 40-page general dealer catalog on Duro water systems is just off the press, announces The Duro Pump & Manufacturing Co., of Dayton, Ohio. This catalog is bound in imitation leather and contains helpful data and information covering the installation of deep and shallow well water systems under varying conditions. Duro also announces the distribution of their revised price sheet "B", which is now being mailed to the trade.

THE GALT STOVE AND FURNACE CO.

A new catalog has just been issued by The Galt Stove and Heater Co., of Galt, Ont., which illustrates their lines of furnaces of different descriptions, pipeless and otherwise, in a very fine manner. This volume is number seven edition and contains forty pages. The paper used in this catalog is of the finest, and the clear type, well laid out illustrations with complete description of goods, tends to make this copy one that will be of great service to dealers handling this line of goods.

They have also got out two booklets which are titled, "Comfort" and "Unbiased Opinion," both of which should go a long way towards increasing the sales of the Galt lines.

LOOKED THE PART

"My dear sir," said the salesman, courteously, as he handed the customer his package and no change, "you will find that your suit will wear like iron."

And sure enough it did. The man hadn't worn it two months when it began to look rusty.—S.E.

GOT FOOLED

The stingy farmer was scoring the hired man for carrying a lighted lantern to call on his best girl.

"The idea," he exclaimed. "When I was courtin' I never carried no lantern; I went in the dark."

"Yes," said the hired man sadly, "and look what you got."—H.M.

T. G. GRIFFITH & CO.

T. G. Griffith & Co., of Toronto, manufacturers of sanitary equipment for homes, schools, factories, railroads and camps, have issued a new catalog. This book gives a lot of useful information on toilets for districts where there are no sewers, as well as other smaller fittings in the sanitary line. A fine line of sanitary drinking fountains is also described. Throughout the whole catalog, each article is illustrated with fine, clear cuts which materially assist in the description.

"IT IS A DANDY"

"We are very much pleased with Sanitary Engineer in all departments. It is a dandy."

W. C. Hibbert, Carman, Man.

NOT SO SURE

A couple of promoters had just emerged from the grocery store.

"I believe," said the first, "that we've enlisted his support for our scheme."

"I am not certain of that," said the other; "he seemed very suspicious."

"Suspicious! Why do you think that?" demanded his companion.

"Didn't you notice how he counted his fingers after we shook hands with him?"—H.M.

HE WALKED OUT

Little Johnny was seeking information from his father.

"Father," he asked, "freight is goods that are sent by water or land, isn't it?"

"That's right, son."

"Well, then, why is it that the freight that goes by ship is called a cargo, and when it goes by car it is called a shipment?"

And then Johnny wondered why father put on his hat and sauntered outside to get the air.—H.M.

NO SAMPLES

At an advertising convention, the story was told of an advertising salesman who, upon arriving at a certain hotel, was met by the porter who wanted to know how many trunks he carried.

"I use no trunks," the salesman replied.

"Oh, I thought you wuz one of these traveling salesmen," said the porter.

"I am, but I would like you to know that I sell brains."

"Well, you are the furst travelin' fella I seen this season who ain't carryin' no samples."—S.E.

QUICK WORK

He was part of the advance guard of the annual American invasion and passed the huge West End hotel with the Londoner who was showing him round.

"How long did it take you to put that up?" he asked.

"Oh, about three months."

"Gee! We'd do a job like that in three days in New York."

Nothing more until the houses of Parliament. Then: "Say, that place looks mighty good to me, what is it?"

"Don't know," said the Londoner. "It wasn't here when I crossed the bridge last night."—S.E.

DOING NOTHIN'

They had just pulled the cork when a lantern entered the room, followed by a lengthy individual with whiskers.

"By gum, I've ketched ye," shouted whiskers, flashing the star attached to his galluses. "What are you two a'doin here?"

"Nothing," stammered Jones, covetously glancing at the bottle on the table.

"N-nothing," echoed Smith, covetously glancing at the bottle on the table.

"Well, what are ye two aimin' to do?" persisted whiskers.

"N-nothing," said Jones.

"N-nothing," said Smith.

"Whee! !" said whiskers. "Then hold this lantern."—S.E.

MUELLER Stop Cocks, Sill Cocks and Basin Cocks

The wide range of design, the uniform quality and the tested worth of each article make it a pleasure for plumbers to sell and install **MUELLER** goods. The precision with which every thread and joint is finished insures satisfaction to the user and saves time for the plumber. See A-1240, A-1245, A-1513 and A-1517.

Write for catalog and prices. Mail orders given immediate attention.

Forgings and Castings in Brass, Bronze and Aluminum ; also Screw Machined Products.

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

AN IMPROVEMENT in business has taken place during the past week. Price changes have been few and far between. Oakum and cotton waste have had very good sales, as also have eavestrough and conductor pipe, especially O. G. type of trough and the common lines of pipe.

The scrap market still continues to be dull, very little trading taking place; the only bright feature of this market is that during the last two days metals have strengthened somewhat, this being

the only encouragement in this line for some time past.

Copper ingots give out stronger tones and a rise in prices is possible.

Still weaker tones are manifest in connection with prices on pig iron, the mills are not getting the bookings which were expected, and good quantities of iron are in stock at the furnaces.

Collections are reported to be a little easier.

Montreal Markets

MONTREAL, July 12.—Prices which have been in effect for some time back have been maintained almost without exception this week, the scrap metal market being the only market in which a decided weak tone is to be found and while prices have not altered this week it is reported that indications point to a much weaker market in the very near future. The eavestrough and conductor pipe trade is reported good with slight slackening off due to heavy spring buying but dealers anticipate a revival of trade in this line shortly.

In the ingot metal market an improved tone is shown this week with indications that the general decline is fairly well completed.

Collections are reported as fair and business generally is reported as being quite seasonal.

NO PRICE CHANGES IN BOILER TUBES

Montreal.

No price changes are noticed in the price of boiler tubes this week; they are being quoted locally as follows:

BOILER TUBES—

	Seamless	Lapweld
1 inch	20 00
1½ inch	22 00
1¾ inch	21 00
2 inch	24 50	24 00
2½ inch	21 50	20 00
3 inch	24 50	23 00
3½ inch	29 00	24 50
4 inch	34 00	31 00
4½ inch	39 50	35 50
5 inch	50 00	45 00

Prices, per 100 ft., f.o.b. Montreal.

ENAMELLED WARE TRADE IS STILL REPORTED LIGHT

Montreal.

Trading in enamelled ware lines is still reported as light, but dealers report that indications are for a revival of trade shortly, in view of the heavy amount of building under construction in the district. Local quotations are as follows:

Sinks, flat rim—	1 only	2 only	3 only
16 x 24	\$ 7 50	\$ 7 40	\$ 7 30
18 x 30	8 70	8 60	8 50
20 x 30	9 90	9 80	9 70
Bath tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide			51 40
Bath tubs, 5½ feet,			57 10
Lavatories—			
17x19 in. Apron F139 or P4045			15 30
19x24 in. Apron F154 or P3845 or P3847			23 60
19x21 in. Apron F169 or P4205			17 60
17x19 in. Roll rim. F241 or P4345			12 60

Less 30 per cent.

BUILDING ACTIVITIES INCREASE SALES OF PORTLAND CEMENT

Montreal.

Continued building activity is noticed; resulting in an active trade in cement. Prices remain locally as follows:

CEMENT—

Car load lots, per bag, F.o.b. steam cars	0 86
Per Bag, delivered	0 94
Less car lots, per bag, F.o.b. yard	0 94
Per bag, delivered	1 04

Rebate of 20 cents for empty bags.

EAVE AND CONDUCTOR PIPE TRADE REPORTED GOOD

Montreal.

Dealers in eave and conductor pipe report seasonable business, with the sale of conductor pipe slackening down, due to heavy Spring buying, but with indications that the demand will be increased shortly. Local quotations are as follows:

EAVESTROUGH—

O. G. round and half round, per 100 ft. 3 in., \$16.90; 10 in., \$18.70; 12 in., \$22.20; 15 in., \$35.50; 18 in., \$45.00.

O. G. Square bead, per 100 ft.: 8 in., \$15.90; 10 in., \$17.70; 12 in., \$21.20; 15 in., \$34.50; 18 in., \$44.00.

Discount 65 and 5 per cent.

CONDUCTOR PIPE—Round, Plain and Corrugated, per 100 ft.: 2 in., \$18.40; 3 in., \$22.30; 4 in., \$29.60; 6 in., \$48.00; 8 in., \$58.80.

Discount 15 and 5 per cent.

CONDUCTOR ELBOWS—

Plain or corrugated, price per doz. 2 in., \$5.25; 3 in., \$6.00; 4 in., \$10.50; 5 in., \$24.00; 6 in., \$29.00.

Discount 50 and 10 per cent.

SOIL PIPE AND FITTINGS IN FIRM MARKET

Montreal.

No change has taken place in discounts on soil pipe and fittings. Dealers report a fair amount of activity in these lines. Local discounts quoted as follows:

SOIL PIPE—

2 and 3 inch	20%
4 inch	25%
5 and 6 inch	20%
8 inch	net

FITTINGS—

2 to 6 inch	37½%
8 inch	net

MINOR PRICE ADJUSTMENT ON STANDARD OIL CLOSETS

Montreal.

Only one price change is noticed in closet goods this week. The price of the Standard outfit with post hinge seat being reduced fifty cents. Trading locally is reported as fair. Prices in effect locally are as follows:

CLOSET COMBINATIONS—

Low Down Outfits,	each
Closet, standard outfit, oak	24 00
Do., post hinge seat	24 50
Do., oak vitro or Pussyfoot	24 00
Do., post hinge seat	25 50
Do., mahogany vitro or Pussyfoot, post hinge seat and cover	28 00
Do., vitreous china, oak post hinge seat and cover	29 00
Do., vitreous china, mahogany post hinge seat and cover	30 00
Do., white vitro or Pussyfoot, mahogany post hinge seat and cover	30 00
Do., enamelled iron tank, oak post hinge seat and cover	29 50
Do., enamelled iron tank, mahogany post hinge seat and cover	29 50
Add for ¾" valve on supply pipe	1 25

Vitreous china tank with fittings, flush elbow and supply	16 00
Enamelled iron with fittings, flush elbow and supply	16 00

Why not Capitalize the Charm of Solid Vitreous Lavatories?

No. 680—X "Mount Carnarvon," 18 in. x 20 in.
No. 682—X "Mount Chancellor," 20 in. x 24 in.

The "Mount" series embody the most advanced ideas of solid vitreous lavatory construction.

The plain straight lines, slightly squared edges, the roomy slab, the large bowl, the open overflow, the quick-draining outlet, the clear, clean, hard, durable, white surface, so easily kept clean, and withal the stone-like texture of the ware itself, are sufficient to ensure a maximum of satisfaction from every practical point of usefulness, as well as a life-time of durability.

The design shown herewith, is uniform, whether furnished with leg, or for concealed hanger. The two sizes cover most ordinary requirements for either house-hold or public building.

The complete "Mount" series, embraces a very comprehensive line, to cover every requirement. Your jobber will be glad to show you samples or illustrations.

By advocating the installation of solid vitreous fixtures, you render a vital and lasting service to your clients, by giving them the highest grade of sanitary equipment which science has yet evolved.

Thereby you gain their good-will; their approval of your good judgment in the handling of really unapproachable fixtures; their advertising of your methods and your work.

Because the charm of solid vitreous ware is irresistible, the clear white sheen of its time-defying surface, as smooth as glass and as easily kept clean as a china plate, endears itself to the heart of every home-maker, while the true sanitary qualities and durability of the ware commend themselves to anyone who appreciates that years of service ensure the ultimate economy of investing in the best.

No. 680—L "Mount Ball," 18 in. x 20 in.
No. 682—L "Mount Brett," 20 in. x 24 in.

Malleable Fittings—

Price list effective June 1st, 1922. Discount 63 per cent.

QUIET TONE PREVAILING IN RADIATORS AND BOILERS

Montreal.

The radiation goods market takes on a quiet tone this week, but dealers are looking for a revival of trade shortly. Prices now in effect are the same as have ruled for some time past, as follows:

RADIATORS AND BOILERS—

Radiator list prices are for 1, 2, 3, 4 and 5 column radiators, per sq. ft.

15 in. to 38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60. Discount 44 per cent for hot water, and 45 per cent. for steam.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05; Discount 41 per cent.

Boilers—Round t water boilers, sizes from 0 to 10, 52 per cent. off list. Square or sectional hot water or steam boilers, 15 in., 3 per cent. with Ontario Government trimmings, list. Square or sectional water boilers, 19 in. to 36 in., 8 per cent. Square or sectional steam boilers, 19 in. to 26 in., 5 per cent. Ontario Government trimmings, list plus 7 per cent. Square or sectional water or steam boilers, 48 in., list plus 10 per cent. With Ontario Government trimmings, list plus 18 per cent.

Round steam boilers, standard trimmings, 16 per cent. Ontario Government trimmings, 13 per cent.

F.o.b. Montreal, Toronto, Guelph.

GOOD BUSINESS REPORTED IN CORRUGATED SHEETS

Montreal.

Trading in corrugated sheets is reported good throughout the district. There are no changes in prices which remain at levels established some time ago and are as follows:

CORRUGATED SHEETS—

	Per 100 sq. ft.
No. 28 gauge	7 00
No. 26 gauge	7 50
No. 24 gauge	10 00
No. 22 gauge	12 50
No. 20 gauge	14 00
No. 18 gauge	19 00

Less 10 per cent.
Lighter than 24 gauge and wider than 27 ins.
75 cents per square extra.

SLACKNESS NOTICEABLE IN SHEETS AND PLATES

Montreal.

Local distributors report a slackness in sheet metal market. Prices on sheets and plates have shown no tendencies for some time to deviate from the following prices:

BLACK SHEETS—

10 gauge, base	4 75	5 00
12 gauge	4 85	5 00
14 gauge	4 85	5 10
16 gauge	5 05	5 15

The Biggest Water-System Proposition Ever Offered

*26 Styles and Sizes
Reasonable Prices
Highest Quality*

THE Delco-Light Company now comes to the plumber and pump dealer with the best electric water-system proposition ever offered.

Delco-Light Electric Pumps are the natural development of our world-wide business in Delco-Light electric lighting and power plants.

They were designed with our experience of what is needed in the individual water system. There is a style and size to meet any condition which may arise—the pitless deep well pump—

the shallow well pump—large and small capacity—A.C. and D.C. service. The Delco-Light Pump Dealer need never lose a sale, because he has the exact style and size for every need.

And the prices are right.

Remember, these pumps are Delco-Light built. They represent years of electrical research and manufacturing experience.

The Delco-Light Distributor has a mighty interesting proposition for the pump dealer or plumbing contractor. Write to your nearest distributor about it.

COPPER AND BRASS PRODUCTS ARE FIRM

Montreal.

No change in price is noticed in copper and brass products. The market is steady and locally prices are quoted as follows:

BRASS—	
Sheets, base	0 27
Rods, ½ to 2 inches, round.....	0 24
Tubing, seamless, base	0 32
COPPER—	
Rods, ½ to 2 inch.....	0 30
Soft sheets, plain, 16 oz. and heavier, lb.	0 33
Plain tinned, 16 oz. and heavier, lb.	0 40
Polished, and tinned, 16 oz. and heavier, lb.	0 44
Tubing, lb.	0 34
Above prices are for full sheets or bars. Cuts 5c. per lb. higher.	

IRON AND STEEL PRODUCTS ARE WITHOUT CHANGE

Montreal.

Bar products still remain in a firm market with prices showing no change. Prices quoted locally are as follows:

IRON AND STEEL—	
Common bar iron, 100 lbs.....	3 95
Refined iron	5 45
Irish finish machinery steel.....	4 00
Mild steel	3 95
Single reeled machinery steel.....	5 50
Band steel	3 95
Sleighshoe steel	3 95
Spring steel	5 00
Tire steel	4 15
Harrow tooth steel	3 80
Toe caulk steel.....	4 85
Mining tool steel, per lb.	0 19
Black Diamond tool and cast steel, per lb.	0 19

NOTE.—Refined iron is approximately \$1.50 per cwt. over base, but fluctuates owing to unsettled market.

Band steel in scroll bundles, 50c per 100 lbs. extra.
Iron and steel 3-16 in. and thinner, 50c per 100 lbs. extra.

PRICE ON SOLDER CONTINUES TO DECLINE

Montreal.

A steady decline in the price of solder has been noticed for the past month and distributors are now quoting as follows: Strictly 28 cents, commercial 26 cents, wiping 24½ cents, wire solder 40 cents per pound.

SLIGHT ADVANCE NOTICED IN ASBESTOS WICK PACKING

Montreal.

A slight advance is reported by distributors in asbestos wick packing and is now being quoted at 45 cents per pound.

ASBESTOS PRODUCTS—

Off list prices	
2 ply pipe covering	57½%
3 ply pipe covering	55%
4 ply pipe covering	50%
85 per cent. magnesia	35%
Per bag	
Boiler covering	\$1 50
Per 100 lbs.	
Asbestos sheathing	8 25 9 00

IMPROVED TONE NOTED IN INGOT METAL MARKET

Montreal.

The metal markets show an improved tone this week, especially in zinc, which is quite firm, but indications point that the general decline is fairly well completed, although possibly lead may go a little lower in the U. S. A. A great deal depends, however, on the outcome of the European situation.

TIN.—This metal is firmer both in London and New York, showing a recovery of £5 to £6 per ton. It is a little early to prophesy as to whether this will be maintained or not, but sentiment is decidedly better and it is possible that we may see higher prices. The local market is quiet at 45 cents per pound.

COPPER.—The London market is decidedly firm in tone, and while there is no current basis for this beyond sentiment, it has its influence on prices. A settlement of the Ruhr trouble would undoubtedly be followed by a sharp advance.

In the U. S. A. producers are firmer in their ideas, especially for forward shipments. The local market is steady at 20 cents for electro and 19½ cents for casting.

LEAD.—The London market has advanced this week, while American prices

have declined. The latter was inevitable, but it is probable that the decline there is almost complete. It is not likely that prices will advance far as supplies are still ample. The local market is firm at 8 cents per pound.

SPELTER.—This metal has shown considerable strength this week. East St. Louis having advanced over ½ cent per pound with every indication of still higher prices. London is also firm in tone and it is quite apparent that the decline has been overdone. Local market is strong at 9 cents per pound.

ANTIMONY.—There are no new features in this metal which remains firm in tone, although demand is rather quiet. This metal is still very cheap and a renewal of active buying would undoubtedly force prices higher. The local market is steady at 8½ cents for English and 8 cents for Chinese.

Toronto Markets

TORONTO, July 12.—This week's trade again shows signs of a steady improvement over that of previous weeks, good sales having been recorded in nearly every line. Some lines are selling exceptionally well, for example, eavestrough is being disposed of as fast as the manufacturers can turn it out; this applies to all common lines such as O. G. trough.

Scrap metals, which have had a very poor market for the last three months, stiffened a little during the last two days.

Copper ingots give out a very firm note, and the price of this metal is expected to move a little higher. All other ingots show no changes in price tendencies and remain steady at last week's levels.

Collections are improved locally, dealers are expecting further improvements in this direction as soon as the crops are harvested.

DECLINE IN TWO TYPES OF BOILER STANDS

Toronto.

Adjustable boiler stands 12 to 14 inch which were selling at sixty cents each are now quoted at forty-five cents each, and Stahl boiler stands which sold for seventy cents each are now quoted at sixty cents each.

BOILER STANDS—

Each—5 gal. \$1.50; 12 gal. \$1.50; 18 gal. \$1.50; 25 gal. \$1.50; 30 gal. \$1.50; 35 gal. \$1.75; 40 gal. \$1.90; 52 gal. \$2.10; 66 gal. \$2.25; 82 gal. \$2.50; 100 gal. \$3.80; 120 gal. \$4.00; 144 gal. \$4.00; 168 gal. \$4.00; 192 gal. \$4.00; Adjustable Stands 12 to 14 in., 45c. Stahl boiler stand, 60c.

COTTON WASTES ARE SELLING FAIRLY WELL

Viking Radiators

A satisfactory heating system is only obtainable through perfect radiation. On your installation the boiler may be the finest that can be procured, and your mains and leads properly installed but the work will not be productive of best results unless the radiators preform their function in a proper manner.

Viking radiators will complete the best possible job, one that you can be sure of satisfying your customers.

Write us about your requirements.

Magnesia pipe covering	less 40 per cent.
Magnesia pipe covering, small lots, less	35 per cent.

Are You Chasing Prospects?

Most good merchant plumbers are hotfoot after Gas Water Heater business just now—

But it's hardly worth while selling some heaters; your profit is all eaten up by return trips and adjustments.

The Marvel—built in one piece—is simple and inexpensive to install and once installed it stays put. You keep all the profit. With its low cost, high efficiency, economy of gas consumption and neat appearance, the Marvel is easily sold—and, moreover, it stays sold.

Sold Only Through Plumbers.

Burnham Boilers

BUT

Do They Do
What They Say
They Will Do?

The Square Burnham is made in 38 sizes, 19 each for water and steam.

if a Burnham rating says it will do a certain thing, then it will certainly do that thing.

Lord & Burnham Co. Limited

(Boiler Department)

Harbor Commission
Building,
Toronto, Ont.

Factory:
St. Catharines, Ont.

A Suggestion

"Medium Weight soil pipe has a round bead pattern at the hub to distinguish it readily from the Extra Heavy weight pipe which has a flat bead pattern.

This is only a matter of design, one being as strong as the other.

We respectfully suggest the advisability of continuing the excellent practice of invariably specifying medium weight pipe in the round bead pattern."

**TORONTO HARDWARE MFG.,
CO., LIMITED**

Winnipeg, Man.

WINNIPEG, July 12.—Merchants from Western centres report that business is steadily improving but there is room for increased business. Building has been fairly active in the larger cities. Crop reports are very favorable and indications point to a bumper crop which will mean that business will be stimulated once the crops are harvested. Price changes are few, although primary markets are ruling steady. Range boilers and boiler tubes maintain a steady level. A firm tone prevails in the pipe fitting and soil pipe markets. Sheet lead and galvanized black and Canada sheets are selling freely. There is a slight decline on wrought washers, while compression goods show no change.

WROUGHT PIPE CONTINUES FIRM

Winnipeg.

There has been a seasonable demand for wrought pipe, and the following prices are ruling steady:

PIPE WROUGHT—	Per 100 Feet	
	Blk.	Galv.
1/8 in.	7 20	9 75
1/4 in.	5 10	7 50
3/8 in.	5 25	7 65
1/2 in.	6 80	8 50
3/4 in.	8 30	10 25
1 in.	11 90	14 75
1 1/4 in.	16 10	19 95
1 1/2 in.	19 25	23 85
2 in.	25 90	32 10
2 1/2 in.	40 90	50 75
3 in.	53 50	66 40
3 1/2 in.	68 80	84 30
4 in.	81 50	99 85
4 1/2 in.	96 50	117 80
5 in.	112 50	137 35
6 in.	146 00	178 00

EAVES AND CONDUCTORS STAY AT STEADY PRICES

Winnipeg.

There is no change in the prices of eaves and conductor pipes on the local market. There is the usual summer demand and an improvement is reported from all sources. Current quotations on the local market are as follows:

EAVESTROUGH—	
Size 8 in. per 100 feet.....	6 08
Size 10 in.	6 75
Size 12 in.	8 10
Size 15 in.	11 25

CONDUCTOR PIPE—

Size 2 in. per 100 feet.....	7 43
Size 3 in. per 100 feet.....	8 55
Size 4 in. per 100 feet.....	10 80
Size 5 in.	15 30

GOOD DEMAND FOR SHEETS AND PLATES

Winnipeg.

Wholesalers report that there is a steady demand for galvanized black and Canada sheets. This is due largely to the increased activity in building circles. The following quotations remain unchanged.

CANADA PLATES—		Per box
Size 18x21, Blue.....	7 50	
Size 18x24 Blue.....	7 50	
Size 20x28 Blue.....	7 50	

SHEET IRON—Galvanized—

Size 16G	8 25
Size 18G	8 40
Size 20G	8 40
Size 22G	8 55
Size 24G	8 55
Size 26G	8 70
Size 28G x 30.....	9 00
Size 28G x 36.....	9 30
Size 10 1/2 oz. x 30.....	9 40
Size 10 1/2 oz. x 36.....	9 70

SHEET STEEL—BLACK—

Size 10G	6 35
Size 12 G	6 35
Size 14 G	6 50
Size 16 G	6 55
Size 18G and 20G.....	7 15
Size 22G and 24 G.....	7 20
Size 26 G	7 25

SHEET LEAD SELLING FREELY

Winnipeg.

There has been a steady demand for sheet lead, and 3 and 3 1/2 pounds are quoted at 15c. and 4 lbs. and over at 14c.

SOIL PIPE PRICES UNCHANGED

Winnipeg.

There is a fairly steady demand for soil pipe and prices are fully maintained on the local market.

FIRM TONE MAINTAINED IN PIPE FITTING MARKET

Winnipeg.

The local pipe fitting market maintains a firm tone and with building activity, an improvement is expected.

QUOTATIONS ON BOILER TUBES STEADY

Winnipeg.

There is no change in prices on boiler tubes. There has been a good demand for this line and the following sizes are quoted as listed below:

BOILER TUBES—

Size 1 3/4 inch diameter per foot.....	0 28
Size 2 inch	0 25
Size 2 1/4 inch	0 29
Size 2 1/2 inch	0 30
Size 3 inch	0 41
Size 3 1/2 inch	0 47
Size 4 inch	0 62

NO CHANGES IN QUOTATIONS ON RANGE BOILERS

Winnipeg.

There is a steady seasonable demand for range boilers which is keeping pace with local building activity. Prices show no change.

WROUGHT WASHERS AT LOWER LEVELS

Winnipeg.

A decline is quoted on wrought washers and the following sizes are quoted as listed below:

WROUGHT WASHERS—	Case lots less	
	Per 100 lbs.	
Size 3-16 inch.....	14 10	14 60
Size 1/4 inch	12 48	12 98
Size 5-16 inch	11 76	12 26
Size 3/8 inch	10 95	11 45
Size 7-16 inch	10 32	10 82
Size 1/2 inch	9 96	10 46
Size 9-16 inch	9 87	10 37
Size 5/8 inch	9 78	10 28
Size 3/4 inch	9 69	10 19
Size 7/8 inch	9 60	10 10
Size 1 inch	9 60	10 10
Size 1 1/4 inch	9 78	10 28
Size 1 1/2 inch	9 78	10 28
Size 1 7-16 inch.....	9 78	10 28
Size 1 1/2 inch	9 78	10 28

NO CHANGE IN COMPRESSION GOODS

Winnipeg.

There are practically no changes in quotations on compression goods.

Calgary, Alta.

BOILERS AND RADIATION

GOODS DECLINE

Among the farm trade certain June activities have been delayed or postponed. This is noticeable in fencing and pump sales, which no doubt will catch up with any off weeks the farmer may have before harvest and threshing time. Price changes seem to be few, and values seem to have settled on a stable basis. Travellers feel that after the last element of chance has been removed regarding the crop, that a large list of accumulated needs will develop, and are urging their buying departments to anticipate this.

An adjustment downward on boilers and radiators has been made. The following schedule of discounts is effective at Calgary, Edmonton and Lethbridge.

Round hot water boilers, all size, 15% off.
Square hot water boilers, 19 to 36 in., 10% off.
Square hot water boilers, 48 in. Plus 8%.
Round steam boilers, all sizes, gov. trimmings, 14% off.

Square steam boilers, 19 to 35 in., gov. trimmings, plus 6%.

Square steam boilers, 48 in. Gov. trimmings, Plus 15%.

Radiation, 2, 3, 4, 5 Column: Hot Water—38 in. \$61.98; 32 in. \$68.17; 30 in. \$71.27; 26 in. \$74.37; 23 in. \$78.09; 22 in. \$80.57; 20 in. \$84.29; 18 in. \$86.77; 16 in. \$92.96; 14 in. \$96.06; 13 in. \$99.16.

Radiation 2, 3, 4, 5 Column: Steam, 38 in., \$61.05; 32 in. \$68.15; 30 in., \$79.21; 26 in., \$73.2; 23 in., \$76.92; 22 in., \$79.37; 20 in., \$83.03; 18 in., \$85.48; 1 in., \$91.58; 14 in., \$94.63; 13 in., \$97.68.

Wall Radiation—Hot Water or Steam—9 and 7 foot loop—\$67.99; 6 foot loop—\$71.23; 5 foot loop—\$74.46.

CLOSET TANKS, ETC.

A general reduction is effective on Closet Combinations, Tanks, and Bowls, which are now quoted as follows:

Closet Combinations. Complete with Wash Down Bowl—

Wood Oak Tank with W. S. Seat.....	28 70
Wood Oak Tank with P. H. Seat.....	29 50
Vitro or Pussyfoot Oak Tank with W. S. Seat	28 70
Vitro or Pussyfoot Oak Tank with P. H. Seat	29 50
Vitro or Pussyfoot Mah. Tank with Mah. P. H. Seat	30 30
Vitro or Pussyfoot White Tank with Oak P. H. Seat	31 50
Vitro or Pussyfoot White Tank with Mah. P. H. Seat	31 90

Are These The Opportunities You're Looking For?

Fan Heating and Ventilating Engineering is the pinnacle of all other forms of heating, and of all branches of steam fitting and sheet metal work. It prepares you for:

1. For Employers it enlarges their business opportunities 100%.
2. Employees it raises to Foremanship of a large shop.
3. Or as Designing Engineer of some large Heating Contractor.
4. As an intelligent Salesman of Heating Appliances.
5. As Chief Engineer with a Heating or Furnace Manufacturing Co.
6. Later a Consulting Engineer to Architects and Building Contractors, etc.

Which of These Are You Working for?

PNEUMATIC WATER SUPPLY SYSTEM

Gives country residents all the advantages of a city water system without the excessive cost

The wide-awake dealer will make big profits out of this system among customers who now have difficulty with their water supply. It is so simple to operate and costs practically nothing for upkeep.

The outfit consists of an air-tight steel tank which can be placed in the basement, and a "Myers" famous guaranteed pump (hand or power), suitable for pumping air or water, together with pipes and fittings. Any plumber or gas fitter can easily install it. Every outfit guaranteed to do the work for which it is designed. For small or large dwellings.

Write us for Water System Catalogue and prices. Now is the time to interest your customers.

Farrfhern

Atmospheric Steam Heating Systems

Give a noiseless perfect circulation, without the use of air vents or traps on radiators.

No Vacuum Pumps are used. Consequently it saves fuel and costs for maintenance.

Farrfhern Heating will make the work of Contractors more profitable.

It is for buildings of every type and size.

Let us co-operate with you on the next heating prospect. The more difficult it may be, the better we will like it.

**Esteemed
Customer;—**

Dear Sir:—

Because, at the beginning of our career, we considered that the High Class PLUMBER was the BEST judge of Plumbing Material, and built our product accordingly, is one reason for the success that has accompanied our efforts to serve the Plumbing Trade.

Combined sanitary and mechanical knowledge has been devoted to the production of a line of Plumbing Specialties that are sure to meet every need of the Plumbing Trade. For sterling worth and sanitary efficiency the Wolverine line of Plumbing Specialties has no superior, if a rival.

The endorsement of Wolverine Products by our friends of the Sanitary and Heating Trade in the Dominion of Canada, is one proof, at least, of the quality of our product. When Plumbing Specialties are needed, no mistake is possible if WOLVERINE PRODUCTS are installed.

You have probably learned that the Plumber who works on the theory that all goods are alike, is courting trouble with his trade.

To-day Wolverine Products are the mature expression of our intimate knowledge of Plumbing Specialties, their function and ultimate responsibility. "Since seeing is a large part of believing," it is our earnest wish that you could see the careful, highly skilled processes, and the quality of materials which combine to produce over five thousand Wolverine Products—all unconditionally guaranteed.

The dominant law of WOLVERINE is SERVICE to the PLUMBER, not only in maintaining a higher quality standard, but in getting the goods to you—when you want them—the way you want them—complete and ready for installation.

We know that it is not necessary to constantly tell you of the high quality of Wolverine Goods, but we take this opportunity of reminding you that our service is bigger and better than ever before.

REMEMBER WOLVERINE GOODS ARE DELIVERED INTO YOUR HANDS ALL CHARGES PAID—WORTH A THOUGHT—EH?

Yours for Service,

WOLVERINE, LIMITED.

Quickly Set for Any Pressure

The Donnelly Pressure Relief Valve is installed to-day in over 50,000 homes, stores and other buildings, safeguarding night and day, life and property.

For all closed plumbing and hot water heating systems it makes homes safe.

The Donnelly Valve has no interior springs and no weights of any kind. The setting mechanism is so simple that any mechanic can easily and quickly set it for any pressure from a fraction of a pound up—an exclusive feature.

Suggest the use of a Donnelly Valve on your next hot water job. Better service and greater profits ensue.

Ask your Jobber or write us.

VITRO

NOTROUBLE
TANK

Don't do it, please

Every Vitro Tank before it leaves the factory has been thoroughly tested under water pressure to 150 lbs.

It has been inspected at the factory for perfect operation and quality.

The Ball Cock, Lever and all Fittings are made up working tight.

They do not need further adjustment. We respectfully request the trade to instal them as they are. Additional adjustment is more likely to prove detrimental than beneficial.

The Best Urinal Tanks are Solid Vitreous

No. 563. 3-gal. Bellemeade High Tank.

No. 565. 5-gal. Bellemeade High Tank.

No. 568. 8-gal. Bellemeade High Tank.

In probably no other installation is the choice of absolutely dependable sanitary fixtures as important as in that of Urinal Stalls.

It is a compliment to all-clay ware that Stall Urinals are usually made therefrom. Were it practicable to manufacture these stalls in Canadian Solid Vitreous Ware, the latter would unquestionably have preference, being the highest development of all-clay sanitary ware.

To complete a thoroughly sanitary installation, however, none other than SOLID VITREOUS tanks should be used. Each tank is one solid piece of hard burned all-clay ware—vitreous through and through—glazed a pure white inside and out—its surface as smooth as a pane of glass, and as easily kept clean as a china plate.

There are no joints in these tanks to open up, no wood to split, no paint to scratch or wear, no coating to chip off, disintegrate nor discolor, no composition to warp or become unsightly. Being vitreous through and through there is no danger of absorbing dangerous acids and the unchanging white smooth surface will neither attract dirt nor germs.

The Bellemeade is of simple, pleasing, graceful design. The three sizes illustrated can be adapted to cover the requirements of any size battery and are made for either top or bottom supply, as required.

We furnish these tanks through the trade either without fittings, or fitted complete with the best trimmings obtainable—either automatic or regular.

AIR VENTS

Models For All Purposes—Built to Wear

No. 31
Wood Wheel

An Air Vent of soft metal that will not stand up under pressure is valueless.

All Air Vents are under pressure--constant pressure--24 hour pressure.

All Air Vents are subject to wide variations in radiation temperatures--to boiling hot water--to cutting steam pressures.

All Air Vents here shown are hard metal cast brass, with seats that will not cut—they resist pressure, give long service and satisfaction with freedom from whistling, leaking, dripping.

Cutting the Hours

On a job these days of high labor cost is what makes the difference between profit on a job, or breaking even or worse.

The Williams will cut nine-tenths off the hours it has taken you to cut your pipe by hand.

That's Cutting the Hours Some, Isn't It?

Not only will the Williams cut, thread and ream your pipe in one-tenth the time, but it makes cleaner cuts and more perfect threads.

Williams have got a time payment plan by which the Williams earns itself.

Our booklet, "Smashing Costs and Boosting Profits," tells you all about "Cutting the Hours" on pipe threading and cutting costs. Write for it to-day.

New King Hot Water Boilers save fuel this way

Saving fuel is but one of many advantages that appeals most strongly to prospective purchasers. The following details of construction ensure the maximum production of heat, delivered to the rooms, with a minimum expenditure of fuel:—Positive unobstructed upward circulation; two-way nipple construction guarantees non-stagnation of water in every section; grates operated by the improved King System; every boiler furnished with smoke control. Smooth, clean finish, unexcelled workmanship.

IMPERIAL RADIATORS have graceful, pleasing lines; they add beauty to a room. Then too, they are so constructed that they give positive, unfailing heat satisfaction throughout their long years of service.

Is Your Kitchen Sink 36 Inches High?

A woman's household duties require her to be at the kitchen sink several hours daily. Because a great many of the old-fashioned sinks were installed too low, it necessitates a lot of stooping on the part of your wife. The net result is back-ache.

You can remedy this by getting her correct height, up-to-date sinks. We have them.

— A Modern — Pedestal Lavatory

A pedestal wash basin puts that "finishing touch that means so much" to every bathroom.

The wash basin is used more than any other fixture in the modern bathroom.

There's something substantial in its appearance and although it costs a little more, it's worth it many times over.

We can supply you with this and many other fixtures that will go far towards making your bathroom a place of health and comfort.

Building a Reputation?

Many plumbers have built up a big reputation and trade in **"Standard"** Plumbing Fixtures through making systematic use of our **FREE CUT SERVICE**, running attractive advertisements which we supply with their own name at the foot. These striking little advertisements are single column in width $4\frac{1}{2}$ inches deep, with open space at bottom where your local printer prints your name.

Write for folder showing these free cuts.

Our Own Advertising Efforts

Plumbers who tie up to our own advertising, which is running in Canada's finest magazines, farm papers, and city weekly paper rotogravure sections report excellent results. Identify yourself with this advertising.

NO. 7 ANGLE CHECK VALVE, CHECK VALVE AND BRASS GLOBE VALVE

TO RENEW A VALVE DISC IN SIXTY SECONDS

With an extra disc holder at hand, you can put a new disc in any one of these valves in less than a minute. The bonnet ring of malleable iron affords a sure grip for your wrench. The holder slips right off the stem. Another holder and the new disc replaces it. The bonnet goes on again

in a jiffy and the valve is in service. Persistent hard usage will not destroy these valves. The heavy bodies are of non-corroding brass and ring nuts are malleable iron to give extra strength and lasting quality. As with Crane valves for every purpose, each No. 7 valve is tested before shipment.

The Value of Repetition

One of the greatest business houses on the continent has for its motto this slogan: "Keeping Everlastingly at It Brings Success."

This is the Keynote of the concern. To fail the first time means only that they put more kick into the second attempt, and selling pressure is increased progressively with each defeat.

This firm to-day is an outstanding success. Apply this policy to your own efforts when you go after rural sanitation business. Tell your story over and over again. Don't take "NO" as an answer. It takes a long time for a new idea to sink into some men's minds.

Keeping Everlastingly At It Brings Success.

No Unfair Competition on These

Sold only through plumbers

HOTSTREAM Heaters will give more heat at less cost than any other heater—and they cost less.

Whether your customer wants only our No. 20 Double Coil Heater for a small house or the Giant Triple Coil No. 80 he is assured in either case of sure, certain satisfaction.

No unfair competition from gas companies or department stores cut into your profits when you sell HOTSTREAM. It is sold through plumbers exclusively.

Splendid business in rural and suburban localities can be had in selling No. 20 K.W. Kerosene Heater. No smoke, odor, trouble or danger. Guaranteed performance on very low fuel cost.

Write to-day for prices.

Says Definite Progress is Being Made in Canadian Rural Sanitation

Big Field for Plumbing and Heating Equipment Being Rapidly Opened Up—Setting an Important Precedent for Generations to Come—Western Plumbing Jobbers Report Good Volume of Business on Books—Another Good Crop Will Help

Based on an interview of Sanitary Engineer with Major L. L. Anthes, Managing Director Anthes Foundry Co., Toronto

JUST returned from a series of business trips which have taken him to Western Canada and to various parts of Ontario and Quebec province, Major L. L. Anthes, Managing Director Anthes Foundry Co., Ltd., has outlined some of his impressions to Sanitary Engineer.

Concerning the West, he is of the opinion that if the bumper grain crop which is now in prospect really materializes, Western business will be helped considerably by reason of the fact that much of the heavy indebtedness which now overhangs practically every part of the prairie provinces will be liquidated. Several good crops were necessary at to-day's prices to place the Western farmer in position to go ahead with a clean sheet and plan on extensions and additions without having to be too considerate of his financial position. The farmer's inability to buy sanitary equipment, farming machinery, etc., was said to have been acting as a considerable brake upon these departments of business and credit conditions throughout practically every line were said to offer much room for improvement. Contrary to the opinion held in some quarters, last year's crop was not so profitable to Western farmers that they were able to liquidate much of their indebtedness, but it was felt that a good crop this year will, providing prices do not suffer by too rapid marketing, help the situation considerably. Southern Alberta was said to have prospects of the best crop in its history.

Building

Building was reported to have slackened off in Calgary and certain other prairie cities according to permits, though these cannot always be taken as a fair indication of the amount of building to be done. A certain amount of replacement work was keeping plumbing and heating engineers fairly busy in some of the larger centres. Plumbing and heating supply firms reported considerable business on their books, to be closed out this summer and early fall, and expressed confidence that gradual improvement would be noted as the time for harvest

came nearer and after the crop was marketed. Manufacturers of harvesting machinery were looking forward to improved buying sentiment among Western farmers in August, when the crop indications were a little more definite and providing prices are maintained.

There was said to be more of a tendency toward mixed farming in many parts of the West and this, according to Major Anthes, would gradually remove much of the speculative nature of Western farming activities.

Need Immigration

The outstanding need for more immigration was emphasized, it being pointed out that this need was very apparent in many parts of both eastern and western Canada. In the West additional settlers of the right type would help to market the crop, it being pointed out that this year as in all years when a bumper crop is in prospect, the problem of taking it off is developing seriously. Such settlers would also help to put additional acres under cultivation. The recent action of the Canadian Senate in refusing to sanction the building of certain branch lines to serve new agricultural districts was thought to be much out of line with the desirable development in this direction.

Despite this temporary condition in the West, Major Anthes was of the opinion that the progress being made in rural sanitation throughout the country as a whole, and the great need for sanitary facilities on the farms, justified Western plumbers in going aggressively after such business. True the average Western farmer was looking twice at his money before spending it, but as a rule he was willing to spend money if he could see possible returns.

"What can the Western farmer buy which is of more lasting quality and will give such service and lend so much additional comfort to his home life than modern sanitary equipment?" asked Major Anthes, pointing out that this was the basis on which prospects could be approached. One of the big problems was

MAJOR L. L. ANTHERS

Plumbing Legislation May be Revived

Ontario Sanitary Measures Introduced by Hearst Government Likely to be Made Law by Present Legislature, Say Those Interested in Undertaking

THERE is a strong possibility that when the new Ontario legislature meets, one of the important measures that will occupy its attention will be that of the plumbing legislation which was brought up by the last Conservative government in power. It will be recalled that this government's tenure of office came to a close before the plumbing bill had received its final reading and that the bill was then shelved by the incoming U. F. O. government, nothing further having been done with it up to the present.

Despite its dormant condition, however, it has by no means been forgotten. As late as this May the Ontario Society of Domestic, Sanitary and Heating Engineers, assembled in convention in Toronto, discussed the present status of the legislation at considerable length, as will be recalled by readers of Sanitary Engineer, where a full report of the convention proceedings appeared.

At that time it was mentioned in the report of Secretary Frankland that the provincial bylaw was all ready, awaiting the signature of the lieutenant-governor, a statement to which exception was taken by Wm. Newell, of Hamilton, who stated that no schedule was available to be worked on because the proposed bill had been brought up by a former government which had failed to pass it and that it was now dead as a consequence.

President Swanston's reply embodied the following information: "What we have is a proposed provincial regulation.

Unfortunately that regulation has not become law. That is due to the fact that it has not been endorsed by the lieutenant-governor or provincial secretary. While it is not a legal measure, the man who rendered assistance has expressed the opinion that if each of the various municipalities throughout the Province saw the necessity of adopting any part of the proposed measure that ultimately the provincial legislature would have no other course but adopt it as a whole."

It has been felt that, whereas the fact that the late U. F. O. government did not have a clear majority in the House and was not, therefore, so ably fitted for the handling of contentious legislation, the large majority enjoyed by the present government should aid materially in passing such bills as the plumbing bylaw.

Provincial Sanitary Engineer F. A. Dallyn, who has interested himself strongly in support of the proposed legislation, had not yet returned from his summer vacation when a representative of Sanitary Engineer visited his offices recently, but members of his staff expressed the opinion that there was little doubt but what the matter would be gone into on Mr. Dallyn's return, and that if investigation showed that the time was ripe for once again bringing it to the attention of the authorities, this action would be taken without delay.

Big Decline in Imports of Baths, Closets, Sinks, Etc., From United Kingdom

Stamped and Coated Products Secured in 1922 Only One-Quarter as Great as in Years Immediately Preceding—Down to \$5,661

THE falling-off in the importation of stamped and coated products such as baths, tubs, closets, lavatories, sinks and laundry tubs from the United Kingdom, is a subject which has been one of much comment of recent months. Whereas 1919 and 1920 had seen Canada importing these goods from the United Kingdom, particularly Scotland, in good quantities, imports for the year 1922 were only about one-quarter those of either of the two years immediately preceding.

In 1920, Canada imported these wares to a total value of \$111,211, of which amount \$20,460 came from the United Kingdom. In 1921 the figures for the total were down to \$65,356 but those of the imports from the United Kingdom remained well up to the mark at \$21,396, a slight increase over the previous year.

In 1922, however, when the total of these imports had risen up to \$92,823, the imports from the United Kingdom dropped down to \$5,661. When it is considered that this extremely low total contains purchases from a number of firms, it will be seen that none of the British firms selling to the Canadian trade have enjoyed the business that was theirs in the years immediately preceding.

On the smaller products, such as agate, granite or enamelled iron or steel ware, a different story is told, though here, too, the figures are deplorably small when compared to those of pre-war days, even though a slow climb is being noted. In 1914 Canada's imports of such goods from the United Kingdom were valued at \$75,132. In 1919, they were but \$642, in 1920 this total was nearly

trebled to reach \$1,864, in 1921 it had risen to \$3,288 and in 1922 was up to \$5,515. The total imports of these goods last year were valued at \$90,886 of which amount, goods to the value of \$78,768 came into the country from the United States, as compared with imports of \$202,951 from that country in 1914 when the total importations reached \$368,619.

Taking the total of all stamped and coated products imported into Canada last year, though, the United Kingdom is seen to be far below her position of pre-war days. The total of these imports in different years has been: 1914, \$1,275,318; 1919, \$2,232,838; 1920, \$1,863,692; 1921, \$1,909,167; 1922, \$1,511,308. During the same years, the total of these goods being imported from the United Kingdom were as follows: 1914, \$227,926; 1919, \$50,790; 1920, \$71,033; 1921, \$188,437; 1922, \$77,705.

SAYS DEFINITE PROGRESS

(Continued from previous page)
said to be the tendency for farmers to leave certain Western agricultural districts and to leave the rural districts in Eastern Ontario for the larger cities. Much of this could be stopped if rural life was made more attractive as was possible with modern conveniences.

"Definite progress is being made in Canada in connection with rural sanitation," pointed out Major Anthes, who referred to statistics showing an increasing number of syphons and other equipment for septic tank installations. It was his opinion that the active steps being taken at present to show the value of such equipment in rural homes was having effect.

"In connection with rural sanitation," he said, "I was interested in receiving information from an authority recently to the effect that proportionately Canada is now ahead of the United States in rural sanitary installations, whereas only a few years ago the situation was the reverse. This is a particularly desirable situation not only from the standpoint of immediate business, but because it sets a precedent which will make it very much easier to sell such equipment in future as our population increases.

Asked concerning the difficulties sometimes experienced with septic tanks particularly in the very cold weather of Western Canada, Major Anthes stated that such difficulties had practically disappeared since the trade became more conversant with septic tanks and that the broader recognition of the fact that the piping carrying the effluent to the disposal field was less likely to give trouble when placed eighteen inches below the surface of the earth, had put an end to much of the difficulty from freezing. Bacteria action is necessary to keep the effluent from freezing, plainly evident from the fact that farmers do not place their grain seed away down in the ground where there would be practically no germ action. The same principle applied to septic tanks effluent, and an understanding of this principle greatly minimized the danger.

Gas Heater Campaign Which Plumbers Could Conduct

THE gas company at Battle Creek, Michigan, decided to put on a hot water heater campaign. The campaign was started April 7 and ended three weeks later. And in those three weeks there were sold 207 tank heaters and five automatic heaters. Also ten others, for good measure, on the two days following the close of the campaign.

The total cost of the campaign, exclusive of the time of the regular force of gas employees, and the services of one salesman for three days, was \$360. This amounts to about \$1.62 as the selling expense for each heater.

The gas company mailed 7,000 circular letters to prospects. It also ran eight newspaper ads in two local papers. The largest ad was sixteen inches long by five columns wide, and the smallest was eight inches by three columns. All told, 736 inches of newspaper space was used.

In the newspaper advertising the company talked price and terms almost ex-

clusively, which are the things to talk in the heat of a campaign.

It may be interesting for those who are interested in advertising to know this: The days following the nights when no ads were run, sales fell off. Form letters create an interest, but paper advertising clinches sales.

The company maintained a good window display during the campaign.

The heaters were sold for cash; also on time payments—a dollar down and a dollar a month.

Now the point of all this is as follows: Two hundred and twenty-two hot water heaters were sold in Battle Creek that might just as well have been sold by plumbers. This thing has happened not only in one city, but in many cities, and, sad to say, it keeps on happening. One plumber in a town, or an association of plumbers in a town, can plan a campaign, and do what gas companies are doing.

his credit; express money orders; travellers' cheques and postal money orders. Two cents in stamps if the amount does not exceed \$50, two cents for every \$50 or fraction thereof up to \$2,500 and on amounts exceeding \$2,500, the maximum tax of one dollar.

Amendments to Section 3, paragraph 1, are such as to have the effect of making subject to the tax all receipts for \$10 or upwards by or on postcards, form letters and letters, which formerly were exempt.

In connection with receipts which have not been stamped in accord with the regulations there is the following provision:

May Be Stamped Within a Month

"A receipt given without being stamped may be stamped within one month after it has been given, upon the following terms: The stamp shall be affixed to the receipt in the presence of any collector of customs and excise by the person who gave the receipt, and shall be cancelled in the same manner as provided for all other cancellations, by writing across it. Before such person may affix the stamps he shall pay to the said collector of customs and excise a penalty of ten dollars for the public uses of Canada. The collector shall write on the receipt a certificate to the effect that the stamp was affixed in his presence by the person who gave the receipt and that such person before affixing the stamp, paid to the said officer the penalty of ten dollars; and the certificate shall bear the date on which it was given and shall be signed by the officer."

Legal Aspect

Changes in Section 3 also deal with the legality of unstamped receipts in the courts. Upon production as evidence

(Continued on page 14)

Must Not Use Post Office Stamps for Excise Taxes after October 1

Special Excise Stamps Must be Used for Cheques, Receipts, etc.—After a Month a Receipt can be Stamped Upon Certain Terms and Payment of Penalty—Legal Value of Unstamped Receipts

DETAILS of the official regulations issued to customs collectors in connection with the excise tax changes coming into effect on August 1 and subsequent dates, as secured by Sanitary Engineer, sets forth some details which plumbers should keep before them, at this time. These details will answer enquiries such as are now being made by operators.

Changes to be made effective from October 1 next, according to latest advice cover the use of Post Office stamps for excise taxes in the following regulation:

"On and after October 1st next, postage stamps may not be used in payment of stamp tax on cheques, bills of exchange, drafts, promissory notes, bank statements for advances or overdrafts, receipts, stock or bond transfers, express money orders, travellers' cheques, matches or playing cards, that is, 'Excise Tax Stamps' only must be used for payment of the stamp tax in all such cases."

Maximum Amount on Receipts

On August 1, 1923, Sections 1, 2 and 3 of the Special War Revenue Act will be deemed to have come into effect. This provides that \$1 will be the maximum amount of tax payable on cheques; bills of exchange payable on demand or at sight or on presentation, or within three

days after date or sight; receipts for money paid to a person by a bank chargeable against deposit of money to

Chinese Steal Plumbing

VANCOUVER, B.C.—Theft of lead pipe and other plumbing materials, particularly by Chinese, have become so frequent in this city that owners of houses are being asked to co-operate with the police department in restricting the thefts as much as possible by having all plumbing stamped in such a way as to make identification possible. Chief James Anderson stated that something of the kind should be done because the department found it possible to recover large quantities of stolen goods but often found owners unable to identify any particular piece of lead pipe or other plumbing materials as their own property.

Incidentally, the chief remarked, several of the Chinese who make a practice of lead pipe stealing are so methodical that the police quite often are able to trace the thief by the peculiar manner in which the pipe is cut.

Country Is Full of Splendid Opportunities Such As This for Plumbers

Ontario Town Advertised for Practical Plumber and Tinsmith,
Now Conducting a Growing Business and is Highly Respected by
His Townsfolk—Believes in Giving a Square Deal

WHERE THE OPPORTUNITY LIES

THERE are, no doubt, many men conducting what they think to be a fairly good business in the plumbing and heating industry in some of the small towns in Ontario, but, nevertheless, there are literally thousands of real good chances still awaiting men who really know the business.

Edwin Newsome, contributing editor of Sanitary Engineer, states: "I have had the opportunity of seeing conditions as they are and can assure even the most skeptical that what is sorely needed in our rural districts, before any great strides can be made towards furnishing 'city conveniences on the farm' is, that real good mechanics establish themselves in small rural towns and villages. There are lots of botchers, lots of men who claim to be plumbers and practical men who have not even learned how to do some of the most simple jobs. If some of the owners of small shops in our larger cities would only pick up and locate in these small centres, they would begin to make money right from the start.

"Talk about teaching the farmer to install his own plumbing is rather too far fetched a yarn, and this has been talked of by many because farmers have been so disgusted at the miserable attempts made to do a good job by so-called or self-assumed 'mechanics,' that the farmer has been led to believe he could do a much better job. As one farmer said to me: 'If that kind of a job represents good plumbing work, I can beat it into a cocked hat.' But when told just what a good job would look like, he admitted that it would be impossible for him to even attempt such a task.

"This is merely given with a view of trying to convince the reader that there are lots of good openings for smart men. Men who can give proper service to the public, and as an illustration, one example alone is going to be reported."

A. M. ROBERTS, Sanitary Heating Engineer, Otterville, Ont., is conducting a splendid business in that town. He is highly respected and praised by many of the prominent businessmen of Otterville.

These expressions given Sanitary Engineer, resulted in an interview with Mr. Roberts and this is how he replied to a number of questions:

"How did you happen to strike Otterville Mr. Roberts?" To which he replied: "About three years ago, I was working in Port Perry. I and my wife had planned to go west. When I noted an advertisement in one of the Toronto papers which read something like this:

Wanted:—A practical plumber and tinsmith, with wide experience, to locate and establish a business in Otterville.—Otterville Board of Trade.

"I came to Otterville, met the men who had been responsible for the advertisement, gave the town a 'once over,' was well impressed and here I am, and am doing a very nice business. The best business men in the town and surrounding districts give me their work and as a rule I have all I can handle."

Mr. Roberts started to learn the trade about 21 years ago, is a Port Perry born man and is blessed with a life partner who hails from Lancashire. He has done a little travelling about the province and in that way has gained a mass of

valuable experience. His first move was to go from Port Perry to Bancroft. Then he worked in Toronto for upwards of four years, then went to Elmvale for about a year and back to his home town, Port Perry, at which place he labored for over eight years.

Mr. Roberts is well versed in many branches of rural sanitation and has installed innumerable water supply systems and complete farm sanitary equipments.

Mr. Roberts has given considerable thought to improving the local water works system and hopes to see the town install a couple of large steel pneumatic tanks to furnish the town with water under air pressure. His plan is a very good one and the only one that can be properly protected from frost and assure a real good water service for Otterville.

REPRODUCED "SANITARY ENGINEER" EDITORIAL.

In a recent issue of the Ottawa Citizen, prominence was given to a reproduction complete of the editorial appearing in Sanitary Engineer, entitled "Saving Fuel Waste."

He is not only a good practical man but is somewhat of a sport, being a member of the bowling club, and a very able angler. Mr. and Mrs. Roberts are seen posing before the camera man and holding one of the "poor fish" they have landed. He is a real sport, greets each and every one with a pleasant smile and if any one of the readers of Sanitary Engineer happen to call on friend Roberts he will as likely as not invite them to have their lungs tested. The writer didn't bite, because of the fact that he had done so in the years of long ago. It is one of those lung testers which is liable to blacken one's countenance.

MUST NOT USE POST OFFICE STAMPS

(Continued from page 13)

in court or before any trustee under the Bankruptcy Act, of an unstamped receipt, notice shall be taken by the judge or other official of the omission and the receipt may, upon payment to the judge of a penalty of twenty dollars, be received in evidence. It is provided definitely that except as provided in the foregoing, a receipt liable to taxation under this section shall not, except in criminal proceedings, be given in evidence or be available for any purpose whatsoever, unless it be duly stamped in accordance with the law in force at the time when it was given.

Instructions issued to collectors regarding stamp tax on receipts of ten dollars and upwards, provide that effective from August 1 letters including form letters forwarded by mail, also postcards acknowledging the payment of money of ten dollars and upwards are subject to the stamp tax on receipts. The regulations as formerly outlined in Sanitary Engineer, eliminating from tax counter sales slips and cash register tickets, provided they have no words on them implying or stating acknowledgment of the receipt or the payment of money; the taxing of payrolls, individual freight bills and periodical statements of same, customs house brokers' receipts, insurance policies, receipts drawn out of Canada but not valid until countersigned in Canada, etc., are little changed. Voucher cheques and cheques with receipts endorsed thereon, when drawn upon or addressed to a bank are not taxable as receipts. Neither is remitter's counterfoil, being part of a taxable express money order, taxable as a receipt.

Shows That Plumber is Entitled to Fair Profit and Not Charity

Maritime Plumber Keeps List of Those Planning on Building and Gives Them an Active Follow Up—Makes No Excuse for Wanting Fair Profit—Completed Jobs Used as Advertisement to Prospects

"THE only way I know to get business is get out after it," says A. L. Haley, a maritime plumbing and heating contractor. "I keep a list of all persons who plan on building houses for their own use. Just as soon as I get an addition to the list I call around on the man or woman, or perhaps both. I point out that I am capable of installing plumbing and heating systems and refer to work I have done for people who built their own homes. If they decide, as they usually do that they will take some time to think the matter over, I allow them some weeks, and then I get in touch with the parties again. This time I bring charts showing some of the work I have completed in the neighborhood, and also bring testimonials from several of those I have filled contracts for.

"I go over the details, showing how money can be saved by using certain kinds of material, and suggesting things here and there. I take the house-owners entirely into my confidence, telling them frankly I must have my profit. There are some contractors who try to create the impression they are working for charity. But I believe charity begins at home and any person who believes cheap work is worth the money is an oddity. Very often I have some trouble with the women—wives or mothers or sisters or daughters of the men who are having the houses built. Women are not always reasonable. Any man knows that. As I have been married for twenty-five years and have daughters I realize that we must put up with a great deal from the dear ladies. I have had women ask

for a contract price just half what I asked.

"Taking the parties closely into confidence I name the different materials I will use in the contract, and what fixtures I will install if I get the contract I am after. If that does not get the contract, I leave and persuade one of my clients to call on the prospect, and tell him the class of work we do. I have not found much difficulty in getting some of my former customers to do this for me, as in the past I have tried to fill all my contracts as efficiently as I could, and if anything proved defective I made it right before I called the contract completed. So, because I treated all my customers properly, all I have asked have

(Continued on page 21)

The use of attractive groupings of sanitary and heating equipment combined with well-written showcards bearing effective messages are shown herewith as used by W. G. Borland, plumber of Montreal. For the hot weather one card asks: "Hot? Buy a shower and be cool." Others point to the danger of sickness from faulty plumbing, and with the position the plumber holds in the community.

Tinsmithing and Sheet Metal Work

Patterns for Round Torpedo Dash Hood

Written for Sanitary Engineer by O. W. KOTHE, Principal St. Louis Technical Institute

THE dash hood of an automobile is made in a variety of designs, although they do not permit the variety of creations which the rear body permits. Still these dash hoods can be designed to give grace and utility.

In our drawing, the top body of dash hood forms a uniform curve, described with radius R and r.

It is best to first draw the side elevation, making the points in side elevation as 1-3-5-7-9, etc., to base line.

Then with dividers pick the lines, as 1-2; 2-3; 3-4; 4-5, etc., from plan and set the solid lines on top of diagram, and the dotted lines on the bottom of diagram.

This gives the points on the vertical line, and when over to heel of elevation thereby establishing points the height and length, also curve 1-13 to suit conditions.

After this, detail the front end elevation to suit the width of car, and height of side elevation.

Divide each curve in equal spaces as 1-9 and 2-8. Join these points with lines,

thus dividing the flare into triangles as shown.

From each point in the heel as 1-9-14, project lines 1-3-5-7-9, etc., in side elevation.

Observe this gives the altitudinal heights, or in this case the lengths from front to curve.

To find the true lengths, drop lines from each of lines are drawn to those corresponding points in horizontal line. This gives the true lengths as shown.

Now observe the heel of end view is not correct girth, nor is 1-9-13 of side elevation a true girth. Hence we have to develop one.

Pick the spaces, as 1-3-5-7-9, etc., 13 from side elevation, and set as 1'-3'-5'-7', etc., above end view.

Square out stretchout lines, and erect lines from all points in heel of end view.

Where intersections are made as at 3"-5"-7", etc., trace a line and you have the developed girth.

To set out the pattern, draw any line as 1-2 of elevation, for the small end pick the girth from the spaces 2-4-6-8, etc., of end view.

But for the large end, pick the girth from the developed girth as 1'-13" and set as 1-13 in pattern.

Pick true length 2-3 and using 2 in pattern as centre, cross arcs in point 3. Then pick true length 3-4 and using the new point as centre, cross arcs in point 4. Then strike arcs as at 5 and 6, and cross these arcs with true lengths 4-5 and 5-6.

Repeat in this way until the full pattern is finished. Laps for attaching to the chassis and also for putting the reinforcement bar along the heel are allowed extra.

WILL DISCARD FIFTEEN FURNACES

Kingston, Ont.—The House of Providence is to instal a new central heating plant at a cost of \$30,000. It was heated heretofore with fifteen furnaces but the fuel situation has made a new system necessary.

HAS HELPED DEVELOP CALGARY

Calgary, Alta.—E. J. Young is a Calgarian who has helped a cow-town to become a great city. He came to Calgary in 1900 and started the Young Plumbing Co. in 1902. Since then his firm has equipped most of the large blocks in Calgary and district and he is looking forward to another great building period. He saw the present skyscrapers spring up from what he had known as pasture land and considers that 100,000 population will be passed before many years have gone. "We are on the straight road to another spell of prosperity," he declared.

ENGINEER RECOMMENDS FILTRATION PLANT

Pt. Colborne, Ont.—Reasons why Port Colborne must install an expensive water filtration system in the near future, its probable cost, and the possibility of securing new customers for the purified water, were clearly explained and discussed by Engineer Dallyn of the Provincial Department of Health at a public meeting.

The engineer declared that the Board of Health had been trying to get Port Colborne to improve its water supply since 1916. At that time the reason given for not improving the system was that the government had a scheme which would benefit all the towns along the Welland Canal. The government had such a plan at the time, but did not attempt to put it into action.

Patterns for Round Torpedo Dash Hood.

Stimulating Mid-Summer Business

NAT. T. E. B. SERVICE EVANSVILLE, IND.

Wash day brings work enough without having to pump and carry water. Why not make wash day less exhausting by installing a (.....) Farm Water System?

All the water you need—hot or cold—at a twist of your wrist!

The Mirrors of Selling Street

Don't Let Them Reflect Upon You

By JOHN E. ROSSER in Forbes Magazine

WISE N. HIMER is the super-salesman—the gink who knows all about the Science of Salesmanship but isn't worth a pewter smacker at selling. Expect him to get out and hit the ball like a common plug? By no means! He must stick around and tell the others what he knows.

Nothing less than an encyclopaedia would suffice to include his knowledge; so it is possible here to present but an inkling of his omniscience. He is, among other things, the world's greatest expert at sizing 'em up! Just let him give a prospect the up-and-down and that poor chap's inner soul becomes as public as Tut-an-amen's tomb.

The shape of the chin, the set of the ears, the expression of the eyes, the geography of the back of the neck, the position of the next-to-the-bottom vest button—whether it be weakly drawn in or pugnaciously thrust out—these things enable him at a glance to plumb the prospect's nature, slap on the correct descriptive label, and get set with Chat No. 7-B.

There is just one defect in Wise N. Himer's system of instantaneous classification. They are too much like the old lady's recipe for distinguishing between good eggs and bad ones. She said, as will be remembered, "Put all the aigs in a tub of salt water; and good aigs will either sink or float—I fergit which." If he encountered John D. down at 26 Broadway or up at Pocantico Hills he probably would suspect in him a certain financial knack, but if he saw him in a Bowery bread-line, he might have to let it go at this: "Th's is undoubtedly a face. If the eyes, ears and other features function as per specifications, that is all anybody could reasonably expect."

Of course there are different types of men. It would be foolish to pull on the oldest subscriber of the "Atlantic Monthly," the same spiel that would ring the bell with the man who can name all the front-page beauties of the Police Gazette for twenty years back. Nor would it be well to strike with a prospect who takes three minutes to think of his name the pace that would suit another who needs but two seconds to add four columns of figures abreast. There is a difference in the goods but it doesn't always show in the looks of the package.

Mind Crowded With Piffle

The duffers who don't know much about Salesmanship, but who stupidly turn in the orders, can't use any of Wise N. Himer's clever schemes for cataloging. They are so dumb they have to

wait for the prospect to open up—so that they may learn how he feels about it—then—towards them! They don't bank too heavily upon Wise's idea that a man is a fixed quantity. They say that the man who might give them the brutal razz would become positively sweetish if Mr. Dempsey shoved up the same proposition. Moreover, they say that the well-fed man clipping coupons would be a different bird if encountered hungry and holding a telegram advising him of his wife's elopement with the second chauffeur.

If Wise N. Himer could do the thing he professes, he would find poker far more profitable than selling. As it is, he reminds one of the threadbare touts who sell lists of the sure-shots for fifty cents.

In brief, Wise N. Himer's mind is so crowded with piffle he can't soak up the commonplace facts necessary for the job he is hired to do.

THE reason why none of the late books on the so-called psychology of salesmanship has enjoyed a distribution like that once attained by a certain bartender's guide is that when Eddie proceeding to shake one up he was

working with known ingredients, whereas selling is concerned with human nature—and you know how that is.

Some of the old fogies who sell the things that keep the wheels of commerce going say that the chief lack of most of these illuminating volumes is that they weren't written by Ring Lardner and Irv. Cobb. They had always thought, until they took a squint at these technical treatises, that all that was known for sure about the psychology of selling could be written on a post-card, with ample room left for love and kisses.

But these venerable fossils do seem to be informed as to two things, namely, how to start and what to do next. Therein they are sharply differentiated from G. Howe Footless, who hasn't got far enough along in arithmetic to put two and two together.

Footless is connected with a house—it can't be said that he represents it—that has something to sell and he offers it to persons in position to buy and who, properly handled, would buy. But his percentage column is good only for a laugh because he hasn't learned to furnish sufficient reasons for getting the other fellow to do the thing he wants done, and that, in all probability, he ought to do—which is about all that selling is.

G. Howe Footless might say that all this is very indefinite. It is—painfully so. A would-be playwright once asked Henry B. Miller for the inside info as to the absolutely essential element of a successful play. Henry came back with this: "Something that will supply two hours and a half of entertainment to a theatre audience."

The ability to put facts together and draw a conclusion is said to be the highest faculty of the mind.

Franklin didn't invent electricity—all he did was to figure out how he could harness it up with the payroll. Footless is no descendent of Franklin's. He has no knack for either analysis or synthesis; that is to say, he can't pick to pieces the possibilities of the thing he has to sell or combine them with the needs of his prospect.

Still sticking with the highbrow stuff it will be recalled that in physics the student is taught to compute the resultant of forces. That is, if several forces of varying intensity and different angles of impact strike a movable object it is easy to figure the direction the object will take and the distance it will travel.

Wise N. Himer

**The guy who
is ready to
hang on the
tag when he
has given
them the
once-over**

Selling is precisely like that—and that is why it is so well repaid.

G. Howe Footless gets pop-eyed with amazement at the achievements of real selling men. He thinks they sell with no effort at all, but he doesn't see that without making a ripple on the surface they have quietly seized upon enough motives to shift the prospect—that prospect—from where he was to where they wished him to be. And, to a reasonable certainty, if they could figure all this

G. Howe Footless

The salesman who carries a long pole past an over-crowded apple tree and can't think what to do with it

out in advance of the interview—from a knowledge of the prospect's likes and dislikes—they did so. The battle was at least half over when it started.

Until G. Howe Footless learns the importance of forethought and foresight and dynamic commonsense he had better not lose his appetite for Salvation Army soup.

A. BUSCH LEEGUR loses his nanny every time he whiffs. When he has done his stuff to the last impassionate note, only to find that his prospect has no more intention of monkeying with the dotted line than he has of touching a high-tension wire, he gets the gum-willies and slinks away completely sunk.

When his score-board shows about three goose-eggs straight he makes St. Vitus look as calm as the Statue of Liberty, and decides that since he is a total loss anyway he might as well begin shopping around for cyanide and fare-well hardware. Consequently, if temporarily he decides not to junk his mortal coil and yet, in that blue funk, walks into another wild beast's den, the man he talks to does not buy, of course; but is usually good enough sport to weep on his shoulder and lament with him the harshness of life.

A. Busch Leegur is a perfect example of unstale equilibrium. He lacks a gyroscope beneath his hat. He tells himself that he is the only man who ever drew a blank, in which self-condemnation, therefore, he is 100 per cent. nuts. For the man never lived who sold them all!

The boys who romp out to the diamond from the dog-house at the Polo Grounds are there not because they get them all, but because they get more of them than is customary in the tank-town leagues. The Bambino knows very well that he is going to let some perfectly sweet ones ooze right over the plate, but he is big gate-money because he also knows that under his law of averages he will get his share.

Out of that assurance comes a steadiness of nerve that enables the big-timers to be all set for each of the good ones and thus to stay in the Hall of Fame of .300 or better. A. Busch Leegur never has gotten next to Napoleon's maxim: "It is better to lose a single battle than an entire campaign."

He won't get anywhere until he thus orates:

"My job is selling. If the salesman didn't have a legitimate function he would become, under the law of supply and demand, as extinct as free lunches. As sound a thing as is life insurance, I doubt whether more than one per cent. of it is bought—the rest is sold. I guess people have to be compelled to do even the things they know they ought to do. So I'm going to fire both barrels. I understand in advance that I'm destined for some gosh-awful jolts, and thus I mean to keep my temper and if possible my sense of humor.

"And I'm going to offer my stuff in the belief that I have just as much right to my job as has the man to whom I'm talking. If he pulls the high-and-mighty vamoose on me without taking the trouble to see whether or not he could profit by what I'm telling him I'll bet I'll be on my job long after he has skidded out of his. And I won't be kidded by the fellow who boasts that no man can sell him anything. For such a boast is really the highest possible tribute to selling ability—it means that all that fellow has he got from experts who made it a painless operation. I'm going to get my share."

A. Busch Leegur

The small-timer who never has learned to lean up against the law of averages

Once he meditates earnestly in that vein he will find the scouts on his trail, and no Sunday supplement will be complete that fails to show him whaling one out of the lot.

DEPLERE LACK OF CONVENIENCES

St. John, N. B.—Lack of convenience stations in St. John, N. B., is deplored at the present time when this Eastern city is in the midst of the summer tourist season. Thousands of people from New England and the Eastern states and Upper Canada, accustomed to convenience stations and public shower baths and swimming pools are amazed at lack of these facilities in St. John.

WINNIPEG CENTRAL HEATING

Winnipeg.—Negotiations for the central heating of a portion of south Winnipeg through the activities of a company headed by B. W. Parker have not yet come to a satisfactory conclusion, although it is confidently believed by the promoters that an agreement will be reached shortly. The sub-committee of city council charged with negotiating the agreement with Mr. Parker has met several times recently and some two-thirds of the agreement has now been more or less satisfactorily arranged. The sub-committee has been unwilling to give Mr. Parker the whole of the city south of the Assiniboine and west of the Red River as exclusive territory, but have mapped out a large district in this area. Mayor Farmer has provided some opposition to the scheme, maintaining a dislike to giving away fresh franchises of this nature. Under the plan proposed by Mr. Parker, his company will purchase electrical energy from the city hydro on a ten-year contract, an aspect which has appealed to members of the sub-committee.

Heating and Ventilating Department

Heating and Ventilating Systems in Some Large Schools

Plenum System with Direct Radiation Only in Offices, Corridors, Shops or Special Rooms—Class Room Exhaust System—Calculating Heating and Ventilating Requirements

By JOHN HOWATT, Chief Engineer Chicago Department of Education

IN GENERAL, the Chicago practice in public school heating and ventilation is a plenum system with direct radiation only in offices, corridors, gymnasias, shops or other special rooms. The so-called "split system" of heating and ventilation wherein the heat losses in the class rooms are taken care of by direct radiation in the rooms themselves, with the incoming air warmed to a point where it is suitable for ventilation purposes only, has not been installed in buildings erected in Chicago for some years. It has been the opinion in Chicago that the class rooms are more certain to have ventilation when the heating of the rooms depends upon a predetermined air supply.

In the proper design and installation of any heating and ventilating plant a thorough co-operation between the architect and engineer must prevail in order to avoid having the architect proceed too far with the plans of a building before consideration is given to the proper design of the heating and ventilating system. It not infrequently happens that, boilers, for example, have to be fitted into cramped, out-of-the-way places, so congested that the firemen are scorched in their attempts to clean out the fires, jointed flue-cleaner rods have to be used in punching flues and tubes cannot be removed if they fail by rupture or corrosion; if those who design and install plants in this way were required to operate them the design and installation would be different.

The Chicago Plan

The situation in the Chicago public school system is very favorable because the board of education engineering and architectural staffs work together on all plans, co-operating in every way, and because those who are responsible for their maintenance and operation after installation. This avoids all division of authority and makes for designs that are economical and practical.

The operating engineering force in the Chicago public school system is a well-organized force of men who are represented by committees; these men are invited into the office of the chief engineer to go over proposed plans of new build-

ings and additions with a view of getting the suggestions of these practical operating engineers as to the workability of the proposed designs. It is our belief that in order to induce men to give proper care and attention to mechanical equipment, that equipment must be made readily accessible and proper working space must be provided. The design of the plants in the Chicago public schools is such as to give ample working space in all boiler, engine and pump rooms.

Boiler Plant Design

There are over 800 high-pressure boilers in use in the Chicago public schools at this time. About 100 of these boilers are water-tube boilers and most of the remainder are standard return-tubular boilers. A typical Chicago elementary school consists of a three-story building containing 32 class rooms, assembly hall, gymnasium, offices, etc. (Fig. 1). This size of elementary school building is duplicated oftener than any other. The typical boiler room equip-

ment for such a building consists of three 66 in. by 18 ft. standard horizontal-return tubular boilers with shaking grates for hand-firing. For plants of this size it has been found that this boiler is easy to keep clean and easy to repair.

The boilers are set with what is known as the Chicago Smoke-Department No. 8 furnace setting, consisting of brick bridge walls, wing wall piers and deflecting piers. This setting is efficient and the upkeep cost is low, but has the objection that with this setting it is difficult to eliminate smoke. This city is located in a territory where all of the larger plants burn the lower grades of bituminous coal mined in Indiana and Illinois.

If constant efforts are not made to minimize smoke the city would be covered with a cloud of filthy soot. School plants are especially difficult to operate without excessive smoking, because boiler settings are cold when the plants are started up in the morning, and because the load tapers off so materially after the first few morning hours, giving an excess boiler capacity with corresponding low furnace temperatures.

All of the boilers in Chicago public schools are equipped with high-pressure steam jets over the fire doors which are very useful in mixing the gases of combustion before they pass over the bridge walls and assist in cleaning smoky stacks. Experience here, however, has shown that the best furnace for use in

Caused a Big Stir

IT IS interesting to note the signs of progress being made in certain heating circles and particularly to note that in some centres warm air heating installations for larger buildings are becoming more popular. In fact the new building code in one city now calls for 6 inch studs in new buildings. This is another evidence that warm air furnace systems are to have a better chance to show what they can do in large homes. The use of fans in connection with such installations is becoming more general. This building code is as follows: "The following provision shall be made in any building wherein the warm-air heating system is to be installed for the reception of the same. Joists shall be placed 16 in. on center and shall be butted, not lapped. New stud partitions wherein stacks are to be run shall be made at least 2 x 6 in. studding placed to give a clear space for the stack of not less than 14 in. It shall be unlawful to run any heating stacks in any new partitions constructed thinner than 5% in. in width of studs."

This new regulation will mean better warm air furnace installations and give this type of heating a better chance to show what it can do in large homes.

Impressing the Public

NOW that there has been a change in government in Ontario, it is to be hoped that the new government will see the necessity of taking steps to bring into force the new set of proposed plumbing regulations on which a number of Ontario sanitary engineers spent much time and thought. These proposed regulations took definite form under the Hearst Government in Ontario, and authorities agree that a more up-to-date set of regulations is hard to find anywhere on the continent. There has been some talk of politics having held the matter in abeyance during the regime of the Drury Government in Ontario, it being felt by some that the proposals were regarded as radical by certain sections of the rural districts, but the fact remains that after having passed certain stages of committee the proposals were allowed to drop and were pigeon-holed by the Minister of Labor in the late government throughout his entire tenure of office despite the active efforts of officers of the Ontario Society D. S. & H. E., to bring it before the House. The need for such regulations is daily becoming more evident. As long as no such regulations exist every property owner or tenant will go the limit in doing his own work and the community will have to stand in the danger of this condition. Good sanitation and properly installed heating systems are two of the greatest boons to modern civilization. We have had enough experience with

what they can be when not properly handled. Sanitary engineers are experts at their line, and supporting such movements actively shows that they are on the job to help impress the public with the importance of their industry.

Not a Luxury

THE old cry that up-to-date bathing equipment in the home is a luxury is not dead yet; it continues to crop up, sometimes in the most unexpected places. This amazing contention was advanced in the course of a discussion on Housing, in Committee of the British House of Commons recently. Those who contend that bathing is a luxury belong to the peculiar school of thought which frowns upon every progressive step in civilization and resolutely condemns higher standards of life, holding improvement to be a form of impiety.

Fortunately this type of individual is becoming more and more in the nature of a unique survival from ruder and less enlightened days and although occasionally we may talk of the "good old times" with fervent reverence, we never follow up our thoughts of the past to a logical conclusion; if we did we should realize perhaps more vividly than we do, the enormous list of benefits which the average man enjoys to-day compared with those times. The bathroom as an apartment in the house has gained a position of definite importance; it cannot be ignored and swept aside labelled as a "luxury." Were this to become the common opinion the standard of comfort and convenience in the home would be much lowered.

"Reds" Cannot Run Canada

WHENEVER the head of Bolshevism raises itself in Canada it must be smitten down.

The strike of the miners and steel workers on Nova Scotia has continued in the face of all authority—in defiance of the federal and provincial governments and in defiance, too, of the constituted labor leaders of the workers themselves. Whatever the merits of the case as between the men and the company which led to the break, they have been lost sight of in the issue of whether an industry which is an important factor in the well-being and safety of the nation is to be controlled by constitutional methods or to be directed by the Reds from Moscow.

Professional agitators in the name of Trade Unionism and the workers of Canada are demanding, with much bluff and noise, the withdrawal of military and police protection for lives and property in Nova Scotia coal and steel fields with such skill that some government officials, thinking it is the voice of the country, have been apologizing for being forced to do their duty.

It might be well for these officials, who often mistake noise for public sentiment, to note the voters of Canada, including the workers themselves, are so unsympathetic with the professional labor element that not one real Trade Unionist was elected in all Canada.

If strikers behave themselves they need have no fear of Government troops or police officials. There is no room for Reds in Canada.

There is a wide diversity of terms among manufacturers. Some quote 5 per cent. thirty days, others 3 per cent., some sixty days net, etc. The merchant cannot be expected to guess as to what are the correct terms, and it is up to the manufacturer and jobber to see to it that the exact terms are on every invoice rather than the words "terms as usual."

Co-operation Series

The New Peddler

Organization Made Him—Co-operation Will Defeat Him

*T*HERE'S only one way to get ahead of this fellow and that's to do what he does—only better.

You can take his place just as he took the place of the old time peddler.

He uses organization, so can you; he wins and holds the confidence of his customers, so can you; he offers assortments that please and guarantees satisfaction without argument, so can you in connection with plumbing fittings, specialties, etc.

He talks a great deal about price; but when delays, damages in shipment, disappointment in quality and more delays, are considered the difference in price is not equal to the service and satisfaction you can give—if you will.

Join hands with your local merchants, offer wider assortments through co-operative advertising; build confidence by guaranteeing satisfaction; take a genuine personal interest in the desires of your customers and you need not fear this "Peddler."

Co-operation will defeat him.

THINK IT OVER --APPLY IT TO YOUR BUSINESS

in the Plumbing Trade in Canada.*

News Notes From Coast to Coast

NEW FIRMS

St. John.—Crawford and Hooper have opened a plumbing and heating contracting business in St. John, N. B. A store and office, combined, has been opened on Union Street in St. John.

WINDSOR PLUMBING INSPECTOR QUILTS

Windsor, Ont.—Plumbing Inspector A. Ross has resigned and will go into business for himself. Mr. Ross was appointed to the position on his return from overseas four years ago.

TO INSTAL HEATING PLANT

Chatham, N. B.—A central heating plant is to be installed by the Sisters of Hotel Dieu for the heating of all their buildings. A new building will house the boilers, thus decreasing fire risk.

NEW MONTREAL COMPANY FORMED

Montreal, Que.—Announcement is made of the formation of the firm of Stanley Brock, Limited, with headquarters in this city. Mr. Brock, and T. C. Cunningham who is associated with him, will act as Quebec and Maritime agents for the Standard Sanitary Manufacturing Co., Toronto; Galt Brass Co., Galt; and Fred Somerville & Co., Toronto.

BUSINESS UNDER NEW NAME

The business formerly known as Moulson-Buchanan, Limited, plumbers' supplies, 40 King Street East, Toronto, is now being carried on under the name of J. L. Buchanan, Limited, at the same address. J. L. Buchanan is president of the new company and W. J. Stephens is secretary-treasurer. They will continue to specialize in English vitrolite and vitreous china, manufactured by John Slater, Limited and Geo. Howson and Sons, of Hanley, Staffordshire. Mr. Buchanan has just returned from England where he has been assured of adequate supplies and prompt shipments for the coming season.

HAS PLUMBING CONTRACT

St. John, N. B.—W. B. McDonough has received the contract for installing the plumbing and heating systems in the additions to the Germain Street Baptist Church of St. John. Construction of the additions has been started.

Schools have also been one of the leading source of revenue for local plumbing and heating contractors. In St. John, the following school plumbing and heating contracts have been filled or in process of filling: Albert School, St. Peter's School, Holy Trinity School, St. John the Baptist School. These contracts have been issued this year.

Doings in the Plumbing and Heating Industry

PLUMBING FIRM IS INCORPORATED

Moncton, N. B.—Incorporation of T. H. Cochrane and Co., Ltd., of Sackville, is announced. The company is authorized to take over the general business as plumbers formerly conducted by T. H. Cochrane. The members of the new firm are T. H. Cochrane of Sackville and George V. Steeves and John H. Cochrane of Moncton.

SARNIA PLUMBERS HELD PICNIC

Sarnia, Ont.—The plumbers of the town held a highly successful outing when they motored several miles up the shore for their annual picnic, putting on a fine programme of sporting events and topping off the day with a banquet under the trees. In a spirited baseball match between the plumbers and the electricians, the former were declared the victors. Wm. Barrie carried off the quoiting championship, defeating Alex. Joss in the finals.

OUTSIDE CLOSETS NOT TO BE ALLOWED

Peterboro, Ont.—The city's campaign to get rid of all outdoor closets is being carried on actively this summer. At a

J. E. NEWSOME

Eldest son of Edwin Newsome, contributing editor of Sanitary Engineer, who, as announced in July 1 issue of Sanitary Engineer, has been appointed to the sales department of Williams Tool Corporation of Brantford, Ont.

recent meeting of the Board of Health, owners of thirteen houses were notified that they must comply with the Board's programme of improved sanitation.

HANOVER WILL INSTAL CHLORINATOR

Hanover, Ont.—A chlorinator, to be used in purifying the water supply of the town, has been purchased and will be installed immediately.

SCARBORO RATEPAYERS WANT SEWAGE SYSTEM

Toronto, Ont.—Plans for a sewage disposal system for Scarboro township were discussed at a meeting of the Victoria Park Ratepayers' Association. It was decided to ask the members of the Township Council to attend the next meeting of the association to discuss the matter.

EDMONTON GETS GAS SERVICES

Edmonton, Alta.—Installation of gas services in homes throughout this city have been started, according to announcement made by R. G. Hill, general manager of the company, following the arrival of pipe and other equipment from Ontario and Ohio. Application for services continue to come in at a good rate. The towns of Viking and Tofield are also making arrangements to secure the natural gas service from the local company.

CONSTRUCTION WORK AT OWEN SOUND

Owen Sound, Ont.—Contracts to the extent of \$115,000 have been let to four different firms for the sewer, curbing and paving work to be done here this summer. J. E. Russel Co., Ltd., Toronto, will supply the sewer pipe at \$10,000; F. F. Fry Ltd., the sewer construction work at \$40,000; W. L. Nelson, Stratford, the curbing for \$12,000 and the Warren Paving Co. have contracted to carry out the paving programme for \$53,000.

CONTRACTORS RENEW CRACKED PIPE

St. John, N. B.—The Canada Lock Joint Co., contractors for the new 36 inch reinforced concrete water main from Spruce Lake to Manchester's Corner, are renewing about 1,200 feet of the pipe which was shocked and cracked by the sudden turning in of the water when the pipe was first tested out. This will be in addition to about 900 feet renewed last week. The work is being done at the expense of the company under their maintenance bond.

PROVINCIAL BOARD TO INVESTIGATE

Woodstock, Ont.—Frequent complaints made by west end citizens of the offensive odors which are arising from the city's sewage disposal plant, installed some time ago on the orders of the Provincial Board of Health, have resulted in an investigation which is to be made shortly by Inspector De LaPorte of the Provincial Board.

MADE ANNUAL INSPECTION TRIP

Winnipeg, Man.—Members of the City Council and of the suburban municipal councils have completed their annual inspection trip over the Greater Winnipeg water district railway. They inspected the intake plant at Shoal Lake and the prison farm during the course of the trip.

KITCHENER HOSPITAL CONTRACT AWARDED

Kitchener, Ont.—The contract for the general construction of the new St. Mary's Hospital has been awarded to W. M. Sutherland Co., Ltd., Toronto, the price being \$258,000. Tenders for heating, plumbing and wiring will be opened later.

INCINERATOR CLAIMED NECESSARY IN HAMILTON

Hamilton, Ont.—Frequent complaints regarding the condition of the west-end dump make an improvement of the city's garbage disposal system practically a necessity, City Engineer W. L. McFaul reporting that the only solution of the problem lay in the installation of an incinerating system.

LAST LINK OF WATER MAINS IS COMMENCED

Vancouver, B. C.—"Pulling" of the two big water mains across False creek in order to complete the last link in the Point Grey partnership watermain has been completed, said E. M. LeFluffy, waterworks engineer.

This main will supply the city and Point Grey with more than 4,000,000 extra gallons of water and will be Greater Vancouver's safeguard against a water shortage this summer.

FILTRATION PLANT KEEPS WATER CLEAN

Lethbridge, Alta.—While the people of Calgary and Edmonton, as a consequence of the floods, were drinking and washing in water thickened with mud, the people of Lethbridge, with just a suspicion of mud in the water a day or so ago, were revelling in aqua pura of crystalline appearance. To this they owe thanks to the filtration plant built in 1917 at a cost of \$100,000. The filtration plant has had the opportunity of being tested with the recent flooding of the river, and, taxed to the limit, has come out with colors flying after the trial.

MAY INSTALL WATERWORKS SYSTEM

Durham, Ont.—The Town Council is securing advice on the installation of a waterworks system for the municipality. There are three sources of supply, the river, Wilder's Lake and springs in the hill north of the town. The latter are likely to be utilized at a probable cost of \$36,000.

NEEDS ANOTHER MILE OF SEWERS

Fort William, Ont.—The construction of at least another mile of sewers is necessary in the coal dock area of the city before sanitary conditions are anywhere near ideal, according to a report submitted to Fort William city officials by F. A. Dallyn of the Sanitary Engineering Commission which held a sitting here some time ago.

F. C. PALMER GOES TO BOWMANVILLE

Oshawa, Ont.—F. C. Palmer, who was for many years engaged in municipal work in Oshawa and until a few months ago as Sanitary Inspector, has received official notification of his appointment as Town Engineer and Street Commissioner for the town of Bowmanville. The appointment was made at a special meeting of the Bowmanville Town Council, after many applications had been considered.

Mr. Palmer is a member of the Royal Sanitary Institution, London, Eng., where he graduated in sanitary engineering. He has an overseas record of three and a half years, and prior to enlisting was acting as Sanitary Inspector and Assistant Town Engineer in Oshawa.

F. C. PALMER

Formerly sanitary engineer of Oshawa who becomes Town Engineer of Bowmanville, Ont.

TO INSTAL DRINKING FOUNTAINS

Victoria, B. C.—The city engineer has been asked to prepare a report on the cost of installing drinking fountains in Beacon Hill Park, following action in this respect taken recently by the City Council.

REDCLIFFE IS WITHOUT WATER

Medicine Hat, Alta.—The town of Redcliffe is without a water supply as the result of the power plant there being struck by lightning and totally destroyed during a recent storm.

NEW WATER SYSTEM AT PORT CREDIT

Port Credit, Ont.—The new water system for the town has reached completion, tests having proven the installation to be satisfactory and in shape for use. The installation was made at an approximate cost of \$110,000.

MUST IMPROVE SCHOOL SANITATION

Hamilton, Ont.—One of the problems facing the Board of Education of this city is the improvement of the sanitary conditions at Murray Street School. Most of the board favor the erecting of a new school in that part of the city but this step is dependent upon the securing of land from the C. N. R. and the immediate improvement of sanitary conditions at the school is urged by the Board of Health.

WESTON CONTRACTS AWARDED

Weston, Ont.—The Weston Water, Power and Light Commission has awarded contracts totalling approximately \$27,000 for material and work in connection with the installation of an extension of the town's water system. The contract for trenching, laying of water pipes, filling in and jointing went to J. Cavotti, of Toronto, at \$5,597.

UNSUCCESSFUL BIDDER LIKELY TO APPEAL

Levis, Que.—It is likely that T. E. Rousseau, Quebec contractor, will appeal to the courts against the decision of the Levis City Council to award the contract for a new filter to the Smith Co., of Montreal. This company's tender amounted to \$154,306 or \$132,000 if the city was willing to construct the foundations of the plant, while the Rousseau company had tendered for the work at a total cost of \$140,010, about \$14,000 under the Montreal tender. Rousseau was eliminated on the grounds that he had never before constructed a filter. It is pointed out that while it is true that the firm, which is a comparatively new one, has never constructed a filter, the two engineers of the company, Messrs. Arsenault and Plamondon, constructed a filtration plant at Pointe

THAT'S SO!

"Your advertisement describes this as all wool. It is nearly all cotton."

"Yes, that's the worst of the newspapers. You can hardly believe a word they say."

KNOW THEM TOO WELL

The president of a small college was visiting the little town that had been his former home, and had been asked to address an audience of his former neighbors. In order to assure them that his career had not caused him to put on airs he began his address thus: "My dear friends,—I won't call you ladies and gentlemen—I know you too well to say that."

GOT TWISTED

An Irishman being awakened suddenly in the night by a cry of fire hastily donned his trousers and leaped from a second-story window. He alighted safely on the ground, but stood looking down at his trousers, which in his excitement he had put on hindsides before.

A fireman came up to him and said: "Did the fall hurt you, Pat?"

"No," said Pat. "Divil a bit did it hurt me, but it gave me a divil av a twisht."

RESPECT

Jack—"I noticed you got up and gave that lady your seat in the street car the other day."

Herb—"Sure, since childhood I've always respected a woman with a strap in her hand."—H.M.

IN A NEW SENSE

"Bill," said a sailor looking up from his writing, "do you spell 'sense' with a 'c' or a 's'?"

"That depends," replied his friend. "Do you refer to money or brains?"

"Aw, I don't mean either of them two," was the reply. "What I want to say is, 'I aint seen him sense'."—H.M.

HOW 'BOUT THIS

A negro went into a general store in a Southern town, ordered some supplies and asked the storekeeper to trust him for it.

"How's that, Sam, you ought to have money. You just sold your cotton up in Memphis."

"Ah ain't got no money boss, de ducks got it."

"What have the ducks got to do with your money?"

"Well, when Ah gets de paper from de man in Memphis it says—Deduct fo freight, Deduct fo truck, Deduct fo warehouse an' when de ducks got done Ah ain't got nothing left."—H.M.

OUTDOING EINSTEIN

An Irishman was handling dynamite in a quarry. He let a stick drop, and the whole box went up, taking Mike with it. The quarry boss came around later and said to another Irishman:

"Where is Mike?"

"He's gone," replied Pat.

"When will he be back?" asked the boss.

"Well," replied Pat, if he comes back as fast as he went, he'll be back yesterday."—H.M.

A GOOD TIME

She: "Yes, we had a splendid time last summer. Four other Vassar girls and I took a tramp through the Adirondacks."

He: "Did the tramp have a good time?"—H.M.

THE OTHER FELLOW NEVER HAS

Engineer—"Well, Dan, we decided at the meeting last night to strike. Why wasn't you there?"

Fireman—"I couldn't get there on account of the trolley strike. Them trolley men ain't got no consideration for the public."

INFANT TERRIBLE

Caller (to hostess's little boy)—Why are you looking so intently at the cat?

Boy—Mother said your new hat was enough to make a cat laugh and I'm waiting for it to start.—H.M.

KNOWS THEIR HAUNTS

One day while a farmer and his men were digging potatoes, a tramp came along and stopped to watch the workers. The boss, being short of help, asked the vagrant if he wanted a job.

The man of leisure replied, "Sure! What do I have to do?"

"Dig potatoes."

The tramp started to walk away, and with a look of disgust replied, "Let the man who planted them dig them. He knows where he put them."—H.M.

MATTER OF FORM

Tourist (in village Notion Store)—"What-d-dya got in the shape of motor car tires?"

Saleslady—"Funeral wreaths, life preservers, invalid cushions and doughnuts."

Does Something Else Besides Good Plumbing and Heating Work

A. M. Roberts, popular sanitary and heating engineer of Otterville, Ont., tells in this story of an opportunity which he has made best use of. Apart from business he is a splendid angler, as is here shown. It takes both him and his wife to hold up this miniature whale. He has extended an invitation for Sanitary Engineer readers to visit him when in the district and "have their lungs tested."

No Plumbing Facilities In 389 Winnipeg Houses

Winnipeg, Man.—The annual report of the Medical Health Officer of this city for 1922 contains the important information that there are to-day only 389 houses in the entire city in which there are no plumbing facilities and in which the occupants are using outside closets. This small number in a growing city the size of Winnipeg is particularly gratifying when it is recalled that just ten years ago the total reached 1,041.

One of the objectionable features noted in the report is that with the housing shortage in the city, many houses which were originally intended for one family are now being used as tenements with a number of families each occupying but a room or two. This means that five, six or more families are frequently found in houses served by but a single water closet and without any sinks whatever.

BUILDING

Chesley, Ont.—A central heating plant is to be installed at the Bruce county buildings at an approximate cost of \$15,000. An addition is also to be made to the council chamber of the County Council at a cost of \$8,000. At the present time six boilers are necessary to heat the buildings.

Asks re Difference in Pressure

Editor, Sanitary Engineer:

What would be the difference in pressure between a 2 in. pipe running one mile, and a 6-in. or 8 in. pipe running from the same spring to the same house? Is there a table or rule for showing this?

A. E. Rawlings,
Ayers, Cliffe,
Que.

Answer:—Re difference in pressures of water is a question that could not be answered unless more information is available.

First the depth of water available at the spring, the height of water in the spring and the fall allowed for the pipe line. The question as to whether or not the pipe line would be laid in a straight line free from bends, or if there be any such bends, the radius of same.

Regarding tables, there are some such tables, all arrived at by a standard formula. These tables are very long and would be too cumbersome to publish.

AN ATTRACTIVE CATALOG

Shanks & Co., Ltd., Barrhead, Scotland manufacturers of vitreous lavatories, porcelain urinals, closet tanks, etc., specially designed for the Canadian trade, have just issued an attractive catalog containing twenty pages. These goods are sold through recognized jobbers throughout Canada. Canadian agents for Canada and W. H. Cunningham & Hill, Toronto.

Asks About Sweating Chimney

Sanitary Engineer,
Toronto.

Would you please give me information if possible in regards to a chimney that sweats?

I installed a furnace in a new house, double flue chimney with a 10 inch tile for the furnace flue. As soon as you start the fire it commences to run and will sweat on an average of two eight quart pails a day. I might say that the space between the tile and brick is filled in solid with mortar. Could you kindly give me some advice as to what to do to remedy it?

Yours truly,
D. RODNEY.

* * * *

Answer: We are almost at a loss to know how it would be possible for a chimney to sweat 16 quarts of water per day. In all the writer's experience of nearly 30 years, such a condition was never heard of. We do know, however, that pipes will very often sweat when first starting a fire and particularly a new chimney. But not to the extent of 16 quarts a day. It is quite possible for this to occur one day, and then not so much each day after until the chimney has got thoroughly dried out.

We would suggest that our inquirer examine the chimney very carefully and see if there are any cracks or crevices through which melted ice or snow or water can leak into the chimney at a valley, gutter or chimney flashing. This, we think, must be the cause of the trouble.

It is quite possible, too, that such a condition could develop where the smoke pipe from the furnace to the chimney is exceptionally long and passes through a cold damp room, such a pipe would sweat, but by no means to the extent of 16 quarts of water per day. We would like to know just what conditions are found after a more minute inspection.

DEEP WELL PUMPING INSTALLATIONS

The Duro Pump and Manufacturing Co. of Dayton, Ohio, have issued two new folders for distribution to the plumbing trade. One of these folders illustrates and describes their deep well water pumping outfit. This folder is got up in two colors and describes the different places where this installation can be used.

The other folder which is also ready for distribution describes the Duro System of soft water installations, and should be of great assistance to the dealer when selling these lines.

"I am selling adding machines," announced the new travelling salesman to the country storekeeper. "I have the best adding machine on earth. It will add any number of figures accurately."

"Reckon I don't need one," replied the storekeeper, shifting his seat on the cracker barrel.

"But, man, how else can you keep up with things?"

"Wal, I got a plenty good enough system. I cut a notch on the counter every time I make a sale."

Twenty Years Ago

Following items reproduced from trade newspaper files of MacLean Publishing Company of July, 1903:

"The Standard Ideal Sanitary Co. after a survey of the field have decided to establish works at Port Hope, Ont. Now a handsome brick structure occupies a commanding position near the mouth of the harbor. The company is incorporated with a capital of \$100,000, all the stock being held by Detroit and Cleveland capitalists. The president and manager H. T. Bush is manager of The Ideal Mfg. Co., of Detroit. S. A. Sloman is vice-president, J. R. Sprankle is secretary-treasurer and A. E. Pipher superintendent."

"The eighth annual convention of the National Ass'n. of Master Plumbers, Steam and Hot-water Fitters of Canada was held in Montreal, July 1, 2 and 3, at the Forsters' Hall, 505 Craig St.

"Complimentary tickets were presented to the delegates to witness the championship lacrosse match between Shamrocks of Montreal and Brantfords of Brantford, Ont. T. O'Connell, captain of the Shamrocks, is president of the Montreal Master Plumbers' Ass'n.

"H. Mahoney, chairman of Credential Committee, reported the following members eligible to sit as delegates: Past-president J. McKinley, Ottawa; President F. Powers, Lunenburg, N.S.; Vice-president P. C. Ogilvie, Montreal; Treasurer J. Lamarche, Ottawa; Secretary J. Pascoe-Beel, pro tem; Provincial Vice-presidents, Ontario, W. H. Meredith, Toronto; Quebec, J. Thibeault; Nova Scotia, Geo. Kinsman; New Brunswick, W. Watson, Moncton; Cape Breton, J. D. Chisholm, New Glasgow; British Columbia, H. Mahoney, Guelph, Ont.; Manitoba, R. Ross, Toronto; Ontario Provincial Ass'n., L. Le Grow, Toronto; G. Cooper, Toronto; F. Maxwell,

Toronto; F. Armstrong, C. E. Pickard, both of Toronto; H. A. Knox, Ottawa; J. G. Johnson, Ottawa. Local Associations: G. Ross, Brockville; T. O'Connell, Montreal; J. Gordon, T. Moll, J. Watson, Montreal; J. A. Wooten, Halifax; D. Shea, Fredericton, W. G. Butler, Perth, Ont.

"Among the representatives of supply houses present were the following: Alex. Brenner, The Fairbanks Co., Montreal; H. McLaren, P. J. Lockhart and J. F. L. Carson, The Gurney-Massey Co., Montreal; P. McMichael, Dominion Radiator Co., Toronto; P. E. Rouillier and John Cartind, Star Iron Co., Montreal; F. J. Travers, Canada Radiator Co., Port Hope; James Robertson and Mr. Mackenzie, The Thos. Robertson Co., Ltd., Montreal; W. P. Baxter, The F. W. Webb & Co., Montreal; W. M. Snair, Son & Morrow, Ltd., Halifax.

"At the annual banquet, Peter McMichael made a brief address and responded good naturedly to the request for a song, which he rendered in good style. Fred Armstrong, Toronto, proposed the toast of 'The Ladies.' All who know him know that full justice was done to the toast."

"A meeting took place at the Canada Radiator Co., Montreal, to form an association of the manufacturers and supply men to assist the work of the National Association of Master Plumbers."

"The threatened dispute between master plumbers and plumbers' union in Winnipeg has been settled, the rate of wages to be 50 cents per hour, second-class men 25 cents and up."

"Plumbers have so much trouble with stop cocks wearing out that Morrison Patent Stop Cock has been perfected, constructed with a spindle and holder containing a soft rubber disc and a brass washer between this and the bibb washer."

Some of the Old Brigade. Group photo taken by Sanitary Engineer of the delegates to the 8th Annual Convention of the National Association of Master Plumbers. H. Mahoney, of Guelph, still active, is second from the left in the front row. Others mentioned in the report will be seen in the group.

Keeping Business Men Informed

Many Distant Canadian and United States Centres Visited Periodically by Representatives of Specialized Business and Technical Papers.

SPECIALIZED business and technical papers in Canada are doing a great work for Canadian industry by collecting the ideas and methods of outstanding men and passing them on to their respective trade or technical industries.

During recent weeks for instance, the various publications of The MacLean Publishing Company have had men in many parts of Canada attending conventions and gathering business information, as well as in a number of United States centres where conventions of international importance have been held. The fact that so much time and money is spent on gathering and publishing information of this kind illustrates the service the men in charge of these papers are putting into them.

At the present time H. T. Hunter, vice-president of the company, is studying conditions in Europe. During May the editor of Canadian Foundryman and three other members of the staff attended the American Foundrymen's Association Convention at Cleveland, Ohio. A member of the staff of Canadian Machinery attended the convention of the American Society of Mechanical Engineers, held recently in Montreal. The same publication had several representatives in attendance at the convention of the Canadian Association of Stationary Engineers in Toronto.

The editor of Printer and Publisher was present at the convention of the Weekly Newspapers' Association in Halifax a couple of weeks ago, and in August will attend the Printing House Craftsmen's convention in Buffalo.

In June the annual convention of the Saskatchewan Retail Merchants' Association was held in Prince Albert. This was attended by the Winnipeg representative of The MacLean Publishing Company. Another representative attended the annual convention of the Ontario Branch, Retail Merchants' Association, at Brockville. Representatives of Hardware and Metal attended the convention of the Ontario Retail Hardware Association, as well as other provincial retail association meetings and also many hardware and paint club meetings in towns and cities throughout Canada. Sanitary Engineer representatives attended conventions of the Ontario and other provincial organizations of master plumbers, also many local association meetings in Toronto, Hamilton, St. John, Montreal, and other cities. Bookseller and Stationer representatives attended the annual meetings of the Canadian and American associations.

The editor of Men's Wear Review was at the recent convention in Toronto of the Association of International De-

signers, and in Cleveland of the International Association of Display Men. The editor of Druggists' Weekly attended last week the annual convention of the Ontario Retail Druggists' Association. A Canadian Grocer representative went to St. Andrews, N. B., a short time ago, to attend the annual gathering of the Canadian Wholesale Grocers' Association. The Financial Post has had staff men in leading centres of the Maritime provinces and Newfoundland within the past few weeks, as well as in Western Canada, and three of them have just

returned from a trip through the mining districts in Northern Ontario to study the mining situation more closely. One has just returned to our Montreal headquarters from a trip to Vancouver, Edmonton, Calgary and intervening points, where he saw all important bond dealers and mayors and municipal treasurers.

All this is in addition to special visits to different parts of Canada for information that will help the readers of the various publications in their own line of work.

It will thus be seen that the MacLean publications do not depend on theoretical charts and cycles prepared at his desk by an Editor who never goes out. These things are useful in conjunction with history and experience, but current facts are given first place.

New Goods of Interest to the Plumbing Trade

A BUCKET TRAP

The Dunham type No. 80 bucket trap for high pressure service which the C. A. Dunham Co. Ltd., Davenport Road, Toronto, have recently placed on the market, attracted considerable attention at the C. A. S. E. convention at Toronto. This company specializes in the manufacture of heating and power plant specialties and produces a line of steam traps to meet a wide range of uses.

The manufacturers claim that a new and distinctive feature is incorporated in this new bucket trap—namely a quick, snappy, closing action.

It is quite fully appreciated that bucket traps generally are slow or draggy in their closing action, and this condition causes more or less wire-drawing and cutting of valves and seats, with incidental maintenance expense, and loss of steam.

The Dunham bucket trap operates on the same principle as other bucket traps, but the destructive effect of steam wire drawing the seat is reduced to a minimum, by the quick closing accomplished through the shape of the Dunham bucket. The proportion and shape of the bucket is such are when it begins to rise, all water inside the bucket is shifted towards the hinge, filling the water seal and the movement of the bucket up-

wards is accelerated, which produces a quick, positive, forceful action and reduces the wear on the valve and seat.

The C. A. Dunham Co. Ltd., Davenport Road, Toronto, have recently issued a new bulletin on this line, completely describing the product. Every steam plant engineer can procure a copy of it by writing the manufacturers.

NEW DURO WATER FILTER

A new water purifying filter has been placed on the market by the Duro Pump and Mfg. Co. Some of the advantages and claims made by the manufacturers are as follows:

It is a physical means of filtering and purifying any water passing through its chambers. The water passes through the inlet screen; and then through the Carbo-Ash and then through the final purifier and into the discharge line. Its capacity is 360 gallons per hour. It does not affect the operation of the pump and causes no noticeable back pressure. It cleanses and carifies and exercises a purifying effect. It removes discoloration in cistern, well, lake or spring water. It removes dirt, solids, small particles and sediment impurities. It provides clean, clear sparkling water for every purpose. It works without attention—no moving parts or mechanism.

The filter is generally connected to the discharge line preferably between the pressure tank and house fixtures. Unions are provided for easy connection. The Carbo-Ash lasts indefinitely. It may be cleared once annually by removing and washing and then replacing.

Buy, build, work, and create a job for every man, prosperity for all.—Rotary Club Poster.

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

SEASONABLE quantities of plumbing and heating goods have been sold during the past two weeks. Heating contracts at the present time seem to be more prevalent than other work also coming under the heading of plumbing, heating, and sanitary engineering.

Galvanized sheets have been selling in good volume of late, possibly as a result of a few dealers having shaded prices in this line to a small degree. Soil pipe and fittings also have been selling very well; many rural syphon sewage systems now being

installed are the means of stimulating those sales to a great extent.

A scarcity in I.C.L. 20 x 28 tinplates exists in some parts of Ontario.

Trimo and some lines of Stillson wrenches have undergone advances in price, as also have Dominion wipers. In Montreal a slight decline has occurred in solder.

Collections are only fair. Many dealers expect an improvement in this respect early in the fall, at which time business is also expected to have shown a noticeable improvement.

Montreal Markets

MONTREAL, July 28.—Trading in enamelled ware and closet goods is reported as light with prices showing no change from that of the last issue. Eavestrough and conductor pipe remain firm with dealers reporting quite active sales. Corrugated sheets show no change in price and dealers generally anticipate a revival of trade in this line now that the farmer is in between seasons and will turn his attention to his buildings.

In the ingot metal market an improved tone is noted this week, and while the advances are not rapid they indicate an improved sentiment which might carry prices higher.

Collections are reported as fair and business generally is represented as being quite seasonal.

TRADING IN ENAMELLED WARE STILL REPORTED LIGHT

Montreal.

Trading in enamelled ware is still reported light by dealers locally. No changes in price are noticed with local quotations as follows:—

Sinks, flat rim—	1 only	2 only	3 only
16 x 24	\$ 7 50	\$ 7 40	\$ 7 30
18 x 30	8 70	8 60	8 50
20 x 30	9 90	9 80	9 70
Bath tubs, roll rim, 4, 4½, 5 feet, 24 to 30 in. wide			51 40
Bath tubs, 5½ feet,			57 10
Lavatories—			
17x19 in. Apron F139 or P4045.....			15 30
18x24 in. Apron F154 or P3845 or P3847			23 60
18x21 in. Apron F169 or P4205.....			17 60
17x19 in. Roll rim. F241 or P4345.....			12 60
Less 30 per cent.			

SOIL PIPE AND FITTINGS REMAIN FIRM

Montreal.

No change is noticed in discounts on soil pipe and fittings. Dealers report sales quite seasonal in these lines. Local discounts as follows:—

SOIL PIPE—	
2 and 3 inch.....	20%
4 inch	25%
5 and 6 inch	20%
8 inch	net
FITTINGS—	
2 to 6 inch	37½%
8 inch	net

LEAD AND ZINC GOODS MOVING WELL

Montreal.

Good sales are reported in solder and lead. Prices now in effect quoted locally as follows:—

LEAD AND ZINC PRODUCTS—

Lead pipe, per 100 lbs., up to 2 in.	14 50
Do., 2 in. to 8 in.	15 50
Do., 8 in. and over	16 50
Lead waste, per 100 lbs.	15 50
Lead wool, lb.	0 13
Lead sheets, 2½ lbs., sq. ft. lb.	0 10½
Lead sheets, 3 to 3½ lbs., sq. ft. lb.	0 10
Do., 4 to 8 lbs., sq. ft. lb.	0 09½
Cut sheets, ¾ lb. extra and cut sheets to size 1 c. lb. extra	
Solder, wiping, lb.	0 24½
Solder, commercial, lb.	0 25
Solder, strictly, lb.	0 27
Solder, guaranteed lb.	0 29
Solder wire, lb.	0 39
Solder, commercial, lb.	0 25
Solder, strictly, lb.	0 27
Solder guaranteed, lb.	0 29
Solder wire, lb.	0 39
Zinc sheets, casks	0 11
Do., broken lots	0 12

NO CHANGE IN PRICE ON CORRUGATED SHEETS

Montreal.

Dealers in corrugated sheets report seasonal sales and are looking for an increased demand due to the fact that the average farmer is now between sea-

sons and will turn his attention to the roofing of buildings.

CORRUGATED SHEETS—	Per 100 sq. ft.
No. 28 gauge	7 00
No. 26 gauge	7 50
No. 24 gauge	10 00
No. 22 gauge	12 50
No. 20 gauge	14 00
No. 18 gauge	19 00

Less 10 per cent.

Lighter than 24 gauge and wider than 27 ins., 75 cents per square extra.

COPPER AND BRASS PRODUCTS ARE FIRM

Montreal.

No change in price is noticed in copper and brass products. The market is steady with quotations as follows:—

BRASS—

Sheets, base	0 27
Rods, ½ to 2 inches, round.....	0 24
Tubing, seamless, base	0 32

COPPER—

Rods, ½ to 2 inch.....	0 30
Soft sheets, plain, 16 oz. and heavier, lb.	0 33
Plain tinned, 16 oz. and heavier, lb.	0 40
Polished, and tinned, 16 oz. and heavier, lb.	0 44
Tubing, lb.	0 34
Above prices are for full sheets or bars. Cuts 5c. per lb. higher.	

EAVESTROUGH AND CONDUCTOR PIPE IN STEADY MARKET

Montreal.

Dealers in eavestrough and conductor pipe report seasonal sales. Prices remain unchanged at levels established some time ago.

EAVESTROUGH—

O. G. round and half round, per 100 ft. 3 in., \$16.90; 10 in., \$18.70; 12 in., \$22.20; 15 in., \$35.50; 18 in., \$45.00.

O. G. Square bead, per 100 ft.; 8 in., \$15.90; 10 in., \$17.70; 12 in., \$21.20; 15 in., \$34.50; 18 in., \$44.00.

Discount 65 and 5 per cent.

CONDUCTOR PIPE—Round, Plain and Corrugated, per 100 ft.; 2 in., \$18.40; 3 in., \$22.30; 4 in., \$29.60; 6 in., \$48.00; 8 in., \$58.80.

CONDUCTOR ELBOWS—

Plain or corrugated, price per doz. 2 in., \$5.25; 3 in., \$6.00; 4 in., \$10.50; 5 in., \$24.00; 6 in.,

NO CHANGE IN PRICES ON CLOSET GOODS

Montreal.

Since the minor price adjustments in the last issue there have been no changes in price on closet goods in the local market. Trading still remains somewhat quiet with local quotations as follows:

CLOSET COMBINATIONS—

Low Down Outfits, each	
Closet, standard outfit, oak.....	24 00
Do., post hinge seat	24 50
Do., oak vitro or Pussyfoot	24 00
Do., post hinge seat	25 50
Do., mahogany vitro or Pussyfoot, post hinge seat and cover	28 00
Do., vitreous china, oak post hinge seat and cover	29 00
Do., vitreous china, mahogany post hinge seat and cover	30 00
Do., white vitro or Pussyfoot, mahogany post hinge seat and cover	30 00
Do., enamelled iron tank, oak post hinge seat and cover	29 50
Do., enamelled iron tank, mahogany post hinge seat and cover	29 50
Add for 3/4" valve on supply pipe	1 25
Add for spud	0 60
Add for reverse trap bowl	1 50
Add for syphon jet bowl	7 00
Deduct for supply pipe	0 80
Deduct for floor hinge	0 60
Richelieu bowl	8 00
Washdown bowl with spud	9 50

Syphon jet bowl with spud	15 00

CLOSET SEATS—

Oak post hinge seat and cover	3 85
Oak wood strip seat and cover	3 50
Mahogany finish post hinge seat and cover	4 05

CLOSET TANKS—

Low down, oak vitro or Pussyfoot with fittings less seat	12 00
White vitro or Pussyfoot with fittings, flush elbow and supply	16 50
Vitreous china tank with fittings, flush elbow and supply	16 00
Enamelled iron with fittings, flush elbow and supply	16 00

SEASONABLE BUSINESS REPORTED IN METAL LATH

Montreal.

Dealers in metal lath report good seasonable business. Prices remain unchanged and are quoted locally as follows:—

METAL LATH—	per sq. yd.
Painted—	
26 gauge	23c.
24 gauge	28c.
32 gauge	32c.
Galvanized, 5c. per sq. yd. extra.	

QUIET TONE PREVAILING IN RADIATORS AND BOILERS

Montreal.

In the radiator goods market a quiet tone prevails this week but dealers generally are looking for a revival of trade very shortly. Prices now in effect are the same as have ruled for some time past.

RADIATORS AND BOILERS—

Radiator list prices are for 1, 2, 3, 4 and 5 column radiators, per sq. ft.
 45 in. to 38 in., \$1.32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60. Discount 44 per cent for hot water, and 45 per cent. for steam.
 Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05; Discount 41 per cent.

Boilers—Round t water boilers, sizes from 0 to 10, 52 per cent. off list. Square or sectional hot water or steam boilers, 15 in., 3 per cent. with Ontario Government trimmings, list/Square or sectional water boilers, 19 in. to 36 in., 8 per cent. Square or sectional steam boilers, 19 in. to 26 in., 6 per cent. Ontario Government trimmings, list plus 7 per cent. Square or sectional water or steam boilers, 48 in., list plus 10 per cent. With Ontario Government trimmings, list plus 13 per cent.

Round steam boilers, standard trimmings, 16 per cent. Ontario Government trimmings, 13 per cent.

F.o.b. Montreal, Toronto, Guelph.

STEADY SALE CONTINUES IN PIPE FITTINGS

Montreal.

Dealers in pipe fittings report steady sales in this line. Prices show no change, remaining at levels established some time ago.

PIPE FITTINGS—

Cast iron fittings	10%
Plugs, cast iron	10%
Do., solid	10%
Do., countersunk	10+
Bushings, cast	15%
Do., malleable	15+
Unions	30%
Flanged unions	10%
Flanged fittings	27 1/2%
Dart unions, black, 1/4 to 2 in.	331-3%
Do., 1/4 in., 2 1/2 in., and larger	23%
Do., galv. add to black	30%
Nipples, 1/4 to 4", close and short	50%
Do., long	55%
Do., 4 1/2 to 8", close and short	40%
Do., long	45%
Couplings, 4" and under	25%
Do., 4 1/2" and larger	5%

Malleable Fittings—

Piece list effective June 1st, 1922. Discount 63 per cent.

IRON AND STEEL MARKET SHOWS NO CHANGE

Montreal.

No change is reported in iron and steel with the market taking on a somewhat quiet tone. Local quotations as follows:—

IRON AND STEEL—

Common bar iron, 100 lbs.	3 95
Refined iron	5 45
Irish finish machinery steel	4 00
Mild steel	3 95
Single reeled machinery steel	5 50
Band steel	3 95
Sleighshoe steel	3 95
Tire steel	4 15
Harrow tooth steel	3 80
Toe caulk steel	4 85
Mining tool steel, per lb.	0 19
Black Diamond tool and cast steel, per lb.	0 19

NOTE.—Refined iron is approximately \$1.50 per cwt. over base, but fluctuates owing to unsettled market.

Band steel in scroll bundles, 50c per 100 lbs.

Iron and steel 3-16 in. and thinner, 50c per 100 lbs. extra.

NO CHANGE NOTED IN PRICE OF WROUGHT IRON PIPE

Montreal.

No change is noticed in the price of lapweld and butt weld pipes. Prices still based on list No. 59 issued some time ago.

WROUGHT PIPE

Price List No. 59. April 24th, 1923.

IMPROVED TONE NOTED IN INGOT METAL MARKETS

Montreal.

The metal markets have taken on an improved tone this week and while the advances are not rapid they indicate an improved sentiment which might carry prices higher if conditions develop satisfactorily in Europe.

TIN.—This metal was quite strong in London the early part of the week and while it has since re-acted slightly it is more cheerful. Should the July statistics be favorable a moderate advance might ensue. The local market is firm at 46 cents per pound.

COPPER.—Both London and New York are firm without any appreciable advance in price. The situation remains steady and prices are more likely to advance than to recede. Local market is

steady at 20 cents for electro and 19½ cents for castings.

LEAD.—The American market has firmed up again and an advance of 25 cents by the Trust shows the present trend. The European situation is firm and evidently there is no surplus in that quarter at present. The local market is firm at 8 cents per pound.

SPELTER.—London has been advancing steadily and the American market is also firm in tone. With ore at present prices there is little or no profit at present prices to producers and a seasonal advance would seem to be justified. The local market is strong at 9¼ cents to 9½ cents per pound.

ANTIMONY.—Offerings from China are on a higher basis and some business has been done for import. Local market remains steady with prices unchanged from last week.

Toronto Markets

TORONTO, July 28—There is quite a noticeable improvement in the sales of soil pipe and fittings of late. Local foundries are working to full capacity and they report many new orders. Rural districts are installing many more sanitary outfits, as a large portion of new business being received by local foundries and makers of soil pipe, etc., is in the form of orders for sanitary syphon equipment,

Galvanized sheets are quoted in some quarters at lower prices though the majority of distributors are still holding to former levels, and claim that a reduction is not warranted at the present time.

Ingot metals show very little change this week. Copper shows up a little stronger, being quoted at \$18.00 to \$19.00 and Antimony remains at the same price as last week but a slightly weaker note is manifest.

Collections are not expected to be much better until the trade has felt the effect of some of the good business, which is expected early in the fall, and which some dealers claim has already begun to arrive.

SOIL PIPE FOUNDRIES WORKING FULL TIME

Toronto.

Business in soil pipe has been very good lately. Local foundries are working at full capacity. An increase is quite noticeable in rural sanitation requirements, as many orders for syphon equipment are being received. No changes have occurred. The tendency is that prices in this line will remain firm for some time.

INGOT COPPER STIFFENS DURING THE PAST WEEK

Toronto.

Ingot copper which has been strengthening for some time, is still very firm at \$18.00 to \$19.00. Though antimony has not changed in price, market conditions with this metal are inclined to

be slightly weaker. Prices in force at present are given herewith:—

INGOT METALS—

Copper \$18.00 to \$19.00; Tin \$45.00 to \$46.00; Lead \$8.00 to \$8.25; Spelter \$9.00; Antimony, \$8 25 to \$8.50; Aluminum, \$23.00 to 25.00.

PIG IRON MARKET SLIGHTLY WEAKER

Toronto.

There is a slight contraction still in evidence in the production of pig iron. Several furnaces in the U. S. have been put out this week. Many of the mills still have some back orders to fill, but they are catching up slowly, and reduced buying is in evidence, which is tapering off orders on mill books. Steel deliveries in all sections are becoming easier.

PIG IRON—(Price per ton)—

In ordinary quantities 34 05

SCRAP MATERIALS MARKET AGAIN QUIET

Toronto.

Towards the end of the last week the scrap materials market took on a brightened aspect, the first wave of an encouraging nature to be felt for some

time in that market. This week, however, again sees the market in a dull condition, no more business being done daily than was experienced three weeks ago, which was about the quietest period experienced. No changes have been made in prices for some weeks past.

ASBESTOS PRODUCTS EXPERIENCE SOME BRISK TRADE

Toronto

Business in asbestos pipe covering, millboard, paper and boiler covering experienced a wave of brisk business during the past two weeks. This is a decided change from the quietude of the asbestos market which has been prevailing for some time past, and has created quite a lot of optimism among dealers in these lines.

Quantities of goods which had been lying in dealers' warehouses for some weeks past have been sold or contracted for, and it is believed by some distributors that business has taken a turn for the better that is going to be lasting.

ASBESTOS PRODUCTS—

Pipe Covering—	
Air cell, 4 ply	50 per cent. off list.
Air cell, 3 ply	55 per cent. off list.
Air cell, 2 ply	57½ per cent. off list.
Boiler Covering	\$1.50 — \$2.00 per bag.
Asbestos paper or felt	\$8.25 \$9.00
Magnesia pipe covering	less 40 per cent.
Magnesia pipe covering, small lots, less	35 per cent.

PIPE WRENCHES ADVANCE TEN PER CENT.

Toronto

A ten per cent. advance has taken place in the price of Trimo pipe wrenches and parts for Trimo wrenches. The new price established and which is ruling now is 45 per cent. off list prices.

PRICES ON DOMINION WIPERS MOVE UPWARDS

Toronto

White Dominion wipers are now selling at 19 per pound and the colored wipers are priced at 15 cents per pound. These prices are advanced about ten per cent. over the old prices on these goods.

RADIATORS AND BOILERS ARE ENJOYING GOOD SALES

Toronto

The continuance of a good amount of building has kept up a steady and good trade in boilers and radiators.

RADIATORS AND BOILERS—

Revised radiator list prices are for 1, 2, 3, 4 and 5-column radiators per square foot.

38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60.

Discount on 2, 3, 4 and 5 column standard sizes, 44 per cent. for water and 45 per cent. for steam.

Discount on 1-column standard size, and 2, 3, and 4-column hospital sizes 36 per cent. for water and 37 per cent. for steam.

Discounts on 1 column hospital size water 22 per cent. Steam 23 per cent.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05. Discount 41 per cent.

BOILERS—

Water: Round 52 per cent. off list. Square 8 per cent. off list.

Steam: Round, 13 per cent. off list; Square, list plus 7 per cent.

GALVANIZED SHEETS SELLING READILY

Toronto

A slightly easier note has been felt this week with regard to galvanized sheet prices. While most distributors are maintaining the prices issued formerly, some dealers are breaking towards lower levels.

SHEETS, GALVANIZED, BLACK AND BLUE—

NO PRICE CHANGES IN MANY LINES

Toronto.

Range boilers this week were not affected by any price changes, nor were cotton wastes, boiler tubes, corrugated sheets, boiler stands and lavatory fittings and brass goods.

I.C.L. TINPLATES SCARCE IN SOME SIZES

Toronto.

Tinplates, I.C.L., 20 in. by 28 in., are very scarce locally. Unless there is an arrival of some of this size, the price will likely advance in the near future.

Winnipeg, Man.

WINNIPEG, July 28.—An improvement has been noticed in the demand for all lines of plumbers' and steamfitters' supplies. Prices remain as before on corrugated sheets and eavestrough and dealers report a satisfactory trade. Solder has shown a slight decline. A better tone prevails in the West and crops are coming along nicely and later in the Fall business is expected to show a decided improvement.

NO CHANGE IN PRICES ON WROUGHT IRON PIPE

Winnipeg.

Local dealers report a seasonable demand for wrought iron pipe, and no price change is recorded.

EAVE AND CONDUCTOR PIPE SELLING WELL

Winnipeg.

There is an increased demand for eave and conductor pipe, and as the season advances an improvement is expected. Local quotations remain unchanged.

FAIR VOLUME OF SALES IN SHEETS AND PLATES

Winnipeg.

There is a fair demand for galvanized black and Canada sheets as building activities increase. An improvement on this line is looked forward to.

LEAD AND ZINC GOODS MOVING WELL

Winnipeg.

Good sales are reported by dealers on lead and zinc goods and prices locally are unchanged.

BOILER TUBES QUIET

Winnipeg.

A quiet tone prevails on the market for boiler tubes. Prices show no change.

FAIR DEMAND FOR SOIL PIPE AND FITTINGS

Winnipeg.

There is a seasonable demand for cast iron soil pipe and fittings. Iron soil pipe fittings, size 2 to 6 in., are quoted at 30 per cent. and 8 inch at 15 per cent.

advance. Iron soil pipe, 2 and 3 inch, is 5 per cent.; 4 inch, 12½ per cent., while 5 and 6 inch is quoted at 5 per cent., and 8 inch at 15 per cent. advance.

IRON AND STEEL PRODUCTS ARE WITHOUT CHANGE

Winnipeg.

Bar products still remain in a firm market with prices showing no change locally.

COTTON WASTE SELLING FAIRLY WELL

Winnipeg.

Fairly good sales have been recorded locally on cotton waste and oakum.

A DECLINE IN SOLDER NOTED

Winnipeg.

Wire solder shows a slight reduction and is quoted at 41c. per lb., with tinkers at 31c. and wiping at 30c. in case lots, and 31c. in less quantities. Resin core is quoted at 70c. per lb., and acid core at 75c.

FLUE BRUSHES MOVE DOWNWARD

Winnipeg.

A slight reduction is in effect on spiral flue brushes and the following sizes are as listed below:

SPIRAL FLUE BRUSHES—

Each—Size 1½ in. 30c; 2 in. 40c; 2½ in. 50c; 3 in. 60c; 3½ in. 70c.

RANGE BOILERS SELLING IN GOOD QUANTITY

Winnipeg.

There is a good demand for range boilers created by building activities. All sizes are moving fairly well.

THE crop conditions have never been as bright. There is maturing throughout the entire western prairies the finest crop of grain that we have ever seen, even exceeding that of 1915, and it has been estimated by various authorities that the yield this year will be 500,000,000 bushels. Nothing but a calamity can prevent an exceptional harvest and all districts seem to have the same report. There is not a single section where the crops are not promising. Some areas have been visited by hail storms, and it is to be regretted that the losses in certain spots are severe, but the hail damage covers only a very small fraction of the country's acreage. A great deal of anxiety now prevails as to the possibility of black rust affecting the yield, but as far as I can learn to this date, no authentic reports have been received to warrant this anxiety. The weather has been much better during the last week or two, and if we get the continued hot days with cold nights and no rain, there should be very little trouble from rust. It is specially gratifying to know that some of the districts that have suffered most severely from drought during the last six or seven years are this year apparently going to harvest the finest crops of any.

Price Decline Serious

The decline in price of grain is a serious matter and it is to be hoped that the efforts of the various farmers' organizations to inaugurate a wheat pool will be of benefit, although many doubt whether it will be of much help. It must be expected, however, that with the tremendous crop in sight, with a large quantity available for export, the price cannot be a high one. It must be remembered that with last year's crop most of the farmers were able to liquidate a considerable portion of their indebtedness, and we have every reason to believe that with a good crop this year, the situation will be further improved and business will undoubtedly be greatly stimulated.

The spread between what the farmer has to pay for his supplies and the price he gets for his grain is altogether too great, but it is a pleasure to note from the statements of various farmers, that even under present conditions farming in this country is a paying proposition regardless of the reports to the contrary that have been spread broadcast throughout the country during the past couple of years.

Less Credit

Collections during the early summer months have been as good as one could expect, and in fact have been somewhat better than the previous year. The farmers are asking and the dealers are giving less credit, which makes a much healthier condition, and strenuous efforts will undoubtedly be made by all the dealers to collect their outstanding accounts as early as possible after the crops are threshed.

Dunham Radiator Traps Insure Service¹ that is Noiseless—Sure—Lasting

No. 1

No. 2

No. 3

No. 4

No. 5

The Dunham Two-Part Radiator Trap

Made in five sizes as shown. The Nos. 1, 2 and 3 Traps are regularly furnished nickel-plated and with union nut and nipple, threaded right hand. They may be supplied in angle, straightway, right hand, or left hand pattern. The body and cover are made of red brass.

The Nos. 4 and 5 Traps are painted battleship gray and furnished in either angle or straightway patterns with female right hand threaded connections, both inlet and outlet. The body and cover are made of the best gray cast iron.

Maximum operating pressure ten (10) pounds gauge.

Dunham Radiator Traps were the first thermostatic disc traps. After 20 years of unparalleled service they are still the last word in radiator trap efficiency. To the heating contractor who has experienced the annoyances of other types we recommend the Dunham Trap as a certain means to personal satisfaction and better pleased customers.

The Dunham Radiator Trap automatically releases all air and condensate and retains the steam within the radiator. Its construction is simplicity itself. Write for detailed technical information to-day.

The DUNHAM
HEATING SERVICE
(Made in Canada)

Seven Points of "REX" Union Superiority

- 1 "Rex" Unions are tested and guaranteed to stand 250 lbs. working pressure.
- 2 The counterbored ends prevent the first thread becoming battered and permits an easy entrance of the pipe.
- 3 They will not corrode and will withstand vibration, expansion, contraction, fluctuating pressures and other severe conditions.
- 4 The bronze to iron seat, as used in "Rex" Unions, is recognized as the best known combination of metals to be used for permanent joints and where frequent disconnecting is necessary.
- 5 The octagonal shape of the three parts permits of connections being made with an ordinary monkey wrench.
- 6 The uniform diameter of the waterway insures an unobstructed flow and thorough drainage.
- 7 "Rex" Unions can be supplied threaded to either Briggs or Whitworth Standard and can therefore be used for your export trade.

A Proof of "Rex" Union Superiority
Canadian Car & Foundry Company, Limited
Montreal, Que.

FITTINGS, LIMITED, Oshawa, Ont.

Dear Sirs:—Confirming our conversation with regard to Rex Unions; as you are aware, we have recently purchased from your Company a large quantity of Rex Unions, and have found them satisfactory in every respect. They appear to have more metal in them than other Unions, and we also find them interchangeable; in fact we are very well pleased with them and intend specifying your Unions on our orders where we can consistently do so.

Yours very truly,

CANADIAN CAR & FOUNDRY COMPANY, LIMITED,

FITTINGS LIMITED
Oshawa, Canada

Canadian Exhibition Train Now in France

Formal Opening Took Place at Le Havre—Sanitary Engineer Finds Place in Exhibit—French Government Constructed Thirty Special Motor Trucks—Two Months Will be Spent in Paris

ARRANGEMENTS with regard to the various exhibits of Canadian manufacturers and producers, which will compose the Canadian Exhibition Train for France, are now completed and the formal opening took place on July 15 at Le Havre.

The French exhibition train in Canada was of the usual railroad type, but owing to the unsuitability of French railway trains and stations the French government have had constructed forty large motor trucks, thirty of which will contain exhibition cases approximately 19 ft. 6 in. by 6 ft. 6 in. by 6 ft. 6 in. These cases will be decorated as first-class modern show windows, and the manufactured products and produce of Canadian farms, mines, fisheries, forests, and factories will be attractively arranged within. Ten motor trucks will accompany the convoy to carry all necessary equipment in the matter of lighting, extra supplies, printed matter and baggage.

At each point in the itinerary the thirty exhibition trucks will be drawn up in a double line from twenty to thirty feet apart. The inner sides of the motor trucks will open outwards. The upper leaf will be raised to extend outward as a partial shelter; the lower leaf will be lowered to cover the wheels. The upper leaves will be joined by a vellum covering so that a covered passage-way will protect visitors from inclement weather.

Canadian manufacturers and producers who are represented on the train will benefit both by orders which they may book, and by the opportunity afforded them of establishing agencies or appointing representatives throughout France. A further point which may be of even greater advantage to them is the fact that they will be brought into close contact with buyers and will be able to gather information as to their real requirements as regards quality and style of manufactured goods which will enable them to sell successfully in French markets. No samples or goods of any kind are, however, to be supplied from the train, the entire furnishings of which have been admitted into France through courtesy without a tariff charge.

In co-operation with the French Committee the Government have made arrangements to supply representatives with a list of possible clients at every point visited. Provision has been made by the French Government for the transport and lodging while travelling of 40 persons with the convoy.

The Canadian Government are preparing an attractively designed poster, and have made arrangements to have it placarded in the chief towns and cities

The MACLEAN PUBLISHING CO. Limited Fondée en 1886

of France during the tour of the Exhibition train.

At the completion of the tour the motor convoy will proceed to Paris and will be set up close to the Orangerie near the Place de la Concorde. New features will be installed from time to time to keep up the public interest. The exhibition in Paris will continue for two months.

The MacLean Publishing Company's exhibit of which an illustration is given on this page will take up one end of one of the motor trucks. The exhibit is

made to imitate a store window and will display copies of the various MacLean Company's publications. Accompanying the exhibit there will be an attendant who will have a bound file of the latest copies. Specially printed cards in French will also be distributed to inquiring individuals. The attendant has also been supplied with a bound and indexed folder which enables him to give full information in regard to every MacLean publication.

A complete list of exhibitors will be published in a future issue.

What do you want to know about WATER HEATERS?

Send for the new complete catalog
of the complete Pittsburg Line

THIS new book is more than a catalog displaying and describing the eighteen different sizes and types of water heaters that make up the Pittsburg line. It is a complete reference book on water heating. It not only gives in detail the construction of Pittsburg Heaters, but contains also full details of the methods of installations, the operating costs, the flue and gas conditions necessary for the operation of tank, storage, automatic and supplementary hot water systems for every purpose.

Send the coupon to-day for this new book. When we send it we will tell you about the "Selling the Consumer" plan—a special, localized sales-promotion campaign—directed to the most probable buyers of water heaters in *your vicinity*—a plan that has had remarkably successful results in localities the country over.

Steam and Hot Water Radiator Valves

Improved Types

Fig. 490.
Steam Radiator
Valve; Angle
Screwed.

Fig. 493.
Hot Water Rad-
iator Valve.
Screwed.

Designed, like all Jenkins Valves, to render satisfactory service, assuring economical and efficient operation of the radiator.

Made in either screwed Ends or Male Union and fitted with the new Fibre Composition Wheel.

The Hot Water Radiator Valves open with a quarter turn of wheel. Full opening equals the nominal diameter of the Pipe. A small hole drilled in the plug permits a slight circulation of water through the radiator at all times.

Steam Radiator Valves are equipped with a Genuine Jenkins Composition Disc, easily and inexpensively renewed and, like all genuine Jenkins Valves, can be repacked under full pressure when wide open.

You can instal these Jenkins Models with the assurance that they will furnish a maximum of satisfactory service.

USE

TESTED Soil Pipe

IT COSTS NO MORE AND YOU KNOW THE JOB IS RIGHT

Manufactured by

FORWELL FOUNDRY, LTD.

KITCHENER, ONT.

A Suggestion

"Medium Weight soil pipe has a round bead pattern at the hub to distinguish it readily from the Extra Heavy weight pipe which has a flat bead pattern.

This is only a matter of design, one being as strong as the other.

We respectfully suggest the advisability of continuing the excellent practice of invariably specifying medium weight pipe in the round bead pattern."

Are These The Opportunities You're Looking For?

Fan Heating and Ventilating Engineering is the pinnacle of all other forms of heating, and of all branches of steam fitting and sheet metal work. It prepares you for:

1. For Employers it enlarges their business opportunities 100%.
2. Employees it raises to Foremanship of a large shop.
3. Or as Designing Engineer of some large Heating Contractor.
4. As an intelligent Salesman of Heating Appliances.
5. As Chief Engineer with a Heating or Furnace Manufacturing Co.
6. Later a Consulting Engineer to Architects and Building Contractors, etc.

Which of These Are You Working for?

Full Information Free.

DESOLVO makes Regular Monthly Customers

A specialty you'll sell more regularly than many staple items. Thousands of Desolvo dealers say, "The first 50 cent can is always followed every month by another, because it

keeps their customer's drain pipes cleared of obstruction and unsanitary odors."

You can sell a can of Desolvo to every customer, every month. It moves steadily once a customer knows what it will do.

A small investment which nets you a good profit. Sold through jobbers.

K-K—A companion to Desolvo, cleans closet bowls, removes stains and odors.

The Chamberlain-Desolvo Co., Ltd.
Toronto . Canada

These machines are used in many of the largest industrial plants returning condensation from Heating and Steam process work under various conditions.

It will pay Heating Contractors to give more attention to the utility of our return traps.

They save coal, raise efficiency and for this reason are steadily superceding Boiler Feed and Vacuum Pumps.

Send us your next prospect, also send us your trouble jobs of heating or other steam work.

See us in Machinery Hall, Canadian National Exhibition, Aug. 25 to Sept. 8.

The Donnelly Pressure Relief Valve for closed plumbing and hot water heating systems makes homes safe.

Life—Property Insurance at a Low Rate

A Donnelly Pressure Relief Valve offers absolutely reliable protection against explosions due to excess pressure in closed plumbing and hot water heating systems at a cost that is negligible in proportion to its value.

It has no weights—no interior springs—it will not stick or corrode and functions like clock work. Any mechanic, in a moment's time can set it for any pressure from a fraction of a pound up.

It is fully guaranteed.

Tuned Up by Experts

THAT we place the utmost importance upon the proper functioning of Vitro Tanks is shown by the fact that they are always sold complete with fittings.

These fittings—Vitro Fittings all of them—are installed by us at the factory and tested carefully **before** the tank goes on the market.

This means that Vitro Tanks, in addition to being equipped with fittings that are built especially for them, are tuned up by experts who can detect and remedy any tank defect that may show signs of developing.

This mechanical perfection plus the sheer white gloss beauty of Vitro Tanks accounts in a measure for their great popularity. They again lead in sales, for the first six months of 1923, every other tank in the market.

No. 20 "Quietus" Plain.

No. 20-S-X "Quietus" side supply extended front lip.

No. 20-V "Quietus" Raised Rear Vent.

There is No Closet Better Than the QUIETUS

The manufacture of Canadian Solid Vitreous syphon jet closets is a science which has been perfected by years of exacting experience, and from the many and varied types which have been evolved the "Quietus" has been developed, unquestionably supreme.

To perfect the action of each different closet we manufacture is our first consideration and neither time nor expense has been spared to realize this end, with the result that the action of all closets we manufacture stands out strong, decisive and superior.

The "Quietus" would be a notable example of superior action were that its only feature, but in addition is introduced the element of QUIETNESS so that refinement has been added to substantial enduring utility. The "Quietus" is as nearly silent as a closet can be made.

This is accomplished by special construction of the water supply, so that instead of permitting the water to rush in with the usual noise, its flow is retarded so that it glides into the bowl so quietly that the action of the closet cannot be heard outside the toilet-room itself.

Made of Solid Vitreous ware, through and through, the "Quietus" ensures a life-time of unchanging service, its impervious white lustrous surface being as easily kept clean as a china plate. Its quietness of operation is its final recommendation to people of refinement who appreciate the removal of embarrassing noise from the toilet.

In addition to the plain design closet, we can furnish the "Quietus" with extended front lip, side supply and raised rear vent as shown in the illustrations, to suit architectural requirements calling for these special features.

**Our sales are handled exclusively through the
recognized jobbers in plumbing supplies.**

The Delco-Light line of electric pumps means more sales, easier sales! —more dollars in your pocket!

WHEN you handle Delco-Light Electric Pumps you have available 26 different styles and sizes. You have a size to fill the needs of any prospect. You handle a line of pumps made by Delco-Light, and backed by the Delco-Light organization. Pumps for deep or shallow wells; for A.C. or D.C. service; for any capacity; for deep wells you have either the $\frac{1}{4}$ H.P. or $\frac{1}{2}$ H.P. pump of the pitless, weather-proof type—superior to any deep well pump ever put on the market. All simple in design. No exposed moving parts. Only one place to oil. Easily installed. Extremely low in price and at the same time they have the superior quality which has made Delco-Light deservedly famous.

This is the best line of electric pumps ever offered. It means more sales, easier sales—more dollars in your pocket! The Delco-Light Distributors have a proposition waiting for plumbers and pump dealers. Write today and find out about it. Send a postcard to your nearest distributor.

DELCO-LIGHT

Water Systems

For Country and City Homes

Good Business Now Better Business to Come

Rural dwellers need septic tanks and need them badly. In the not far distant future these farmers and suburbanites, instead of waiting to be sold, will ask for sewage disposal systems voluntarily.

Naturally they will seek advice from the Sanitary Engineer in their district who has made a practice of installing equipment of this sort. If you are not pushing the sale of sewage disposal systems you are losing not only immediate business, but also future business of great potential value.

Get in touch with us and let us show you how to boost sales in sewage systems.

Use Only Anthes Syphons, Soil Pipe and Fittings.

New King Selling Points

Boilers with easily understood and convincing selling points that "get over" with the average householder—are the kind of boilers you like to sell.

The New King Hot Water Boiler is that kind of boiler.

Note these points of superiority:—

The two side nipple construction gives positively balanced circulation of water over all Heating surfaces. No other Boiler has the same positive water travel as the New King Boiler.

The "New King" firepot is made entirely independent of the **first** section, resulting in easier erection and less costly replacements in the event of accident.

These are two of the details of construction which ensure the maximum volume of heat delivered to the rooms, with the minimum expenditure of fuel.

IMPERIAL RADIATORS have graceful, pleasing lines; they add beauty to a room. Then too, they give positive, unfailing heat satisfaction throughout their long years of service.

Write to-day for new catalogue and prices.

Here's Wrench Versatility!

The New "Little Giant" PIPE WRENCH

adapts itself to the hundred and one out-of-the-way places where you have found the ordinary wrench cannot swing, or even reach in and take hold.

Because of the "Little Giant" design (only three jarts) the movable jaw can be engaged with either of two sets of teeth on the small wrenches and of four sets on the larger ones. At least double the wear is the result.

No springs or frame on this wrench—nothing to break. The entire wrench is of drop-forged, heat treated steel, with an extra long handle—more power with the strength to back it up, though actually lighter in weight and easier to handle.

Let us tell you what other engineers say who have used them. Descriptive circular on request.

**Gets into
holes and corners**

Your supply house carries the "Little Giant" or can get it for you. Insist on having it.

"MADE IN CANADA"

Advertising to Build Up Business

A valuable service is being rendered plumbers and builders by the strong advertising campaign for **"Standard"** Plumbing Fixtures now running in Canada's newspapers and magazines.

The cut here used is a sample of this advertising.

Your Town's the Town

In the suburban districts of Your Town—in the farm homes that encircle Your Town—there must you seek and GET the profitable business of selling and installing the Florence Oil Water Heater. That plumbing business generally is good helps not at all unless it is good in Your Town.

Florence Oil Water Heater

The way to make business good in Your Town is to go after it the McClary way.

A line written to-day to our nearest branch will bring you by return mail literature and selling plans, that if fairly followed out, will result in much profitable business.

The Florence Oil Water Heater, here illustrated is a sturdy, compact, inexpensive heater that can be installed anywhere and brings at once city comforts to suburban life. It is simple, safe, efficient and economical. Every farmer and suburbanite in your district is a prospect.

Another Open Letter

Dear Sir,—

I would like to have half an hour with you, and perhaps we can get together if you are in Toronto at Exhibition time.

As of course you know, we make a complete line of Products for Heating and Cooking. And, like every other live concern, we back them up with service and selling helps.

But I believe we could do much more to really help our customers sell, if we knew your particular problems better. I believe we have a group of men who really can help you, and that closer acquaintance will mean more profitable sales for both of us.

So this is my appeal to you to **come in**—either at our Toronto office, or at any branch, and talk it over with the men who are trying to help our dealers. I'd like to make this just as emphatic as I can. Your friends in this organization will be glad to see you; and if we know each other better, we can work together for larger business in a more efficient way.

We go into the fall with splendid stocks, new lines and aggressive selling helps. You and ourselves, perhaps, can team to even better advantage.

Faithfully yours,

A handwritten signature in dark ink, appearing to read "Holt Gurney", with a horizontal line drawn underneath it.

Sell Powder Puffs to Coal Miners

By Jesse H. Neal

HERE is what the Chicago Daily News had to say in one of their own advertisements:

"Perhaps coal miners ought really to powder their noses and look pretty, but we doubt if you would advertise powder puffs in Coal Age, any more than you would picks and shovels in Vanity Fair."

Absurd, ridiculous, impossible, of course; but how about advertisers who, judging by the mediums used, are trying to sell five ton trucks to clergymen, travelling cranes to Vassar undergraduates, leather belting to stock brokers, and concrete mixers to chamber maids.

Advertisers of this type cannot be fishermen, because any fisherman knows that trout are caught with a special rod, bait suited to the season and the locality, skillful handling of the tackle, and that the fishing is done in trout streams, not on the Grand Banks.

The nature of the contact is all important. It is the fundamental principle which underlies the peculiar value of all publications of whatever nature. It is not how many readers are reached, but HOW they are reached. Everything hinges upon the nature of the contact effected.

If this were not true you could send out messenger boys instead of salesmen to speak a piece to each prospect. Why then send out salesmen? Because a salesman is something more than flesh and blood, just as a publication is something more than paper and ink.

What would you think of a salesman who came in to report that he had reached forty prospects in one day? Probably you would remark that you didn't care how many doors he had knocked on, but you would like to know what was the nature of the contact.

I seek the advice of a garage mechanic on my carburetor, but would not look to him for advice on my teeth, nor respect it if volunteered. Likewise, a man's attitude towards a publication depends on his respect for its authority.

If you ask me for a definition I would say: "A publication is a piece of paper and ink plus its editorial value, its character, personality, standing with the readers and general reputation." Its advertising value over and above a piece of printed matter will be proportional to the plus element.

If I were buying space, and I have bought a lot of it, I would ask myself, 1. Is the paper essential to its field? 2. What is the evidence of reader interest? 3. Is the reader interest proven by voluntary paid subscriptions? 4. Are the paid subscriptions audited by the A.B.C.? 5. Is the character of the paper verified by membership in the Associated Business Papers?

No. 2 Toledo Geared Threading Tool. Capacity 2½ in. to 4 in.

More Work and Better Work With

Toledo and Jardine Pipe Threading Tools

This tool threads pipe with less labor than others. It is so simple in construction that it is easier to do work right than to do it wrong. It is compact, light in weight, strong and durable, accurate and speedy. It costs no more than imitations and in one month's production will more than pay for itself.

Ask the man that uses them

See Us at the Toronto Exhibition

At our Booth in the Toronto Exhibition, Aug. 25—Sept. 8, will be exhibited the full Griffith line of Septic Tanks, Chemical Closets, etc. Dayton Pumps, which have impressed the Trade so favorably, will also be shown.

Griffith's all metal Septic Tanks and Dayton Pumps by their fine sturdiness and simple installation have earned tremendous favor with Plumber and Client alike. Together they form the ideal installation job. Much profitable business in Griffith's Tanks and Dayton Pumps awaits the aggressive Plumber this Fall.

Be sure to come and see us; you can be certain of a hearty welcome. We are located on Lansdowne Avenue running north from the centre of Main Grand Stand and opposite the western entrance of Pure Food Building.

Master Plumbers Support Apprenticeship Plan in Port Arthur

Local Building and Plumbing Inspector Conducts Technical Class Each Winter for Instruction of Plumbing Apprentices—Plumbers on Board of Examiners—High Percentages on Practical and Theoretical Work Secured by Some

"T EACH the young idea how to shoot," is a phrase that may be carried into every-day life and occupation. By teaching the young idea how to become plumbers, Arthur Peckett, building and plumbing inspector employed by the city of Port Arthur, is doing a work that will some day bring back to him the satisfaction of knowing that he was in a large measure responsible for to-day's apprentices, who tomorrow will be successful plumbers.

Mr. Peckett gives his services free and each winter conducts a plumbing class in the technical department of the Collegiate Institute. His pupils show a willingness to learn and he has this year been responsible for three young fellows getting their licenses as full-fledged plumbers. Mr. Peckett commenced teaching at the evening classes in 1912. He carried on the work until 1914, when war broke out and the classes were abandoned.

Re-established School

In 1915 he went to the war, and when he returned in 1919 re-established the plumbing school. Each year since, the class has progressed and is growing steadily. The class starts in October and ends in March. This year he had twelve pupils, namely: Hugh MacRae Jr., Nick Pacuzzo, Alex MacRae, Matt Slater, A. Peckett Jr., Fred Shirley, T. Bennett, Louis Anderson, Norman McGregor, Frank Peltier, John Sime Jr., and Peter Giraitt. They range in ages from sixteen to twenty-five years. For faithful attendance and diligence in work, Nick Pacuzzo, Alex MacRae, Matt Slater and Peter Giraitt were presented with certificates by the principal of the Collegiate night classes.

Compact Specimen Job

The photograph shows a miniature job done in a space that is only eight feet to the bottom of the joists, but the full job is completed for the roughing in of W.C., bath, basin and sink, batteries of W.C.'s and basins, and also the necessary venting.

Last year Mr. Peckett was able to

interest the Master Plumbers in the work he is doing. In addition to their co-operation in the classes, the masters each year give a banquet to the members of the class and present prizes for the best work done. This year, Mr. Peckett took up all manner of work, including the roughing in for batteries of basins. He teaches in lead work, jointing and sheet lead work, for he believes every boy should be taught this work so that when he goes out on his own he has ideas in the way of roughing in and is able to do it in iron as well as lead. The work of the plumbing class in Port Arthur has been recognized by such well-known firms as Mueller Mfg. Co.; W. H. Cunningham & Hill, Ltd.; Wolverine, Ltd.; Empire Brass Co., and the Plumbing & Engineer Supply Co., of Fort William.

Examinations For Licenses

Examinations for licenses to act as plumbers were held in the Collegiate, and three candidates, unsuccessful on their first writing, obtained passing marks on their second. They have since been given licenses. The Board of Examiners was composed of J. W. Barnes, chairman, and R. A. Shaw, representing the masters; Matt McArthur and W. Kirkbride, representing the journeymen, and A. J. Peckett, secretary and inspector.

T. Bennett, employed by L. A. Green & Co.; Nick Pacuzzo, employed by the same firm, and Hugh MacRae Jr., employed by his father, passed and were granted licenses. MacRae's percentage was 84 and Pacuzzo and Bennett each secured 80 per cent. All three attended the school for three winter terms. Seventy-five per cent. was required for pass. Two and a half hours were allowed for the examination, and all three finished in two hours. Pacuzzo is an Italian, and this fact is pointed to with pride by Mr. Peckett, who says that the foreign boy has equal advantage with the native-born lad to make good if he will but apply himself. The candidates were examined as to their practical knowledge, theory and chart

ARTHUR PECKETT

Some of the work of the Port Arthur plumbing class is here illustrated. In the foreground is some work done by Thos. Peckett including a six-way outlet, traps in one and two pieces and a knot trap.

tests. The practical examination consisted of the wiping of 4 inch joints, 2 inch underhand joints, branch joint of 45 degrees, also making bends on pipe. Examination on theory required the pupils to answer twenty questions as applying to the rules and regulations covered by the city of Port Arthur by-law in respect to plumbing. The chart examination was given from Starbuck & Sons charts.

It is little wonder then that growing up in Port Arthur are boys who are to be a success at their chosen calling. Today they have advantages for nothing that boys a few years back would have paid hundreds of dollars to obtain. Mr. Peckett's work is appreciated in this community.

WILL TEST BYLAW IN COURTS

Winnipeg, Man.—The new plumbing bylaw recently put in force in St. Boniface may be tested out shortly in the courts. Partridge & Halliday, plumbers, have intimated in a letter that court action would ensue if this firm was not granted a license to operate. This license was revoked by Plumbing Inspector F. P. Jones on the ground that the firm did not live up to bylaw requirements. Mr. Halliday, of the firm in question, declared that the practice found undesirable had been carried on by him for the past ten years in Winnipeg without any complaint.

Field of Profit in Swimming Pool Business

Pointing Out Immense Advantages of Swimming Pools and Inadvisability of Constructing Pools Without Filtering Systems Gives Plumbers a Big Opportunity

ST. JOHN, N. B.—Plumbing contractors of the maritime provinces are awakening to the fact that in the installation of swimming pool connections, and swimming pool filtration systems, there is a field of profit. In the United States plumbing contractors have seen the possibilities of this field for many years.

Some years ago there was but one swimming pool in the city of St. John and that minus a filtration system. It was in the Y. M. C. A. building. Since then a pool was constructed in the Y. M. C. A., the plumbing work on the pool and six shower baths having been done by W. B. McDonough, of St. John, plumbing and heating contractor and owner of a plumbing supply store on Charlotte Street. A new pool is under construction in St. Vincent's School, St. John, the plumbing work on the pool and twenty shower baths being in the hands of G. & E. Blake, of St. John. A filtration system has been installed in the Y. M. C. A. pool by David Peer, of St. John, plumbing contractor. Mr. Peer did the work without previous experience, the directions being terse and explicit. A pool will be constructed in the St. Peter's School, St. John, some time in the future, this building having

recently been opened. R. Chestnut and Sons, Limited, of Fredericton, N. B., installed the plumbing and heating, including ten shower baths.

There is ample opportunity for plumbing contractors to profit materially by instituting a campaign in the maritime provinces looking to the building of swimming pools and installations of filtration systems. The city fathers of the maritime cities and towns have been strangely deaf to this angle of health preservation and cleanliness, as well as conservation of life.

By pointing out the immense advantages of swimming pools and the inadvisability of constructing pools without filtering systems in conjunction, plumbing contractors would kill two birds with one missile. There would be the question of taking the leadership in a worthy cause, and secondly, the question of profit. Each city and town has immense possibilities in this connection, Canada being singularly backward in the matter of swimming pools, indoor and outdoor.

APPOINT NEW TOWN ENGINEER

Port Hope, Ont.—Oliver L. Flanagan, of Toronto, has been appointed town engineer at a salary of \$2 400.

Need for Keeping Close Watch on Credits in Plumbing and Heating Business

Some Valuable Hints Passed Along to Plumbers—A Vital Factor in Business for Keeping it in Liquid Condition—Compromises Often Create Unfair Competition

By J. B. RATCLIFFE

"IF A MAN has once had his chance in a certain line of business and proves incompetent, he should not be allowed to go back again," stated J. B. Ratcliffe, in an address on "Credit." "It was considered better for all concerned that he stay out of business if he has once exhibited, or demonstrated, his incompetence. However, this is a situation which is impossible to control. As there are new suppliers going into business all the time, and moreover, there is no law to keep a man out of active participation in any line of commercial activity."

Continuing to refer to this vital subject, Mr. Ratcliffe stated that 38 per cent. of business failures are due to incompetence.

Largest Credits in History

That credit occupied a most important part in the affairs of the world to-day, was illustrated by the speaker in citing pertinent examples. The French were occupying the Ruhr district on account of the German credit situation. The strained relations between Great Britain and Turkey were primarily caused by the same reason. "Credit is the most discussed question in the world to-day, as well as the most important. The amount represented by the word Credit, is also the largest in the history of the world; billions of credit being as common to-day as millions were a few years ago.

"The chief factor on which credit is based as between nations, is the ability to pay by exports. An illustration of this was the fact that the pound Sterling rose during the past year from \$4.20 to \$4.80, while the Canadian dollar as valued in New York rose from a discount of 15 to 18 per cent., to par; but the total wealth of these countries did not increase, it probably decreased through deflation in values. On the other hand, in mercantile credits, the chief factor is surplus wealth; not the assets shown on the balance sheet. We often find that these will shrink, especially at creditor's meetings.

Aids for Rough Times

"In analyzing the balance sheet, the first point is, has stock been figured at the replacement value? Then there should be a proper reserve for accounts and bills receivable. Real estate was considered as a liability, except that being used in the business. Another point to be carefully weighed was, how do liabilities compare with the value of the stock?"

The speaker also pointed out that a large liability to the bank was generally undesirable as the bank may clamp down the lid pretty tightly in this respect at any time. On the other hand a liability with suppliers was more likely to be of assistance in tiding the business man over the rough spots.

"Other factors to be considered from a credit man's viewpoint were, (1) character, on which some place a good deal more reliance than capital (2) business ability, which is risky unless character is O.K., (3) intuition, or common sense on the part of the credit man, and (4) local laws, are of more or less importance, as in some cases specialized legislation has tended to foster carelessness and indifference on the part of the debtor.

"There are some merchants who send to credit men a copy of their financial statements, and this practice is becoming more general, but they usually come from the ones who need to follow this idea the least. Credit men would be well advised to insist upon financial statements if accommodation is desired and the amount is of any moment."

Mr. Ratcliffe stated that the collecting of accounts was a very interesting game; a matching of wits, in trying to find out the way to make the debtor pay and feel good about it and still want to buy your goods. "What credit man," he stated, "does not know all the various tricks and schemes resorted to by those who wish to gain time, or otherwise take advantage of the situation?"

Special attention was paid by the speaker to the debtor who doesn't pay in full, who asks a compromise.

(Continued on page 19)

Cool displays will attract most attention in the hot weather. Hence such displays as this have pulled good mid-summer results in the sale of bathroom accessories. Such sales have brought many good prospects for larger installations of both plumbing and heating equipment too. In this way the summer doldrums can be chased away and the hot months turned to good advantage.

Stimulating Mid-Summer Business

Good plumbing

deserves good care. Nothing else in the home is as essential or used as much by as many different persons. Do not drop paper, string, hair or pins into the fixtures. Flush your sink with ten gallons of hot water once a week. If good care does not keep your plumbing in good condition—it is not good plumbing; and we can replace it, inexpensively, to your advantage.

Running Water on Farm and Early Fall Heating Featured in Display

Big Possibilities in Both These Fields of Business—Economical Heating Plants for Small Homes

RUNNING WATER ON THE FARM

NO. 119. "The Mysterious Fountain." Where does the water come from? Here is a display that will attract a good deal of attention by creating a desire in the mind of the passerby to know just how it operates and where the water really comes from, and by so doing arouses an interest in the farm water system, which occupies the back ground of the window.

This background is simple, yet attractive. Cover the back of your window with some sort of deep yellow cloth—draped to hang in loose folds. About four feet in front of this, drape heavy black cloth so as to secure the curtain effect, as in illustration. Place a farm water system in the center of the space between curtains, on a box about fifteen inches in height as illustrated; and you have your background. Several lights, behind the curtain, reflecting on system, will help the lighting effect.

The mysterious fountain is easily constructed. All you need is a bucket, a water gauge glass, and a faucet. Any style faucet will do. Suspend the faucet in mid air by some very fine wire. Place the bucket directly beneath it. Now place two strips of wood inside the

bucket so they will fit cross ways, bore a hole the size of the gauge glass one over the other in each strip. Place the gauge glass through the two holes in an upright position with one end in the faucet out of sight and the other end in the bucket out of sight from the street. Your water supply and waste can be brought up through the bottom of the bucket. Connect the supply to the end of the water glass and turn on the water. Be sure you have enough force on the supply and enough clearance between glass and faucet so that when water passes up through the glass into the faucet, and then falls back down on the outside it hides the glass. Plug regular supply end of faucet to prevent water from running out that way.

The cards for this display read as follows: Running Water Like Magic for the (Bath) — (Kitchen) — (Laundry) — (Garden)—(Barn)—(Garage).

ECONOMICAL HEATING PLANT FOR SMALL HOMES

NOW is the time to prepare for the fall heating rush. Display No. 120 will give you an idea as to a way of securing prospects for small heating plants. It is very simple in

construction and still puts over one big idea for an economical way of heating small homes. Place your heating plant in the window at about the same angle as the one in the illustration. Then take a strip of beaver board four feet long and twelve inches wide; cut a large key out of it, and have your sign writer letter this phrase on it: "THE KEY TO HEATING ECONOMY." Now cut a circular piece of beaver board about thirty inches in diameter, paint a key hole in the center large enough for the key to fit in. Fasten the key to the heating plant, pointing towards the key hole as in the illustration. Paste the show cards around the key hole as illustrated, and the display is finished. If you desire a more pleasing effect purchase six yards of cretonne from the department store and drape it through the key as shown above.

The cards around the key hole read as follows: "ECONOMICAL," "CLEAN," "PERMANENT" and "SAFE." The narrow card at the bottom reads thus: "OUTSIDE TEMPERATURE BELOW—INSIDE TEMPERATURE ABOVE—PAR." The large card on the floor reads as follows: "HAVE SPRING IN YOUR HOME DURING WINTER—ORDER YOUR HEATING SYSTEM NOW BEFORE THE FALL RUSH."

TWO ATTRACTIVE WINDOW DISPLAYS

Suggested window displays for plumbers and heating engineers, dealing with two seasonable subjects.

Want Receipt and Bank Cheque Taxes Off

Dominion Board of the Retail Merchants' Association in its Annual Convention at Montreal Last Week Express Themselves as Opposed to Both These Taxes and Would Like to See Them Entirely Removed—Every Province is Represented

By special staff correspondent of Sanitary Engineer

REMOVAL of receipt tax and bank cheque tax is aimed at in an important resolution passed at the 18th annual convention of the Dominion Executive Council and Dominion Board of the Retail Merchants' Association of Canada, held in Montreal last week. The opinion of the convention was that notwithstanding that some reduction has been made by the Government in the maximum tax on bank cheques, in view of the increase in the amount of the sales tax the other two taxes should be removed entirely as the present system discriminates unfairly against the average citizen and merchant. The members of the Council are urged to do everything within their power to have these taxes removed.

In the three days' session of the convention an unusually large amount of business connected with the work of the Association was transacted, some idea of the wide scope of the organization being gleaned from the President J. A. Banfield's address on the activities of the past year. In this he referred to the unfortunate litigation which the Association had been compelled to carry on for the protection of its members because the amendments to the Special War Revenue Act passed at the 1922 session of the Federal House were clothed in language which was ambiguous, and lent itself to departmental rulings which conflicted with the spirit of the Act and compelled large numbers of retailers to take out manufacturers' licenses and pay taxes out of all proportion to their business. Out of thirty cases taken before the courts no two judgments were rendered alike, which fact proved the Association's contention that if legislation of this character affecting practical retail merchandising, was passed, the Association should be given the opportunity to explain its practical effects upon business in order that annoyance and confusion might be eliminated.

Gaining in Prestige

Referring to the growth of the Association and the fact that it had now reached its 27th year, and was thoroughly representative of every line of retail trade in Canada, the president congratulated the convention upon the measures of prestige which the Association now enjoyed both before the public and Legislative Assemblies. Pointing out that the Association's work was increasing in the Legislative field the President recommended the creation of legislative committees of As-

GEORGE S. HOUGHAM

Who has been appointed special Dominion representative in the Retail Merchants' Association.

sociation members throughout Canada whose function would be to keep members of the Federal House in their respective constituencies informed upon legislation in which the retailers were directly interested. In emphasizing the necessity for the creation of such a

OFFICERS ELECTED FOR DOM. BOARD 1923-24

Election of officers for the coming year resulted as follows:

Re-elected as President—J. A. Banfield, Winnipeg.

By acclamation, First Vice-Pres.—J. G. Watson, Montreal.

Second Vice-Pres.—J. T. Crowder, Vancouver.

Third Vice-Pres.—S. E. Fawcett, Saskatoon.

Fourth Vice-Pres.—W. G. DeWolfe, St. Stephen, N.B.

Fifth Vice-Pres.—W. J. Hopgood, Halifax.

Sixth Vice-Pres.—N. T. McDermid, Calgary.

Seventh Vice-Pres.—J. P. Gordon, Charlottetown, P.E.I.

Treasurer—Henry Watters, Ottawa.

Dominion Secretary—E. M. Trowern, Ottawa.

committee the President here took occasion to express his conviction that retailers should take an active interest in local, Provincial and Federal public affairs.

Quebec Retailers Joining

The numerical strength of the Association as shown in the report of Dominion Secretary, E. M. Trowern, indicated a large increase in Quebec with conditions about stationary in the other provinces. Nineteen thousand letters went out of the Dominion office, which together with trade bulletins and questionnaires upon over fifty different subjects, amounted to a total mail output of fifty thousand pieces. Reference was made to the unique plan of organization under which the R.M.A. of Canada operated, the point being brought out that inquiries from other trade organizations both in Canada and other countries had been received through the mail and by personal representation. During the year the executive offices of the National Shoe Retailers' Association decided to unite with the R.M.A. of Canada becoming a trade section thereof.

Secretary's Report

The secretary's report was largely a review of recent legislation of interest to the retail trade and referred particularly to the sales tax act, the stamp tax on receipts, and legislation having for its object the restriction of trade combines. With special reference to the Sales Tax Act the secretary stated that the special committee representing a number of trade sections as well as members of the Dominion Executive Council waited upon the Board of Customs and strongly presented to them the necessity for placing the tax upon the article at the point of manufacture or importation instead of at the point of distribution and made a number of other suggestions which received the favorable consideration of the Board, the association having the satisfaction of having many of the recommendations adopted and embodied in the present Act which will come into effect January 1, 1924. There were still some clauses in the Act, however, which are not clear and the association is now directing its attention to having such points cleared up, and as soon as an understanding has been reached with the Government upon these matters a bulletin will be prepared and sent out to all members.

Partially Successful

Referring to the association's objection to the stamp tax the secretary expressed regret that our representations

had only been partially successful. One point, however, has been conceded which is, that in future only Inland Revenue Stamps will be accepted on cheques and drafts—which means that Post Office receipts from the sale of postage stamps will not be artificially inflated as they have been in the past. The association has also been successful in having the statistics compiled and issued covering the cost of living in Canada, under the direction of the Department of Trade and Commerce, which department was co-operating with the Head Office in Ottawa with a view to securing reliable information from competent and responsible sources.

The secretary's report stated that a special classification committee appointed to consider and revise proposed Canadian freight classification No. 17 had favorably considered the objections raised by the Association's representation on this committee to the proposal to increase minimum carload rates which would have increased the cost of retail consignees.

Claim Not Practicable

Referring to a resolution passed at the previous convention requiring an amendment to the Income Tax Act permitting subscriptions and donations to be charged against the profits of a business the secretary reported that the department had pointed out that such an amendment was not practicable because an individual working on salary is not permitted to charge up his donations as a deductible exemption from his assessment, and that therefore could not claim a privilege which could not be extended to an individual.

Stopped Speculative Systems

A comprehensive report was submitted by the secretary which was in effect a review of legislation over a period of 35 years beginning with Section 498 of the Criminal Code and ending with the appeal of the Association to the Privy Council in the matter of the injunction issued against the late Board of Commerce to prohibit it from fixing prices. The report covered broad and complicated questions of trading policy and the statement made by the secretary that the successful appeal to the Privy Council had resulted in freeing the retail trade of Canada from irritative and confusing legislation leaving the organization in a position to work out a trading policy as between manufacturers, wholesalers, retailers and consumers, equitable to all parties concerned was received with enthusiasm by the Convention.

Co-operate With Women's Council

A special report was also submitted covering negotiations between the Women's Economic Department of the National Council of Women which negotiations have resulted in a plan of co-operation being evolved under which the Women's Economic Department will be able to co-operate with committees of the association throughout Canada upon such subjects as false representation of

goods as to price and quality, the character of advertising in the press, adulteration of food stuffs, qualities of meats offered for sale, the difference between pure woollen goods and woollen mixtures, between properly and improperly prepared pharmaceutical prescriptions, real and imitation leather, jewellery, etc., etc. It was a subject for gratification said the secretary that the Council of Women had appealed to the R.M.A. for co-operation in these matters on the ground that they understood that the objects of the association were to advocate honest goods and honest methods of trading.

Those Present

The accredited delegates were as follows: J. A. Banfield, Dominion President, Winnipeg; J. T. Crowder, Vice-President, Vancouver; N. T. McDermid, Vice-President, Calgary; S. E. Fawcett, Vice-President, Saskatoon; J. G. Watson, Vice-President, Montreal; W. G. De Wolfe, Vice-President, St. Stephen, N.B.; W. J. Hopgood, Vice-President Halifax, N.S.; W. A. Stewart, Vice-President, Charlottetown, P.E.I.; E. M. Trowern, Dominion Secretary, Ottawa; Henry Watters, Dominion Treasurer, Ottawa; J. E. Sansregret, President, Quebec Provincial Board, and W. Lapoint, Secretary, Quebec Provincial Board; A. E. Everett, St. John, N.B.; A. A. McIntyre, St. John, N.B.; A. J. Reid, Shenacadie, N.S.; J. R. Dixon, Ottawa, Ont.; B. W. Zieman, Preston, Ont.; W. P. McCulley, Stratford, Ont.; D. W. Clarke, Toronto, Ont.; C. F. McArthur, Russel, Ont.; C. H. Chandler, Charlottetown, P.E.I.; J. Filiatranet, Montreal; Joseph Elie, Montreal; E. Saurie, Montreal; J. F. Grant, New Glasgow, N.S.; G. E. Hughes, Charlottetown, N.S.; J. A. Trudeau, Sherbrooke, Que.

Provincial Secretaries present were W. C. Miller, Toronto, Ont.; Miss F. P. Alward, St. John, N.B.; J. C. Doyle, Halifax, N.S.; B. R. Halmon, Charlottetown, P.E.I.; W. L. McQuarrie, Saskatoon, Sask.; M. J. Lapointe, Montreal, Que., and Geo. S. Hougham, formerly secretary for British Columbia and now special representative for the Dominion Board.

Passing of Resolutions

A large number of resolutions were passed by the Dominion executive, including many that have already been referred to in the columns of this paper. These resolutions were covered in the reports of the various Provincial associations, and were given their final endorsement at this convention.

The Manitoba Association presented a resolution to the effect that whereas freight classifications are changed from time to time by classification committees and whereas these classification committees consist of representatives of the Canadian Manufacturers' Association and Board of Trade and whereas the retail trade is not represented on these committees, therefore be it resolved that the Dominion Executive Council take whatever steps are necessary to secure representation on these classification Committees so that the interests of the

retail trade will be properly protected throughout Canada.

The Meaning of Profits

Another resolution dealt with the meaning of profits made by retailers. Because of the practice of designating as profit the margin the dealer gets, it was pointed out, and whereas profit is the excess of the price received over the cost of purchasing and handling or of producing and marketing goods, and margin is the difference between the cost and selling price of an article taken as that from which expenses be met, profit derived, etc., it was urged that manufacturers, wholesalers and retailers use these terms only in the sense that they have thus been defined and especially that in advertising literature sent to retailers the word margin be used instead of profit and percentages of margin be figured on the selling price instead of the cost price.

In view of the fact that the railway commission approved of advances in express rates during the war, upon the understanding that same would be reduced when the war was over and as no such reduction has been made, the Executive Council was requested to take up this matter with a view to securing a satisfactory reduction in rates.

Finishing Photographs

Other resolutions passed were:—

Whereas we are of the opinion that the finishing of photographs should not be considered as manufacturing. We recommend that the Association be requested to take up the question of the removal of the sales tax as applied to the finishing of photographs. In view of the fact that many are not paying the taxes and because there is doubt regarding the liability of such dealers to such a tax and further because of the tax having already been paid on the films and photographic paper.

That this Convention expresses its satisfaction at the change made by the Federal Government in the form of the one cent copper piece but also expresses the opinion that the new five cent piece should be withdrawn from circulation and be replaced by the old Canadian nickel.

That it is the opinion of this Convention that when retail merchants or other persons invest their money in wholesale businesses and conduct them on legitimate wholesale lines that the manufacturers should recognize and deal with them on a wholesale basis.

Whereas many overcharges for freight are due to expense bills showing a greater than the actual weight of shipments, therefore be it resolved that manufacturers and wholesalers be requested to co-operate by marking the weight on individual packages and boxes when goods are being weighed out for shipment and that the Dominion Executive Council be requested to take action with this object in view.

The Convention commended the Government upon the passage of the Chinese exclusive act and recommended

Tinsmithing and Sheet Metal Work

Pattern for Furnace Boot Used Where Round Leaders are Transformed to Connect with Wall Stacks

Shows How Boots Around Ceiling Beams or Parts of Foundations Encountered are Formed

Written for Sanitary Engineer by O. W. KOTHE, Principal, St. Louis Technical Institute

IN INSTALLATIONS of furnaces, a great variety of fittings are used, and especially where the round leaders are transformed to connect with the wall stacks. This is especially so where ceiling beams or parts of foundations are met with, and peculiar off-sets must be developed. The main idea is to design these boots so that they will have a gradual flow of air, producing no back pressure and doing away with all the friction possible.

In this case we first draw the elevation setting the square a rectangular base in this position, and giving the round base its proper position, after which the outlines are connected. Very often a miter line is developed in the

rectangular part as at B and C as in this case. Other times this line is left parallel with the base, which makes it a little easier for developing. From points B-C and from 7-1 we drop lines across the center line of plan and thereby draw the circle and the rectangle to represent the size of pipes we will use. Divide the circle of plan in any number of equal spaces, and then draw lines to the corners B and C as shown. These triangular lines can also be erected into elevation, but are not exactly needed, since they only show the position of the lines on the surface of the fitting.

To set out the true lengths, draw any line as C'-O and with dividers pick the

lines from plan as C-1; C-2; C-3; C-4, and set as C'-1-2-3-4 in diagram. Next from point D of elevation, project over a line as shown. After this pick the lines B-4; B-5; B-6; B-7 and set at B-4-5-6-7 in diagram. Also pick the seam line 7-D of plan and set as B-A in diagram. To set off the pattern, draw a line as C-E equal to C-E of plan, and then use true length O-1 and using C and E in pattern as center, strike and cross arcs in point 1. Next pick one of the spaces as 1-2 from plan and using point 1 in pattern as center, strike a small arc as at 2. Then pick true length O-2 and using C and E as center, cross arcs in point 2. Next pick space 2-3 from plan and strike arcs 3 in pattern, and cross this arc with line O-3 of diagram. Repeat this and establish point 4 in pattern. Then pick the miter line B-C of elevation, and using C and E as centers, strike arcs as at B and E. Then pick true length O-4' from diagram and using points 4 in pattern as center, cross arcs in point B and F.

From here on, use B and F in pattern as centers, and continue the development until points 7 are established. Next pick half the width as A-D from plan and using B and F as centers,

strike arcs as at A. Then pick the seam line O-A from diagram, which is the same as B-7 from elevation, and using point 7 in pattern as center, cross arcs in point A. Join all the points where arcs cross with lines, allow edges for seaming, and the pattern is finished.

NEED FOR KEEPING CLOSE WATCH ON CREDITS

(Continued from page 13)

"A lot of this is being done nowadays, and much of it is unnecessary," he claimed. "It seems to have been added to the list of 'get-rich-quick' schemes by some. Unfair competition to the other merchants carrying on an honest endeavor in that particular line of business is caused by stock which is bought in at 30 or 40 cents on the dollar. This is a very live subject among retailers at the present time. Composition settlements should not be accepted, except for good reasons, and when there are good prospects that the account can be saved to the trade.

"A noted exporter of goods said recently that, 'No one was safe to sell to.' This statement, however, is overdrawn, but it is nevertheless a fact that many old and supposedly sound firms have been in difficulties during recent months because they were unable to stand the double strain of deflation and frozen credits.

"Failures in Canada last year totalled 3,695, or approximately twelve every working day. The total liabilities of these business firms was around \$78,000,000. This entails a loss averaging seventy cents on the dollar, or \$54,600,000 lost to suppliers in this Dominion during one year. This condition can be improved to some extent by credit men, but, of course, can never be entirely overcome.

"Babson says: 'Different departments should guide or control the business at different stages in the business cycle. The purchasing department should be in control on a rising market. The sales department should come to the fore when prices are at the top. The work of the credit department comes in when a slump in trade is apparent. Then is the time for sane credit, not wholesale collections regardless of where or how it is done.

"Judicious use of credit is more necessary and skilful supervision is more essential on account of present-day business methods. Business institutions are anxious to keep up the volume of sales. Merchants doing a credit business are anxious to make sales. The work of the credit man comes in here, in watching new accounts and not overlooking old ones. Don't sacrifice safety for volume. Keep the eyes on bad debts, rather than concentrating entirely on sales-volume. And above all forget the

big years of 1919-20. They were abnormal times. Volumes to-day should find comparison with 1915-16, as these represented more average conditions.

"We must adjust our ideas to more normal conditions," claimed Mr. Ratcliffe, "as our businesses are being adjusted in spite of ourselves."

Simplification of Registers, Furnace Pipes and Fittings Recommended

Resolutions Adopted at Convention of Sheet Metal Contractors and Warm Air Heating and Ventilating of Interest to Sheet Metal Workers

DECIDED progress in standardization of registers and furnace pipe and fittings was made at the joint meeting of the National Association of Sheet Metal Contractors, the National Warm-Air Heating & Ventilating Association and the Western Warm-Air Furnace & Supply Association. The sentiment of the meeting was of an exceptionally high order and it was emphasized that standardization is being adopted for the good of everyone all along the line, from manufacturer to the ultimate user. This commendable work is in sympathy with the definite progress being made under the inspiration of Herbert Hoover, secretary of commerce, so that to-day the furnace and sheet metal industry takes a place among the ninety odd industries that are going ahead in the simplification of sizes and shapes of commodities.

The following resolutions were adopted:

Resolutions Adopted

For sidewall registers:

That register box openings be at least of equal capacity to the leader pipe serving it.

That 8 x 10-in. registers have a throat $6\frac{1}{4}$ x 10% in. outside measurement, with a $2\frac{1}{4}$ -in. base extension.

That 9 x 12-in. registers have a throat of $6\frac{1}{4}$ x 12% in. outside measurement, with a $2\frac{1}{4}$ -in. base extension.

That 10-in. leader pipes have a 10 x 13 in. register having a throat $6\frac{1}{4}$ x 13% in. outside measurement and a $2\frac{1}{4}$ -in. base extension.

That 12-in. leader pipes have a 12 x 14-in. register, having a throat of $8\frac{1}{4}$ x 14% in. outside measurement and a $4\frac{1}{4}$ -in. base extension.

In connection with the above, a recommendation was adopted that 11 x 13-in. registers also be made for 12-in. pipes as optional for installations where a 10-in. leader is too small and a 12-in. pipe too large for the room requirements, under which condition an 11 x 13-in. register will serve the purpose.

That 14-in. pipes have 16 x 14-in. registers with a throat of $11\frac{1}{4}$ x 14% in. outside dimensions and a base extension of 8 in.

That registers of the same base extension shall be used, in corresponding sizes, for both first and second floors.

That a height of $2\frac{1}{4}$ in. from the floor line to the opening be recommended to register manufacturers as a standard measurement for roughing in sidewall registers.

A resolution was also adopted that furnace pipe manufacturers make only one size collar for the boot for which it is intended, viz.: 8-in. collars for 8 x 10-in. registers; 9-in. collars for 9 x 12-in. registers; 10-in. collars for 10 x 13-in. registers; 12-in. collars for 12 x 14-in. registers.

The meeting also went on record adopting a standard of one size larger over the single head for collars on boots for double head registers.

The following sizes for floor registers were adopted as standard:

8-in. pipe: 8 x 10-in. register.

9-in. pipe: 9 x 12-in. register.

10-in. pipe: 10 x 12-in. register.

12-in. pipe: 12 x 14-in. register.

14-in. pipe: 14 x 16-in. register.

16-in. pipe: 16 x 20-in. register.

This recommendation for floor register sizes carries with it the pipe sizes given with them.

A resolution was adopted that the foregoing recommendations be sent to register and furnace pipe manufacturers throughout the country for their approval and acceptance, and that a further meeting be held with such manufacturers, Tuesday, September 4.

SAYS TRADE BENEFITS BY "SANITARY ENGINEER"

"I believe anyone connected with the plumbing trade will derive a great deal of benefit from Sanitary Engineer."

"I am a comparatively new subscriber but I have found some very interesting items in the various numbers, particularly in the departments devoted to practical work. The market reports are very helpful also."

(Signed) Chas. W. Mullett,

Bancroft, Ont.

Heating and Ventilating Department

Heating and Ventilating Systems in Some Large Schools

Plenum System with Direct Radiation Only in Offices, Corridors, Shops or Special Rooms—Class Room Exhaust System—Calculating Heating and Ventilating Requirements

By JOHN HOWATT, Chief Engineer Chicago Department of Education

(Continued from last issue)

THE system described provides no place for dust or dirt to settle; air is delivered into the class rooms just as it leaves the air washer; the system is very flexible, making each group of three class rooms practically a separate unit; is adjustable to meet wind and weather conditions; adjustable for a partial use of the building and the resistance through the duct system being so very low it is found a considerable air circulation is obtained in the rooms even when fans are not in operation.

Class-Room Exhaust System

The plan used in exhausting the air from the class-rooms in the elementary schools in Chicago differs slightly from that most generally used. Cloak rooms are no longer provided. In lieu of cloak rooms, a wardrobe space about 30 in. in depth is provided along the corridor wall of each class-room. In front of this wardrobe space, sliding hyloplate blackboards are provided which are counter-balanced so they may be raised and lowered like a window sash, and when lowered, which is the normal position, drop to within 4 in. of the floor. A vent register is placed in the upper part of each wardrobe space and a duct extended to the attic and there connected to the main ventilators. The exhaust air is thus exhausted from the class rooms through a slot at the floor 4 in. in width, extending along about one-half the length of the room. This arrangement is sanitary, makes for a good distribution of air in the room, and carries all odors from coats and other clothing hung in the wardrobe directly out to the attic vents.

Wherever possible the air inlet to the class-room is located at the opposite end of the wall from the door and in the incoming air is directed across the room against the windows and about 8½ ft. above the floor line. This is found to be the proper location for this air inlet to avoid short-circuiting of the air out through the class-room door whenever it is open, and to avoid drafts on the teacher's head.

In the calculation of requirements for the heating and ventilation systems of

the Chicago public schools, the quantities of air required for class-rooms, lecture-rooms and study-rooms are based upon the traditional supply of 1,800 cu. ft. per hour per seat; assembly halls, 1,500 cu. ft., and other rooms, such as offices, dining rooms, and libraries, are calculated for a 10-min. air change; corridors a 20-min. air change; gymnasias, because of their large volume compared with the number of occupants, a 20-min. air change, and laboratories an 8-min. air change. The total air quantities thus found as used in a rough determination of the pounds of steam which will be condensed in heating the air from an outdoor temperature of minus 10 deg., to a final plenum-chamber temperature of 130 deg., it having been found by experience that with the construction and design of school buildings such as is practiced in Chicago, the quantities of air named will furnish sufficient heat to the rooms to maintain a temperature of 70 deg. indoors with an outdoor temperature of minus 10 deg., when the final maximum temperature beyond the reheaters is 130 deg. Repeated air-loss check and actual practice shows that this temperature will care for the heating requirements of an ordinary class-room.

The assembly hall is usually ventilated by a separate unit consisting of a motor-driven fan and draw through heater proportioned for a final temperature of 100 deg., the air entering through mushroom ventilators under the seats. Assembly halls are usually centrally located in the building and do not have the same proportion of exposure as the class-rooms, so the final plenum chamber temperature does not have to be as high as the plenum chamber temperature for class-room work.

Rooms that have an unusual exposure are provided with supplemental direct radiation. Rooms that it is expected will be used after the regular school hours are supplied with direct radiation for heating after the fan engines are shut down. Direct radiation is also provided in vestibules and first-floor corridors, and in other locations where cold outside drafts may enter.

Air washers are used on class-room fans wherever the buildings are located in a district in which smoke or dust may be a nuisance and in every instance the new designs provide space so that air washers may be installed later if found necessary. Every building is equipped with humidifying apparatus consisting of steam-jet humidifiers controlled by automatically-operated humidostats.

The usual tempering heater units consists of Ventos figured for an air velocity of 1,000 ft. per minute through the stacks. In the design of the sub-corridor systems reheaters are arranged for an air velocity through them of 600 ft. per minute. The boiler plants are operated at about 100 lbs. gauge steam pressure, but engines driving the blows are designed to operate the blowers at full speed at any steam pressure between 50 and 100 lbs. with 5 lbs. back pressure on the engines. The engines driving the blowers are designed to operate the blowers at full speed at any steam pressure between 50 and 100 lbs. with 5 lbs. back pressure on the engines. The engines exhaust through oil separators into the heat mains, the additional steam required for heating the building being supplied from high-pressure lines through reducing valves.

Each Fan Chamber Treated as a Unit

In general each fan chamber is treated as a unit, having its individual steam-supply lines from the boiler, return lines to the pump, pressure reducing valve and vapor lines to the roof. The room temperatures are maintained constant by automatic thermostats located in the rooms acting on double mixing dampers at the plenum chamber. Tempered air is automatically controlled by by-pass dampers located under the tempering stacks. No automatically controlled steam valves are used except on the humidifiers which are controlled by humidostats located in some typical room.

The rules of the board require class-rooms to be kept at temperatures between 67 deg. and 70 deg with a relative humidity of 40 per cent., and apparatus is adjusted to control air conditions within this range. This temperature and humidity were established from a consideration of comfort rather than a consideration of health.

Determining Boiler Capacity

When the total steam requirements are known from the above calculations, allowing two air changes per hour for leakage and after adjustment to unusual conditions that may exist in different parts of the building, the boiler capacity is found by estimating 4 lbs. of steam

evaporated per square foot of boiler heating surface per hour. This provides a rough check as to the number of square feet of heating surface required in the boiler plant, and boilers selected accordingly. Whenever a building is designed which is radically different from others, or a room has an unusual location of exposure, the heat loss calculations are carefully made in accordance with the usual system of heat loss calculation methods to determine whether the air required for ventilation will meet the requirements for heating. It has been found, however, that theoretical calculations of heat losses, while useful in the preliminary studies must be checked against practical results our extensive experience has taught us to expect.

The Draft Problem

One of the most aggravating features with which those in charge of the operation of plants have to contend is the question of draft. An ample draft properly controlled is the best fuel economizer that can be provided. This feature was not given proper consideration in past years in Chicago with the result that the draft in many of the older buildings is quite inadequate. Of late years, however, we have been fortunate in having had the co-operation of the Smoke Department in this matter, so we now have established a minimum stack height from the boiler room floor to the top of 115 ft. It is found that this provides ample draft for an ordinary horizontal-return-tubular boiler plant and with the proper damper control will make it possible to regulate the combustion of almost any grade of fuel that must be burned in this district.

Plant Operation Costs

The cost of plant operation has received the attention of trustees since the war, because it has become too large an item in the annual budget. It requires approximately 150,000 tons of coal to heat and ventilate the school buildings in Chicago each year. The maintained high price of fuel makes it of very great importance that economies in its consumption be practised wherever they can be practised without injury to the school system. Twelve million cubic feet of air are drawn from outdoors through the fan systems in the school buildings every minute, and are heated and delivered into the rooms, maintaining the temperature at about 70 deg. The average outdoor temperature in Chicago during the heating season is approximately 35 deg. When all of the air delivered into the rooms is exhausted through the vent flues to the roof, all of the fuel required to heat the air from outdoor temperature to 70 deg. is wasted, which in a climate such as is found in Chicago amounts to considerable.

Up to this time the Board of Education has in general been opposed to recirculating the air from the class-rooms, believing that it is safer from a health

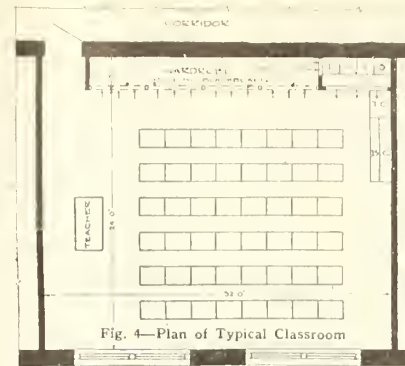

Fig. 3—Typical Sections Through Corridors.

standpoint to draw in fresh air, heat and deliver it to the rooms and discharge it directly out of doors. The Chicago Board believes in taking no chances where the health of the pupils and teachers are concerned.

Recirculation of Air in Assembly Halls

In modern school buildings, however, the assembly halls are made so large that there is considerable waste of heat which could safely be conserved. For example, the ordinary modern elementary school building has an assembly hall designed to seat approximately 1,000 people and air has to be delivered into this hall to provide ventilation for that many seats. The hall is used to capacity only two or three times per year and this 1,000-seat assembly hall is being occupied daily by perhaps not to exceed 50

people. However, because the hall is used by some classes sometime each day and because zone ventilation is not practical it is necessary to keep the hall heated and ventilated throughout the entire school session. Under such con-

ditions air enters the vent ducts in practically as pure a condition as it was when it was delivered into the hall and is of such purity it may be used in the general air supply to the class-rooms. The heating and ventilating design of new school buildings, therefore, provides for the recirculation of air from the assembly halls when conditions are such it can be done without jeopardizing proper ventilation.

The entire problem of recirculation of air is being considered by a Committee of Health and Sanitation of the Chicago Board of Education, and if this committee finds that general recirculation may be practiced under proper conditions it will result in permitting the installation of smaller boiler plants, and will result in a material reduction in operating costs.

Keeping Business Men Informed

Many Distant Canadian and United States Centres Visited Periodically by Representatives of Specialized Business and Technical Papers

SPECIALIZED business and technical papers in Canada are doing a great work for Canadian industry by collecting the ideas and methods of outstanding men and passing them on to their respective trade or technical industries.

During recent weeks, for instance, the various publications of The MacLean Publishing Company have had men in many parts of Canada attending conventions and gathering business information, as well as in a number of United States centres where conventions of international importance have been held. The fact that so much time and money is spent on gathering and publishing information of this kind illustrates the service the men in charge of these papers are putting into them.

At the present time H. T. Hunter, vice-president of the company, is studying

conditions in Europe. During May the editor of Canadian Foundryman and three other members of the staff attended the American Foundrymen's association Convention at Cleveland, Ohio. A member of the staff of Canadian Machinery attended the convention of the American Society of Mechanical Engineers, held recently in Montreal. The same publication had several representatives in attendance at the convention of the Canadian Association of Stationary Engineers in Toronto.

The editor of Printer and Publisher was present at the convention of the Weekly Newspapers' Association in Halifax a couple of weeks ago, and in August will attend the Printing House Craftsmen's convention in Buffalo.

In June the annual convention of the Saskatchewan Retail Merchants' Association was held in Regina.

Attend the Exhibition

IN THE business life of this country a place of growing importance each year is being taken by the Canadian National Exhibition. It is an achievement of great importance for Canada to have developed what is now known as the world's largest annual fair, and this great exhibition of the producing wealth not only of this country but of countries with which Canada trades, is a source of great education to business men.

This year the Exhibition is being held in Toronto from August 25 to September 8. Every retailer within reasonable distance should plan on spending a few days at the Fair. Many new features have been added this year to make it even more valuable and interesting to business men. With two weeks in which to make plans it should be possible for plumbers to arrange to spend two or three days at the Fair, and it is questionable if these days could be spent to any better advantage elsewhere.

From every standpoint the Exhibition is of great educational value to plumbers. Then there is the opportunity of meeting friends both personal and business and interchanging view on various subjects. This influence helps to broaden one's mind. Most plumbers are planning on a holiday during the hot months and even if holidays are over it will pay to take a few days off to attend the Fair.

Need Judicious Optimism

WHILE plumbers throughout the country have had plenty of experience to know that unfavorable reactions follow upon over-expansion and unjustified optimism, there has been enough talk of depression and pessimism without ringing it in unnecessarily. It would seem as though the usual bounds of discretion and caution, desirable enough in their right place, have been carried altogether too far by some in connection with reports of forthcoming developments in Western Canada.

A number of recent reports from correspondents of eastern papers and from railway and other officials have tended to dampen the optimism created by early reports of crop and business conditions. Sanitary Engineer has secured reports on these conditions throughout the Western provinces from business men of standing, whose duty it is to thoroughly analyze such conditions for the guidance of huge businesses. They have something at stake when they make a final summary of the outlook for business; they are not merely expressing an opinion which does not need to carry much weight. From a number of such business men Sanitary

Engineer has secured information that the prospects are for a bountiful crop and improved business conditions. The farmer's buying power is said to be well maintained and collections are improving in many Western districts. One other prominent business man, in an interview with Sanitary Engineer recently, stated that as a result of his investigations he had established that Canadian farmers were buying in normal volume compared with U. S. farmers, who were buying only 55 per cent. of normal needs. Yet despite this falling off in buying in the U. S. that country has been enjoying a broad expansion of business in recent months. With lower overhead costs the Canadian farmer is in a comparatively better position. There is little foundation, from present indications, for pessimistic reports. It is time for a little judicious optimism.

The Fight Is On

THE outcome of British Columbia's fight for equalization of freight rates, has such bearing upon all branches of business in the prairies and the coast province, that it will be awaited with interest. An appeal is being heard before the Privy Council this week at Ottawa, against the order of the Railway Commission of last year. The case dates back to October, 1920, when the Privy Council, dealing with an appeal of the governments of Manitoba and Saskatchewan, ordered the Railway Commission to institute an inquiry into the question of equalization of freight and passenger rates between the east and west.

One of the outcomes of the equalization of rates in the mountain zone would be that the freight on merchandise shipped from Vancouver to a point in the prairies would be equal to that on the same shipment from Winnipeg and covering the same distance in the prairies. Obviously, the result would be that British Columbia firms would be enabled to do business at prairie points which is now done by prairie firms.

The establishment of equal rates might result in considerable change in distributing conditions throughout the whole of Western Canada and therefore the matter has much of interest to plumbers.

A Retailer's "Gold Mine"

AN INDICATION of what can be accomplished by judicious advertising and a development which shows the increasingly important factor which retailers as a class are becoming in the community, is the success of the broad advertising campaign conducted by the business interests of British Columbia for the encouragement of tourists. This campaign was conducted in the territories where most travel originates, in eastern centres of population, on the prairies, and, latterly, in Southern California. The increased use of the motor car for holidaying purposes was, of course, one of the chief factors.

As result of this campaign British Columbia this summer has reached the highest point yet in volume of tourist business. It is estimated by The Financial Post that as result of this enormous travel the expenditure of transients while in the province this summer will be worth at least \$30,000,000 to B. C. With the tourist season just nicely under way representatives of Vancouver commercial organizations estimated that \$10,000,000 had been brought into that city alone. This business has been referred to as a "gold mine," but it threatens to even exceed that, judging by the fact that last year the total mineral production of the province was approximately thirty-five million dollars.

All Selling is a "Confidence Game"

Minute Message No. 24

Written for "Sanitary Engineer" by FRANK STOCKDALE

Profit Figuring Series

THE "con" man proves that confidence of the buyer is the biggest thing in selling. The confidence he builds, however, is but temporary and is undermined by dishonesty.

PERMANENT confidence rests on honesty, integrity and ability.

The salesman who would command and hold the confidence of his customers must not abuse that confidence.

It is a thing which, if not used to further dishonest purposes, will serve as a tower of strength and service of incalculable value.

To win confidence is one thing—to hold it is another.

Win it on the right principles and it will maintain itself.

THINK IT OVER—APPLY IT TO YOUR BUSINESS

Two Well Planned Collection Letters That Brought in \$8,000

Properly Written Collection Letters Bring Money on Overdue Accounts and Help to Keep the Business Liquid—Weak Letters Fail in Their Purpose and Lose Friends for the Store

THE value of collection letters that will secure results cannot be too strongly emphasized, for, as the average hardware merchants knows, the collection of outstanding accounts forms one of the major problems in the business life of the majority of dealers.

A certain firm recently came face to face with the problem of dealing with an accumulation of some \$8,000 of old and very much overdue accounts, about 250 in number and ranging from \$5 to \$135, representing balances due on installment sale contracts covering household appliances of different kinds. These accounts had already been given careful treatment, including the mailing of monthly statements to each debtor, about 20 per cent. had been turned over to a collection agency unsuccessfully and about a third of the total number had been called on by a representative of the firm with equally poor results.

The chief accountant was ready to wash his hands of the whole lot, claiming emphatically that if the means already tried had failed, there was little use in going farther, unless the firm was prepared to take legal action against the lot.

However, it was decided to mail letters to half the list. A young stenographer was put in charge of the appliance accounts ledger and directed to type a personal letter (the first of two prepared for the purpose) to each of the "A" to "L" debtors, 113 in all, representing on Dec. 1 unpaid balances of \$3,550.11. For the purposes of this letter the young woman was given the title of "assistant to the manager," and she signed her full name to the letters written to the women and initials only and surname on letters written to the men.

First Letter Used

The first letter read:

Dear Madam:

When the manager of this department laid the card containing a record of your account on my desk and said to me, "Well, I guess there is only one thing we can do,"—I knew what he meant.

But I told him there must be some mistake—that I felt you would not care to go through an unpleasant experience just for the matter of \$35.75, the balance due on the washer you purchased here early in 1920.

He called my attention to the fact that you had not made any payments since July, 1921, a year and a half ago—at which time you paid us \$10 to apply on your account. However, I asked him to set the matter ahead until Dec. 18—and I told him that I would write you in the meantime—that I was sure you would let me hear from you in the return mail.

A short pencil note on the back of this sheet will do.

The enclosed stamped and addressed envelope is directed to me personally, because I feel that you would prefer to have your note and cheque reach my desk direct so that I may be sure to get your payment entered to your credit on our books before the 18th.

Sincerely Yours,

The 113 letters were written in spare moments between Nov. 28 and Dec. 31, and although December is generally considered a poor month for collections, this letter achieved

the following results; 43 debtors paid up in full, 34 made partial payments, 7 promised to resume payments the following month, 4 complained about the appliance they had purchased, 6 claimed error in the accounts, making a total of 94, or 83 per cent., responding.

Brought in the Cash

In money the returns were: paid in full, \$788.40, partial payments, \$369.60, a total of \$1,158.00.

The fifteen debtors representing \$606.75 who failed to respond to the first letter, received the following letter, timed to reach them the day before the date set for final action:

Dec. 16.

Dear Madam:

This is Tuesday. Day after to-morrow—Thursday, the 18th—is the day set for final action in your case.

Thinking you perhaps mislaid my letter—and maybe forgot all about it—I am taking the liberty of writing you again, for I am sure there must have been some very good reason for your failure to keep up your payments—and I know positively that you wish to avoid any needless further expense to you, and the inconvenience—and embarrassment—should you wait until after the 18th; especially when a line or two of explanation might clear the whole matter up satisfactorily.

Why not write a little note, now, while you have this in hand—and mail it with your cheque in the enclosed envelope? I'll make the proper entry in the ledger right away, so that our books will show that everything is all O. K. with reference to your account.

Sincerely,

Nine of the fifteen responded, leaving only six who paid no attention, representing \$231.47. These with four letters returned by the postal authorities undelivered, made a total of \$420.97 carried through for legal procedure.

Nearly \$8,000 Secured

Later, letters of a similar nature were mailed to the "M" to "Z" debtors with equally satisfactory results; practically cleaning up the \$8,000 in old accounts.

An analysis of the correspondence of the average business institution generally reveals an astonishing lack of common sense, not to mention a lack of knowledge of letter writing, as is clearly evidenced in this example, one of the "form letters" which been sent out earlier to the same debtors, receiving but scanty attention.

Dear Madam:

We beg leave to again call your attention to the fact that you have not paid us anything on your account for a considerable period.

We must insist that you bring your account up to date, and make payments regularly as agreed, or we shall be compelled to take other steps to ensure the collection of the balance due us.

Hoping to hear from you at an early date, we are
Very truly yours,

Even a novice in the study of letter writing would hardly expect such a letter to get results, yet executives of our largest firms are daily permitting such letters to be written and sent out.

THE PROOF

She—Why were you sitting in the window while I was singing?

He—Because I wanted to show the neighbors that I wasn't beating you.—S.E.

MISTAKEN

"Waiter, are you hard of hearing?"

"No, sir. Why sir?"

"The possibility occurred to me that when I asked for liver you thought I said leather."—S.E.

EVERYTHING BUT THAT

Notice in a Kansas hotel—"We will watch your horse, we'll hold your baby, crank your car, and argue with your wife, but we won't cash strangers' checks."—S.E.

REAL TORTURE

Wife (to home-coming husband)—"Oh, Bill, it's been dreadful here all day. That foreign couple above have been quarreling and shouting, and I haven't been able to understand a word of it."—S.E.

FOXY

Citizen—"That's my car. A thief is just giving a blowout."

Policeman—"All right, I'll go over and arrest him."

Citizen—"Sh-h-h! Wait till he gets the tire pumped up."—S.E.

THE YOUNGER GENERATION

"I have a mind to give you a whipping," exclaimed the exasperated father.

"Well, dad," replied the athletic youth, "maybe you can; but if you succeed it will be some item for the sport page."—S.E.

LEGAL HUMOR

"Hello, Mose; how long you-all in jail fo'?"

"Three weeks."

"What did you do?"

"Jest killed ma wife."

"An' you-all only got three weeks?"

"Dat's all. Den dev's gwine ter hang me."—S.E.

MAYBE HE KNEW HIM

"Bill," the poet gasped to his friend, "I wrote a poem about my little boy and began the first verse with these words, 'My son, my pigmy counterpart.'"

"Yes, yes?"

The poet drew a newspaper from his pocket. "Read," he blazed, "see what that compositor did to my opening line."

The friend read aloud. "My son, my pig, my counterpart."—S.E.

PROFICIENCY

A city business man was very keen on having proficient clerks in his employ. Before a clerk could enter his office he was required to pass a written examination on his knowledge of business.

At one examination one of the questions was: "Who formed the first company?"

A certain bright youth was a little puzzled at this, but not to be floored. He wrote:

"Noah successfully floated a company while the rest of the world was in liquidation."

He passed.—S.E.

"MURDERER WANTED"

"Well," he said, scratching his head, "it's better'n nothing, anyhow. I'm going in and ask for the job!"—S.E.

ADAM HEARD IT

The teacher was exasperated at the inattention of her class. The lesson had been on machines, and inventions had been mentioned.

"Now then," asked the teacher impatiently, "from what was the first talking machine made?"

After a lengthy silence a voice from the back exclaimed: "Please, Miss, from a rib!"—S.E.

THE STINGIEST MAN

The stingiest man we ever heard of bought his bride a nickle's worth of peppermint lozenges and took her on a trolley ride honeymoon. When they got off the car he said, "Honey, suppose we save the rest of this candy for the children."—S.E.

A HOPELESS WRECK

Irate Housewife—"Are you not the same man I gave a meat pie to last month?"

Tramp (bitterly)—"No, mum, I'm not; an' wot's more, the doctors say I never will be again."—S.E.

AN ABSENT-MINDED MAN

Lawyer—"What do you think absent-mindedness is?"

Witness (slowly)—"Well, if a man who thought he had left his watch at home took it out of his pocket to see if he had time to go back and get it, I would call him a little absent-minded."—S.E.

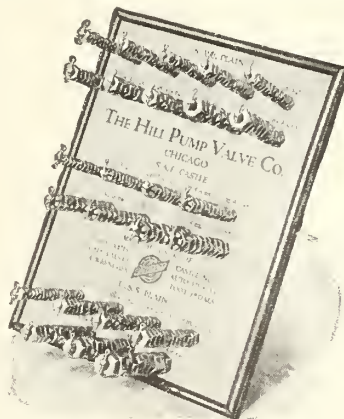

Following items are reproduced from MacLean Publishing Co. trade newspaper of August, 1903:—

"Belleville Gas Co. Ltd. are offering their plant for sale by tender."

New Goods of Interest to Plumbers

Attractive Assortment of Utility Nuts

The Utility Nut Display Board, made by the Hill Pump Valve Co., Belmont and Knox Aves., Chicago, Ill., presents in an attractive manner a practical assortment of standard semi-finished and

"Peter & Sylvester, Stratford, Ont., have the plumbing contract for the Hospital Nurses Home." * * *

"There is a dispute between the master plumbers and journeymen of Hamilton over Saturday afternoon holiday" — the recipients of a handsome travelling bag and bouquet of flowers as a token of the appreciation of their untiring efforts in making the visitors stay so altogether delightful. The presentation was made on behalf of the delegates by Geo. S. Hougham, special representative of the Dominion Executive Council.

KEEPING BUSINESS MEN

INFORMED

At the head of a very successful business in Ottawa." * * *

"Toronto building laborers have decided to return to work after being on strike 11 weeks. They return at their old rate of pay, 25 cents per hour. They struck for 30 cents, were offered 27½ cents but refused it." * * *

"What proved to be a very successful outing was the annual picnic of John Ritchie Plumbing & Heating Co., 61 Adelaide St. E., Toronto, to Long Branch. J. H. Wilson, President, presented the prizes won by contestants." * * *

"In view of the interest aroused by the decision of the manufacturers of soil pipe and fittings to discontinue the sale of light soil pipe and fittings after the end of this year the following schedule of weights is interesting." * * *

"Teams representing the Master Plumbers and the Journeymen's Ass'n. played a ball game at Woodbine Park on Saturday. The Journeymen won 8 to 4. The line ups were as follows:—Masters, J. Wright, Lynden, Menzie, Torpey, McMullen, Adams, R. Wright, Fullerton, McPherson. Journeymen, Abbot, W. Gray, C. Gray, McGee, Row, Andrews, Kemp, Abercrombie, Nicholson."

castellated nuts. The assortment is neat, economical and practical, and the board, which is eleven by fifteen inches, holds 247 nuts and may be used effectively on counter, shelf or table. As may be seen from the illustration, the sizes and types of nuts are plainly printed above each of the groups.

Isaac Church Expansion Bolt

The Isaac Church Expansion Bolt Co., of East Norwalk, Conn., have placed three lines of expansion shields on the

market, known as the "Perfect," "O.K." and "Duplex" brands.

The illustration is of the "Perfect" design. These goods are of first class quality and are claimed to have fine holding ability when properly inserted.

News Notes From Coast to Coast

Properly Written Accounts and Invoices Fail in Time

THE value of collection letters that cannot be too strongly emphasize hardware merchants knows, the ing accounts forms one of the major

WATER WORKS IS COMPLETED

The new waterworks system at Port Credit, claimed to be one of the finest west of Toronto, has been completed and will be opened within a few days. The cost of construction was \$110,000 and there will be over 300 house services.

WESTMOUNT METERS NOT RE-TESTED

Westmount, Que.—C. J. Chevrier, district inspector of the electricity and gas department, of the Department of Trade and Commerce, is taking action against this municipality for "failing to have all their electric meters retested and resealed by Federal Government inspectors every six years, as provided by the Electricity Inspection Act."

INVESTIGATE CAUSE OF MEN'S DEATHS

Saskatoon, Sask.—J. E. Underwood, civil engineer, has been spending some time in Melfort conducting an investigation on behalf of the town at the town sewage disposal plant where three of the workmen met their deaths a short time ago. Mr. Underwood was the engineer in charge of the construction on the plant.

NEW HEATING AND FILTERING SYSTEM

Kitchener, Ont.—Improvements to be made to the gymnasium at St. Jerome's College include the installation of a special heating and filtering system for the swimming tank, numerous additional showers and a thermostatic arrangement in connection of the heating so that the atmosphere of the rooms will always be two or three degrees above that of the water in the pool.

PLUMBING APPRENTICE IS ELECTROCUTED

Quebec City, Que.—Antoine Bedard, 20 years of age, employed as apprentice by the plumbing firm of Pierre Noel, was electrocuted and instantly killed while repairing a furnace in company with another apprentice. He had moved forward with the electric light so that his companion could see better, and in doing so placed his left hand on the furnace, receiving the full electrical discharge of the wire.

Doings in the Plumbing and Heating Industry

OPEN MONTREAL OFFICE

Stanley Brock, Limited, Winnipeg, has opened a Montreal office at 705 McGill Bldg., and will represent the following firms in Quebec and the Maritime Provinces: Standard Sanitary Mfg. Co., Galt Brass Co., Fred Somerville & Co., Toronto, and Never Split Seat Co., Evansville, Ind.

EXTENSION TO RESERVOIRS

Port Moody, B.C.—Extensions to the city water reservoirs are under way. A crew of men are now at work at the intake clearing out the streams that feed the reservoir, a proceeding which will add considerably to the volume of the lake. Board of Works Superintendent D. Fletcher is in charge.

NEW PLUMBING BYLAW SATISFACTORY

Kitchener, Ont.—Plumbing Inspector Zimmerman states that the city's new plumbing bylaw is working out in a most satisfactory manner. This bylaw, already adopted in a number of cities throughout the province, is the one that is urged for the entire province and may be placed upon the statutes shortly.

AMATEUR PLUMBER FINED

Saskatoon, Sask.—George Cuthbertson, engineer and handyman at the Flanagan Hotel, paid \$5 and costs in court for doing a plumbing job at the hotel and "using the tools of the trade" without a certificate from the local board of examiners, contrary to bylaw. The complaint was laid by City Plumbing Inspector George G. Taylor.

PUBLIC COMFORT STATION IS OPENED

Kitchener, Ont.—The new waiting room and public comfort station, next to the city hall, has been opened. It is of brick structure and cost \$16 000. An efficient ventilating system provides for four complete changes of air per hour in the lavatories and washrooms which are located in the basement.

MUST HAVE COMPLETE INSPECTION

Nelson, B.C.—Complete inspection of the plumbing in the house to be served and of the connection must be made in the case of all householders linking up with the new Fairview sewer, it has been decided by the city council. This will affect any people residing outside the city who desire to link up with the city system, as well as the residents.

HOSPITAL CONTRACT AWARDED

Kamloops, B.C.—The contract for the heating plant to be installed in the isolation hospital has been awarded to the Kamloops Plumbing & Heating Co., at a cost of \$600.

MAY INSTALL SEWAGE PLANT

Port Elgin, Ont.—The town council and the Board of Trade have decided to investigate the cost of installing a sewage system and are now having plans and specifications for same prepared.

BRANTFORD'S SEWAGE SYSTEM INADEQUATE

Brantford, Ont.—City Engineer Near has presented a report to the City Council to the effect that an expenditure of nearly two million dollars will be necessary before the city's sewage system will be up to standard.

DISCUSS NEW SEWAGE SYSTEM

Milton, Ont.—It is probable that the electorate of this municipality will be called upon shortly to vote on a by-law for the construction of a new sewage system, the matter being now under discussion by the Town Council who have been in consultation with engineers from Toronto.

SCHOOL CONTRACT AWARDED

Gravenhurst, Ont.—The Board of Education has accepted the tender of Lester Bain for \$61,510 for the construction of the new public school building, together with heating, ventilation and plumbing. A lower tender was made but the bidders in this case failed to furnish the required bond.

INSPECTOR'S METHODS CRITICIZED

Windsor, Ont.—Criticism of the methods used by Plumbing Inspector Abbott Ross have resulted in his sending to the critics, letters giving the facts of instances under criticism. At a recent meeting of the Finance Committee it was expected that the recipients of the letters would appear in person to make complaints but they failed to appear.

PETERBORO DISCARDING OUT-DOOR CLOSETS

Peterboro, Ont.—This city is rapidly doing away with unsanitary outdoor closets, seventy-one having been done away with so far this year. The monthly report for July of plumbing inspector G. Methers shows the total for that month was ten. Permits issued during July numbered 27, covering 17 water closets, 11 baths, 13 basins, 17 sinks and 1 laundry tub.

VOTE ON WATER WORKS BY-LAW

Fonthill, Ont.—Residents of this municipality will vote on a by-law shortly to construct a waterworks system at a cost of \$17,000.

UNIQUE STORM SEWER

Mimico, Ont.—A unique storm sewer is being laid in this town, the construction being of such a nature that the concrete top of the storm sewer will also serve as a sidewalk.

WILL REBUILD RESERVOIR

Walkerton, Ont.—An expenditure of \$20,000 will be made on rebuilding the water reservoir and putting up a small standpipe as a result of the carrying of a by-law by the ratepayers recently.

PLUMBER HAS BAD FALL

Toronto, Ont.—Walter E. Boddington, Dundas Street plumber, met with a serious accident recently from which he is recovering nicely. Mr. Boddington had a fall, luckily escaping breaking his neck in the tumble.

MILLION DOLLAR PLANT POSSIBLE

Sault Ste. Marie, Ont.—The council of the Board of Trade is considering the probability of the establishment in this city of a million dollar plant for the manufacture of oxygen and acetylene gas by a French company with headquarters in Paris.

PROVINCIAL BOARD CONDEMN WELL

Goderich, Ont.—The Provincial Health Board have informed the local water commission that the water from the new well is not fit for domestic use, and have requested a conference on the matter.

TENDERS FOR HIGH SCHOOL

Hanover, Ont.—Secretary Wm. Ruttle, of the school board, has announced that tenders will be received until August 25 for a new eight-roomed high school, costing \$60,000, the tenders being for the steam-heating, plumbing, electrical work and ventilating system.

AWARDED LARGE CONTRACT

Fort William, Ont.—J. J. Flanigan has been successful in the competition for the work of building a \$50,000 sewage disposal plant at Cochrane. Seven other contractors competed for the contract.

CALLING FOR TENDERS

Toronto, Ont.—The Provincial Public Works Department are advertising for tenders on the following jobs: steam heating for the Administration Building, Ontario Hospital, Whitby; steam heating and plumbing for the War Memorial hall, Guelph; and steam heating and plumbing of the Court House, Haileybury.

William Jeffrey, Veteran Traveller, Quits the Road

WILLIAM JEFFREY, for twenty-six years representative of the McClary Manufacturing Company, covering a portion of Ontario, has retired from the road and will take a well-earned rest. William Jeffrey was one of the best known and best liked travelling salesmen in Canada.

William Jeffrey, or "Bill" as he is familiarly known to many in the trade, will be sixty-eight years of age in October, and has been identified with the Canadian trade for the past fifty-two years. The best wishes of a host of friends for a long and happy future will go with Bill Jeffrey on his retirement from the road. He will reside with his daughter at 105 Evelyn Crescent, Toronto.

that similar legislation be enacted with reference to other Oriental peoples desiring to enter Canada.

Resolved immediate action be taken by the Dominion Executive Council to establish and put into active co-operation a Dominion wide implement trade section so that some relief for the many grievances of this trade may be secured.

The session concluded on Friday, August 10th, by meeting of the Dominion Executive Council at which important matters affecting Association administration and policy were carefully considered. The growing complexities and variety of the Association's program and the increasing demand for service from all sections of Canada necessitated the creation of new departments and in this connection the services of Geo. S. Hougham as special representative of the Dominion Executive Council have been secured.

A supplementary report was submitted by the Secretary which outlined the plan for the establishment of a Dominion-wide credit reporting and collection department under the auspices of the Retail Merchants' Association of Canada. This report was also endorsed in principle, the details to be worked out by the Dominion Executive Council.

Visiting delegates were unanimous in their expressions of appreciation of the generous hospitality and entertainments

provided under the auspices of the Quebec Provincial Board and the Montreal City Branch of the Association. M. Lapointe and Madame Lapointe were the recipients of a handsome travelling bag and bouquet of flowers as a token of the appreciation of their untiring efforts in making the visitors stay so altogether delightful. The presentation was made on behalf of the delegates by Geo. S. Hougham, special representative of the Dominion Executive Council.

KEEPING BUSINESS MEN INFORMED

(Continued from page 21)

ciation was held in Prince Albert. This was attended by the Winnipeg representative of The MacLean Publishing Company. Another representative attended the annual convention of the Ontario Branch, Retail Merchants' Association, at Brockville. Representatives of Hardware and Metal attended the convention of the Ontario Retail Hardware Association, as well as other provincial retail association meetings and also many hardware and paint club meetings in towns and cities throughout Canada. Sanitary Engineer representatives attended conventions of the Ontario and other provincial organizations of master plumbers, also many local association meetings in Toronto, Hamilton, St. John, Montreal, and other cities. Bookseller and Stationer representatives attended the annual meetings of the Canadian and American associations.

The editor of Men's Wear Review was at the recent convention in Toronto of the Association of International Designers, and in Cleveland of the International Association of Display Men. The editor of Druggists' Weekly attended last week the annual convention of the Ontario Retail Druggists' Association. A Canadian Grocer representative went to St. Andrews, N. B., a short time ago, to attend the annual gathering of the Canadian Wholesale Grocers' Association. The Financial Post has had staff men in leading centres of the Maritime provinces and Newfoundland within the past few weeks, as well as in Western Canada, and three of them have just returned from a trip through the mining districts in Northern Ontario to study the mining situation more closely. One has just returned to our Montreal headquarters from a trip to Vancouver, Edmonton, Calgary and intervening points, where he saw all important bond dealers and mayors and municipal treasurers.

All this is in addition to special visits to different parts of Canada for information that will help the readers of the various publications in their own line of work.

It will thus be seen that the MacLean publications do not depend on theoretical charts and cycles prepared at his desk by an editor who never goes out. These things are useful in conjunction with history and experience, but current facts are given first place.

Questions and Answers Regarding Plumbing and Heating Practice

Plumber Asks How to Lay a Disposal Bed in Flooded Land

Very Flat Land in His Part of the Province—Land is Submerged at Times During the Year

Editor Sanitary Engineer:

The ground in this part of Ontario is very flat, and so as to somewhat relieve and drain the land, very deep ditches are made along all the roads, drives, and provincial highways. For several weeks in the spring and fall, the land is submerged in water to the depth of several inches.

Under such conditions, the laying of a system of field tile is somewhat of a puzzler, and I would like to have some information as to how such a sewage disposal system of field tile can be laid, and any other information you can give. —Geo. E. Rogers, Brigidon, Ont.

Ans.—There is, of course, a solution to every problem, and as this is a problem no doubt to many sanitary engineers, we are answering it fully, as follows:

The septic tank must be installed a little higher up in the ground than is usual. The field tile must be laid at the same depth under the surface, not more than 18 inches, or if the ground is of gravel, or light and loamy, 18 inches from the top of the tile. But in spite of the fact that the tank must be higher, the main drain piping must be laid so that there can be no danger of flooding the syphon chamber.

The field tile in a regular system is on a level (or nearly so) with the syphon in the dosing chamber. Turn to the illustration herewith and the reader will see how the stream will feed the reservoir, a proceeding which will add considerably to the volume of the lake. Board of Works Superintendent D. Fletcher is in charge.

NEW PLUMBING BYLAW SATISFACTORY

Kitchener, Ont.—Plumbing Inspector Zimmerman states that the city's new plumbing bylaw is working out in a most satisfactory manner. This bylaw, already adopted in a number of cities throughout the province, is the one that requires the entire province and chamber. Consequently, the depth of effluent still leaves a distance vertically of about 6 inches or so about the high water mark which covers the ground at intervals.

Distance Greater Between Laterals

In an ordinary system of subsurface field tile for disposing of sewage, and where the ground is fairly loamy, it is perfectly O.K. to lay the laterals from 3 to 4 feet apart, but in this case, the distance should not be less than 8 feet

apart, and, where conditions are favourable, the field tile pipes should not be laid nearer than 10 to 15 feet from the house. If there are wells in the vicinity they should be well protected with a super-cement casing down at 6 or 8 feet and made water-tight at the top as well.

During the wet seasons, water ought to be used as sparingly as possible and all the taps on the plumbing fixtures should be in the best state of repair. It is always well to watch for leaking plumbing fixtures and not allow the W. C. to be flushed too frequently.

In making the cemented joints, the greatest of care should be taken, and all the pipes should be swabbed inside so as to clean out any rough interior obstructions.

ACID FOR CASTINGS

Editor, Sanitary Engineer.

Would you please inform a subscriber what kind of acid is used to dip cast iron castings in to make them fit for patterns. Please describe the process.

C. W. Barker, London, Ont.

Ans.—If the castings have any sand burned on them there is only one acid which will remove it and this is hydrofluoric acid. This acid cannot be held in a glass container because it will eat the glass, which is, of course, a product of sand.

For cleaning off other foreign material and softening the crust on the outside of castings, there is nothing better than sulphuric acid. Acids are to be mixed with additional water before using."

Showing How Disposal Field Tile Pipe Should Be Laid Where Land Becomes Flooded Whether Ground Is ditched Or Not & Area Is Wet Spring And Fall Seasons

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

PPRICE changes during the past two weeks have been quite numerous, as these changes have been both upward and downward, it is difficult to determine in what direction the general trend of prices points.

Crop reports from the West still maintain that conditions are very good in that line, it is noted in this connection, that a little damage has been done to the crops by black rust. In Winnipeg, pump oilers have declined in price, while melting ladles have advanced.

Ontario price advances took place on charcoal tinplates, and about 20c per box on Canada plates.

Declines occurred on scrap materials, some lines of black sheets, some lines of ready roofing, tarred, asphalt, and carpet felts, and pig iron declined to \$33.30 per ton.

A steady tone is noted in the ingot metal market, and the scrap market is still very quiet.

Collections at present are not what they should be and dealers are looking for a lot of improvement during the coming months.

A new list of differentials and extras on galvanized sheets is in use in Canada now, see Toronto markets.

Montreal Markets

MONTREAL, August 13.—Trading in the local market this week shows somewhat of an improvement over the last few weeks. Dealers in some lines report quite an active movement, while others report a quiet tone in other lines. Radiators and boilers are finding quite an active market and dealers in this line state that if the present boom in building continues an increased demand will be felt.

Eavestrough and conductor pipe are having fair sales and while business in this line is somewhat quiet at the present time dealers report that sales so far this year are considerably in excess of last year. Corrugated sheets and metal lath remain in a firm market and are showing just a fair amount of activity.

The ingot metal market takes on a quiet tone this week, showing very little change from last week, and considering the unsettled conditions prevailing generally, the steady tone shows plainly the present reasonable levels.

Collections are reported as only fair, with dealers generally not expecting much improvement until the merchants' present stocks are cleaned out and fall buying commences.

STEADY SALE REPORTED IN PIPE FITTINGS

Montreal.

Dealers in pipe fittings locally report a steady sale in this line. Prices remain steady and are quoted locally as follows:

PIPE FITTINGS—	
Cast iron fittings	10%

26 gauge	23c.
24 gauge	28c.
32 gauge	32c.
Galvani ed, 5c. per sq. yd. extra.	

IRON AND STEEL PRODUCTS REMAIN UNCHANGED

Montreal.

Bar products still remain in a steady market with prices showing no change, and quoted locally as follows:

IRON AND STEEL—

Common bar iron, 100 lbs.	3 95
Refined iron	5 45
Irish finish machinery steel	4 60
Mild steel	3 95
Single reeled machinery steel	5 50
Band steel	3 95
Sleighshoe steel	3 95
Tire steel	4 15
Harrow tooth steel	3 80
Toe caulk steel	4 85
Mining tool steel, per lb.	0 19
Black Diamond tool and cast steel, per lb.	0 19

NOTE.—Refined iron is approximately \$1.50 per cwt. over base, but fluctuates owing to unsettled market.

Band steel in scroll bundles, 50c per 100 lbs. extra.

Iron and steel 3-16 in. and thinner, 50c per 100 lbs. extra.

SOIL PIPE AND FITTINGS REMAIN STEADY

Montreal.

No change is noticed in the discounts on soil pipe and fittings. Dealers locally report a fair amount of activity in these lines. Local discounts as follows:

SOIL PIPE—

2 and 3 inch	20%
4 inch	25%
5 and 6 inch	20%
8 inch	net

FITTINGS—

2 to 6 inch	37 1/2%
8 inch	net

STEADY TONE IN INGOT METAL MARKET

Montreal.

The metal markets do not show very much change from last week and taking everything into consideration may be said to have held fairly well. Considering the unsettled conditions prevailing generally the steady tone is significant as showing the present reasonable level of prices.

Makes Sales— Makes Friends

MUELLER A-2280 Combination Sink Faucet appeals instantly to every woman—unnecessary to urge its strong points—they show at a glance—that's why it sells quickly and easily. Its many convenient uses makes a friend and a prospective future customer.

Mueller Combination Sink Faucet A-2280

(Gives water in any part of sink
—not confined to certain radius)

Lessens dishwashing drudgery—sprays flowers—cleans vegetables—fills pails on the floor—cleans the sink—and saves the woman's hands.

Raising or depressing the center knob gives hot, cold or tempered water through spout or spray.

Rapidac construction—cone seat washer—3 feet of good red corrugated hose—a high grade **MUELLER** product at a reasonable selling price netting you a good profit.

Order a sample today. Fully warranted.

H. MUELLER MFG. CO., LIMITED
Sarnia, Ontario

Water, Plumbing and Gas Brass Goods and Tools

American Factory at Decatur, Illinois, U. S. A.
Branches, New York and San Francisco

Mueller Metals Co., Port Huron, Mich., Makers of "Red Tip" Brass Rod; Welding Rod; Brass and Copper Tubing; Forgings and Castings in Brass and Bronze; also Brass Screw Machined Products.

This **MUELLER** Faucet makes it easy to wash the dishes, without making the hands red and rough.

No. A-2280 (Patented)
can be quickly installed on any regulation sink, and will last a lifetime.

LEAD.—This metal is dull and practically unchanged from last week with supply and demand fairly well balanced. The next move is not easy to forecast but it is not likely to be very pronounced in either direction. The local market is quiet at 8 cents per pound.

SPELTER.—London remains firm and East St. Louis is steady at \$6.15. Future deliveries are quoted at a premium and with the present cost of ore there is no profit for smelters. Any volume of buying would undoubtedly result in higher prices. The local market is firm at 9½ cents per pound.

ANTIMONY.—The tone of the China market is still strong but buying has slackened owing to realizing by second-hands. The local market is still firm, however, with English quoted at 8½ cents and Chinese at 8 cents.

TIN.—Considering the July statistics, which showed a decrease in the visible supply, the market did not respond quite as anticipated but is slightly higher than last week. A quiet market will probably be seen until the political situation is cleared up to some extent. The

local market is steady at 45 cents per pound.

COFFER.—The New York market is slightly easier without any pronounced selling pressure. London holds very well and this metal would probably respond quickly to any favorable use. The local market is quiet at 20 cents for electro and 19½ cents for casting.

TRADING IN ENAMELLED WARE REPORTED AS FAIR

Montreal.

Dealers in enamelled ware report business as being fair. Prices in this line remain steady at levels established some time ago.

ENAMELLED WARE—

Less 30 per cent.			

Toronto Markets

TORONTO, August 13.—During the past two weeks many local price changes have taken place. Declines occurred on some lines of black sheets, ready roofings; tarred, asphalt and carpet felts; pig iron declined from \$34.05 to \$33.30 per ton, while scrap materials took quite heavy declines on almost every line; this market still being very dull. An advance of 20c per box took place in Canada plates, and charcoal tinplates also advanced slightly.

A new Differentials and Extras List, affecting galvanized sheets, is in force now, a copy of which is given in weekly markets following.

CHARCOAL TINPLATES ADVANCE SLIGHTLY

Toronto.

A slight advance in charcoal tinplates has been made. All other lines of tinplates remain as before. Current prices are given herewith.

ADVANCE IN CANADA PLATES AMOUNTS TO TWENTY CENTS

Toronto.

Canada plates have advanced in all sizes twenty cents per box. This rise took place in the U. S. A. some time ago and it is evident that distributors in Canada have been running on goods which were purchased some time ago, and they did not raise their prices until their stocks of low-priced plates were used up. Current prices are as follows:

CANADA PLATES—

PIG IRON DECLINES TO \$33.30 PER TON

Toronto.

The price of pig iron which was \$34.05 was very well maintained considering the condition of business lately and the fact that furnaces were piling up large stocks, but the last two weeks has seen an easing off in price to \$33.30 per ton. PIG IRON—(Price per ton)—
In ordinary quantities 33 30

DOMINION WIPERS ADVANCE IN PRICE

Toronto.

The prices of Dominion wipers have advanced about 10 per cent. The colored wipers are selling at 15 cents per pound and the white at 19 cents.

Tarred Felt, 7, 10, 16 oz.....	3 45

NEW IRON AND STEEL BAR EXTRAS LIST IN FORCE

Toronto.

The new iron and steel bar extras list which is effective in U. S. A. is now effective on shipments coming to Canada from U. S. A., and also on shipments from Canadian mills, having been put into force by the latter, last Friday.

On some sizes of small rods the difference in price amounts to as much as an advance of 50 per cent. and in some cases even more over former prices on small sizes. This readjustment was found necessary as on some of the smaller lines it was found that they were costing more to turn out than the list covered.

Reinforcing and commercial bars are selling in greater volume than in July, but holiday season and summer dullness are still felt to a marked degree.

After September 15th business should show some improvement in the steel line. Some lines of steel and iron bars have declined slightly from former levels, but the difference is not great.

IRON AND STEEL—	Per cwt.
Bars, steel..... base	3 75
Bands, 3-16 in. and lighter.....	4 25
Hoops heavier than 1 in. x 20G.....	5 50

See Our Exhibit of "Banner" Furnaces

Stove Bldg.

Toronto Exhibition, Aug. 25th—Sept. 8th

The Banner Pipeless Furnace.

- provides 70° warmth in any house in the coldest weather.
- has no pipes to cause dust or dirt.
- cuts fuel bills 1/5.
- heats every room in the house through one register.
- can be installed in any house—old or new—in less than one day, without cutting walls or partitions.

A visit to the fine exhibit of Banner Furnaces in the Stove Building will be well worth your while. There, graphically, will you view the mechanical perfections of the Famous Banner Line of Pipe and Pipeless Furnaces.

Thousands of visitors will receive daily much valuable information regarding Banner Furnaces. Many of them probably live in your own territory. You will be able to profit quickly by the educational propaganda thus spread. It will be easier to convince prospects who have seen the Banner Furnace for themselves.

Visit us in the Industrial Building. See for yourself why Banner Furnaces are enjoying such nation-wide popularity. If you are not already a Banner Representative in your town we have an especially attractive proposition for you.

Come to the Exhibition. Come to the "Banner" Exhibit

6 in. in 10 ft. lengths, list	58 80
Less 65 and 5 per cent.		

CONDUCTOR ELBOWS—

Plain, round or round corrugated:		
2 inch, list	\$ 5 25
2 inch, list	6 00
4 inch, list	10 50
6 inch, list	29 00
Outlets, cut offs, tubes and conductor hooks		
List less 50 and 10 per cent.		

Winnipeg, Man.

WINNIPEG.—There are few price changes in plumbing and steamfitting lines. Melting ladles and toilet paper show an advance, while block tin type and pump oilers are quoted at lower prices. Closet combinations continue in fair demand. Soil pipe, eavestrough and conductor pipe are ruling steady. Crop conditions continue favorable in the West and as the season advances an improvement in business is expected.

MELTING LADLES MOVE UPWARD

Winnipeg.

A slight advance is recorded on melting ladles and 3-inch is quoted at \$3.60 per dozen, 4-inch at \$4.50, 5-inch at \$8 and 6-inch at \$9.30.

TOILET PAPER SHOWS AN ADVANCE

Winnipeg.

Toilet paper, both oval and round, has moved upward. Ovals in case lots are quoted at \$6 and less than case lots at 75 cents per dozen. Rolls in case lots are quoted at \$4.50 and in smaller quantities at 60 cents per dozen.

PUMP OILERS AT REDUCED QUOTATIONS

Winnipeg.

A slight reduction is in effect on pump oilers with Union detachable spouts. The following quotations are in effect:

PUMP OILERS—Per dozen—
No. 350, tin, \$10.50; No. 351, tin, \$11.50; No. 353, tin, \$12.50; No. 355, tin, \$13.75.

BLOCK TIN PIPE AT LOWER LEVELS

Winnipeg

A decline is recorded on block tin pipe and latest quotations are 72 cents per pound.

FAIR DEMAND FOR CLOSET COMBINATIONS

Winnipeg.

There is a steady demand for closet bowls, seats, low down tanks and other closet combinations. Quotations show no change.

SOIL PIPE AND FITTINGS REMAIN FIRM

Winnipeg.

No change is noticed in discounts on soil pipe and fittings. Dealers report sales quite seasonable for these lines.

SOIL PIPE—

2 and 3 inch, list less 5 per cent.; 4 inch, list less 12½ per cent.; 5 and 6 inch, list less 5 per cent.; 8 inch, list plus 15 per cent.

FITTINGS, (Soil Pipe)—

2 and 3 inch, list less 30 per cent.; 4, 5 and 6 inch, list less 30 per cent.; 8 inch, list plus 15 per cent.

EAVESTROUGH AND CONDUCTOR PIPE STEADY

Winnipeg.

Quotations remain unchanged on eavestrough and conductor pipe, and dealers report a seasonable demand.

EAVESTROUGH—

Size 8 in. per 100 feet	6 08
Size 10 in.	6 75
Size 12 in.	8 10
Size 15 in.	11 25

CONDUCTOR PIPE—

Size 2 in., per 100 feet	7 43
Size 3 in. per 100 feet	8 55
Size 4 in. per 100 feet	10 80
Size 5 in.	15 30

QUIET TONE PREVAILS IN RADIATORS

Winnipeg.

There is no change in quotations on radiators. Business is on the quiet side but dealers are looking for a revival of trade shortly.

LEAD AND ZINC PRICES FIRM

Winnipeg.

No changes have occurred in prices of lead and zinc goods. A steady tone is maintained on these lines.

Sanitary Engineer

Dominates in Its Field

Because—

SANITARY ENGINEER is the only plumbing and heating paper in Canada giving an up-to-date market service in each issue, from Montreal, Toronto and Winnipeg.

SANITARY ENGINEER has exclusive rights for publishing in the plumbing and heating field the splendid articles by Frank Stockdale, America's outstanding merchandising expert.

SANITARY ENGINEER uses more illustrations in the editorial section than any other Canadian paper in its field.

SANITARY ENGINEER is running the most complete and practical series on sewage disposal of any publication in Canada.

SANITARY ENGINEER is the only paper running in each issue a full page illustrated article on sheet metal work.

SANITARY ENGINEER is the only paper running a classified Buyers' Guide in each issue.

SANITARY ENGINEER runs the most up-to-date news service from coast to coast, outnumbering other publications in its field by more than five to one in the number of news items carried.

SANITARY ENGINEER'S editorial policies are conducted along sane, practical lines, based upon the experience of the very best authorities in their respective lines in Canada.

SANITARY ENGINEER is printed on better paper stock than any other paper in its field, thus showing up illustrations to better advantage.

SANITARY ENGINEER is uniform as to make-up, both in its editorial and advertising pages, thus making it convenient for readers.

SANITARY ENGINEER'S news of the trade, convention notes, convention reports, articles on legislation, are the brightest, breeziest, best-written and most complete reports issued to the Canadian plumbing and heating trades by any publication either in Canada or the United States.

SANITARY ENGINEER takes the lead in providing the trade with new, practical ideas, dealer helps, and proving through the printed word that certain plans are being carried out successfully by leaders in the industry.

SANITARY ENGINEER reaches the leading members of the plumbing and heating trade by paid invitation. Copies are not sent out indiscriminately. The paper is of real practical value to its subscribers, and they willingly pay a fair subscription price for it. This ensures reader interest and attention.

SANITARY ENGINEER carries in each issue a large volume of high-class advertising, and most of the representative manufacturers and supply houses use its pages regularly to carry their messages to the Plumbers and Sanitary and Heating Engineers of Canada.

SANITARY ENGINEER maintains, in addition to regular editorial and advertising staffs, correspondents located in the most important parts of Canada, and in this way provides readers with the splendid news service which is not duplicated by any other publication.

Subscription price, \$2 per year.

Sanitary Engineer

Plumber and Steamfitter of Canada

The Trade's Favorite Paper Since 1907

153 University Avenue, Toronto, Canada

Here is a Convincing Test of Strength!

An ordinary screw secured in the keystone of an archway with a No. 14 Rawlplug **HELD FOUR MEN SUSPENDED IN THE AIR WITHOUT THE RAWLPLUG SHOWING ANY SIGNS OF STRAIN.**

And another test proved ordinary screw anchors were incapable of holding one man in the same ceiling.

This shows the unequalled superiority of Rawlplugs over all other screw anchors!

Contractors and Engineers throughout Canada recommend Rawlplugs because they are more economical, easier to handle, and more satisfactory in every way than the old type of screw anchor.

We would like you to try Rawlplugs too!

Just drop us a line for a few samples and price list. We will be pleased to send them to you.

What about those Heating Jobs?

During the past long cold winter some of your customers were not satisfied with their heating system. They suffered the intense cold through poor heating and the coal shortage.

Some of them are in the market for a new system, and will want installation this fall. Sell them a hot water system which will save them coal and give them sufficient heat.

Sell them a "Daisy" boiler and "Viking" radiators, which will give you liberal profits.

If interested, tear out this page and place with letters to be answered.

Burnham Boilers

There Was No Monkeying With the Fire Travel

The Burnham Twin Section Boiler has all the strong points of the square sectional. Most important of all, it has the same long fire travel to make its short coal bills.

It is very conservatively rated. In fact, what the Twin has done this past winter has opened the eyes of all of us. No better cast iron boiler made for low pressure heavy duty work.

PATENTED

A Suggestion

"Medium Weight soil pipe has a round bead pattern at the hub to distinguish it readily from the Extra Heavy weight pipe which has a flat bead pattern."

This is only a matter of design, one being as strong as the other.

We respectfully suggest the advisability of continuing the excellent practice of invariably specifying medium weight pipe in the round bead pattern."

TORONTO HARDWARE MFG.,
CO., LIMITED

When Does a Paper Really "Reach" You?

1.

Advertisers of the present day are continually having impressed upon them the large number of readers "reached" by this or that medium.

Altogether too much stress is laid upon the number reached; insufficient importance is attached to the manner of reaching them.

As you pass along the street a handbill is thrust upon you. You take it, glance at it, and in all probability immediately throw it away. That advertisement has undoubtedly reached you, but has it reached you in the manner in which you would like your own advertisement to reach the customers you are aiming to get?

It is this question of how people are reached that is really the important one for the advertiser to consider. It is useless "reaching" a large number if you reach them at an unsuitable time and under conditions in which your advertisement will have no effect; everything depends upon the nature of the contact. If this were not so you might as well save the expense of sending out salesmen and send out messenger boys instead. They would "reach" your clients. But you send out a salesman because a salesman is something more than mere flesh and blood. He can do your work more effectively than the messenger boy.

In the same way a publication is more than mere paper and ink. If it is the right kind of publication it is just as far ahead of the handbill or other unsuitable medium for carrying your message as the salesman is ahead of the messenger boy. It will do your work far more effectively.

This is the first of three talks designed to show you how you can satisfy yourself that the medium you choose can not only reach, but reach effectively, and under the most favorable conditions, the man whom you wish to secure as a client.

Look out for No. 2 in our next issue.

PNEUMATIC WATER SUPPLY SYSTEM

*Gives country residents all the advantages of
a city water system without the excessive cost*

The wide-awake dealer will make big profits out of this system among customers who now have difficulty with their water supply. It is so simple to operate and costs practically nothing for upkeep.

The outfit consists of an air-tight steel tank which can

be placed in the basement, and a "Myers" famous guaranteed pump (hand or power), suitable for pumping air or water, together with pipes and fittings. Any plumber or gas fitter can easily install it. Every outfit guaranteed to do the work for which it is designed. For small or large dwellings.

Write us for Water System Catalogue and prices. Now is the time to interest your customers.

"Yes, Madam, Your Husband was a Careful Investor"

*Will your banker be able to
give your widow this assurance?*

YOU do not save money for the mere joy of having it. You have a definite purpose in view. It may be to protect your own later years; to educate your children and start them out in life or to sustain your widow and dependents should you yourself pass on.

For these purposes you save—and invest what you save. It is a sacred trust. To fulfill it you must put that which you save where it will be safe, first, and produce a good income, second. You do this by investing.

Only carefully made investments will achieve your ends. Careful investing requires reliable information.

You can get this necessary sound information and advice weekly in The Financial Post.

Nine thousand other Canadian business men subscribe to it and look to it for news and advice concerning stocks, bonds, mortgages, insurance and business policies in general.

Do the same yourself. Subscribe to-day. Lay the foundation of your fortune on the solid rock of knowledge.

When you have filled in this coupon and attached your cheque for \$5 you have assured yourself of 52 issues full of meaty, intelligible, readable business and investment news. Better do it now.

It Never Fails

WHEN a Donnelly Pressure Relief Valve is installed on a hot water heating or closed plumbing system, and set at the proper point, the occupants of the building are absolutely protected against loss of life and property damage—better insurance than would be afforded by a policy from Lloyd's.

There are over fifty thousand Donnelly Pressure Relief Valves in service and not one has ever failed. Its operation is as certain as death and taxes—it's the valve you should use on every job.

Tank Insurance

Before Vitro Fittings are put into Vitro Tanks they are tested. Again, **after** they are installed in the tanks they are tested.

This double check on a product made of highest grade materials by skilled craftsmen and after passing numerous shop inspections during manufacture, is your finest tank insurance.

This mechanical perfection is encased in a Vitro Tank of softly gleaming virgin whiteness with a graceful sweep of line that bespeaks its aristocratic lineage.

There are in use in Canada to-day 250,000 Vitro Tanks, ample proof of Vitro's superiority in its chosen field.

THE EMPIRE AT THE EXHIBITION

WE ARE displaying a full line of bathroom equipment, plumbing supplies and "Empire-Duro" Water Supply Systems.

Bring your prospects, show them the superiority of the "Emco" products, the beauty of our bathroom equipment, the care taken in the manufacture of our plumbing supplies. Explain the special features of "Emco" products, why they are leaders in this field.

This is your opportunity to sell your out of town prospects on the convenience and economy of the water supply system. When they see an "Empire-Duro" in operation it will be the clinching argument on why you should install an "Empire-Duro."

Beauty
Refinement
Durability
Cleanliness
Sanitation

Every Canadian Solid Vitreous Lavatory Possesses These Qualities

SOLID Vitreous hard-burned all-clay ware is the only product yet devised by modern science possessing the highest conception of true sanitary qualities. Its uniform density of structure, its solid strength, its utter cleanliness of surface, its imperviousness to dangerous acids or germs are factors which ensure years of practical utility beyond the life of surfaced metals, fragile compositions or porous earthenwares.

EACH piece of CANADIAN SOLID VITREOUS ware is vitreous through and through. It is composed of the finest powdered clays and rocks, hard-burned, with a deep, enduring live-white lustrous glaze surface, as smooth as glass, possessing no affinity for dirt or germs, as easily kept clean as a china plate. The design of every piece has been developed with such grace and skill that beauty and refinement are in every line.

Take a Tip from the Parrot

Mechanically the parrot squawks what he is taught—repeats without variation the same phrase, the same word over and over again. Pretty soon a listener grasps what the bird is saying.

Only by constant repetition can the Sanitary Engineer hammer home to the rural dweller the doctrine—the healthfulness and comfort—of running water and sewage disposal systems.

Infuse your sales talk with the one big idea—the cleanliness and convenience of a properly installed water or sewage system.

Take a tip from the parrot; say your piece and say it often.

Install only ANTHES Soil Pipe, Syphons and Fittings.

The "New King" Sells Easier

Because

It Heats Quicker

THE amazing speed with which New King Boilers circulate heat is a source of keenest satisfaction to home owners. It is one of "New King's" finest selling points.

"New King" construction is **different**. Here's why:

Upward circulation is unobstructed and functions perfectly always. Equipped with generous sized outlets and intakes, rapid, even flow is assured at all times. With two way nipple construction water can never stagnate in the sections.

Added refinements like Improved Grate Operation and a unique Smoke Control emphasize King Boiler **DIFFERENCE**. Such distinctions make easier sales for you.

IMPERIAL RADIATORS have the qualities of rugged construction and fine workmanship that make New King Boilers famous. Install both for lifelong heating comfort.

Write for our new catalogue.

An Important Announcement to the Heating Trade

The New Clare Bros. Hot Water Boiler

On view, at our Booth in the Stove Building, Toronto Exhibition, is one of our new "Crusader" Hot Water Boilers. It contains such unique features of construction, design and operation that a close inspection will amply repay everyone who sees it. We will gladly answer any questions and explain fully its construction and special advantages.

In addition to our regular line of Hydro Thermic Steel Hot Water Radiators we have evolved a

New and Improved Cast Iron Radiator for Hot Water or Steam

Note these exclusive features:

Much lighter than ordinary cast radiators in proportion to its radiating surface.

Carries less water than ordinary type, therefore responds more quickly to the fire.

Exhaustive tests in our plant have entirely proven its strength and utility.

Come to our Booth in the Stove Building. See graphically our new Boiler—our new Radiator. If you cannot visit us write at once for literature and important information.

Urge Closer Co-Operation Between the Gas Company and Plumbers

Dominant Note of 16th Annual Convention Canadian Gas Association—Exclusive Handling of Appliances by Dealers Often Develops Into Price Proposition—An Automatic Heater Display Which Pulls Results

Report of 16th Annual Convention Canadian Gas Association, Ottawa, Ont.

OTTAWA, Ont.—Co-operation between the gas company and the dealer in the sale of domestic appliances was advocated strongly at the sixteenth annual convention of the Canadian Gas Association, held in Ottawa, August 23, 24 and 25. Over one hundred and fifty delegates were in attendance from all parts of Canada, as well as a number of officials of the American Gas Association and large manufacturers from the United States.

Col. D. R. Street, retiring president of the association, presided over all sessions, the convention being formally welcomed to the city by Mayor Frank Plant who, during his three terms as mayor of Ottawa, has been associated with the gas company in many ways.

While the majority of the addresses delivered and the problems taken up were principally of interest to the gas company in their manufacture of gas, the address of W. B. Johnson, Toronto, dealing with the sale of domestic appliances, was one that contained many points of interest and value to every dealer of appliances, particularly that portion of the address dealing with various methods of boosting business. Mr. Johnson's address follows:

The sale of a gas appliance means practically nothing to the company, but the gas used in that appliance, month after month, and year after year, is what we are interested in, and what we must always bear in mind.

As a rule, you will find that an appliance will be replaced by a more modern one when it has outlived its years of usefulness, providing it has been giving satisfactory service to the consumer.

Let us first consider the local conditions for the sale of appliances, for you will generally find one of the following methods:

FIRST: gas company selling appliances exclusively..

SECOND: dealers selling appliances exclusively.

THIRD: gas company and dealers both selling appliances. Each have their good points as well as their faults.

Let us consider the merits of the different methods.

FIRST: gas company selling appliances exclusively. This is a condition that is very seldom found now, but was quite common some years ago. Under these conditions, it would be entirely up to the company to see that they handled only such appliances as would give satisfactory service, that the appliances would be connected and adjusted properly, and at a price that was reasonable.

Consumers should have no cause to complain of the service due to the inefficiency of the appliance, for it would be up to the gas company to see that they were installed and maintained in a proper condition.

SECOND: dealers selling appliances exclusively. Except in very rare cases, this method does not prove very satisfactory to the gas company, for the dealer is chiefly interested in the profit he derives from the sale of that appliance, and does not as a rule stop to consider the service that will be obtained from same. Under this method, it usually develops into a price proposition, and some of the dealers will handle only the cheapest line they can get, regardless of the efficiency of the appliance. If you get this class of goods on your line, you

cannot expect your consumer to obtain the service he is entitled to and which he should get. You may say that it is the consumer's own fault if he purchases an inferior line of goods, but how is he to know? It is natural that he should look to his gas company as to the best appliances to install. Even if the consumer should purchase a good grade of appliance, it is liable to be connected or adjusted in an improper manner, as the dealers do not make a study of the appliances, and his fitters do not know as much about the appliances as the fitters employed by the gas company.

All this reflects on your company, for the consumer does not blame the merchant who sold him the appliances, but condemns the gas company for sending out gas of an inferior quality. Another very important point to consider is that the dealer will not get out to push the sale of appliances, but will take such as come to him the easiest, and the gas company is therefore not obtaining the in-

G. A. JEFFRIES

creased sales they should expect.

THIRD: Gas company and dealers both selling appliances. Under this arrangement, you have as many extra salesmen working for the good of your company, as there are dealers and clerks. For, if you are pushing the sale of gas appliances, they will also endeavor to sell gas appliances. Of course, you are liable to find all kinds of appliances sold and installed, but, if you preach quality in your selling talk and advertising, the public will soon come to look for same in what they buy, and if they consider price only, when purchasing an appliance, they are not so liable to blame you if same proves unsatisfactory. It is possible for any company to handle all the good lines of appliances made, so that it is easy for you to obtain the exclusive sale of one or two particularly good ones, and the dealer can secure the sale of another line of equal quality. When possible, it is well to work with the dealers, giving them the benefit of your knowledge of appliances, and the sale of the same, for they will, as a rule, appreciate it and will work with you, which means increased gas sales, and that, of course, is our goal.

Assuming that we are selling appliances, let us first consider what kind of display room or office we should have for the proper showing of our goods.

It is generally admitted that the gas company's office should be located on a prominent street, and in a location where there is considerable traffic. There is no reason why a gas company should not have one of the best locations in the city.

You should carry a good line of appliances, and same should be kept clean and well polished at all times. It is not necessary to have every appliance connected, but it is better if you can do so, although having one appliance of each kind connected will answer the purpose. It is absolutely necessary that one of each kind of water heaters carried in stock should be connected so that they can be demonstrated to prospective buyers.

The display room should be kept immaculately clean, and if you have the space, it is desirable to have a few chairs where women can sit down to rest should they be tired or ill when looking at your line of goods. Some companies fit up a rest room for the convenience of the public, and invite the ladies to make use of same for their meeting place. This has proven very successful in a great many cities.

Advertising

This is a subject that is well worthy of a paper itself, and I will not attempt to cover even a very small part of it. I do not think there is any chance to doubt but that newspaper advertising when followed up consistently, will bring results. It has proven so in all other lines as well as in the gas business. It is almost impossible to obtain an accurate check of the results to be ob-

Imported Pipe Confined to Sizes Not Being Manufactured in Canada

Market for Larger Sizes Not Sufficient to Make Manufacture Profitable to Canadian Firms—
General Conditions in Industry Not Yet Affected
by Recent Changes in U.S. Working Day

FOLLOWING a story appearing in the daily press recently of the arrival in this country of a shipment of thirty-eight miles of pipe from Scotland, for use in the gas system being installed in the city of Edmonton, conjecture was raised in some quarters as to why it should have been necessary to import this pipe when there are firms manufacturing pipe in Canada.

Enquiry of C. S. Webber, Page Hersey Tubes Ltd., however, elicited the information that this firm had sold to the city of Edmonton all the pipe needed in the sizes manufactured by the firm and that the thirty-eight miles of pipe from Scotland were all in 10 $\frac{1}{4}$ and 12-in. pipe, which sizes are not made in the Dominion.

"These larger sizes," added the informant, "are not made by us or any other Canadian firm, because the market we would have for such goods would not be sufficient to warrant our undertaking this work. Even as it is we find a limited field for the smaller, more widely used sizes that we manufacture, and have had to build up an export business that will help carry enough business to keep our furnaces going."

Speaking of the general conditions in the industry, Sanitary Engineer was

informed that the adoption of the eight-hour day in the steel industry in the United States had not been reflected in price changes or other market conditions to date. This official, who has recently spent some time in Pittsburg, the heart of the United States steel industry, made the assertion that he did not believe that the majority of the workmen, themselves, were in favor of the change, but that it was the result of an extreme minority who had advocated the eight-hour day as a matter of principle rather than as a means of bettering living conditions of the workers.

He found that the men in one plant had objected so strenuously to the new system, under which they would have a smaller earning power as individuals, that a strike was almost precipitated. Under the old system the men worked on an hourly rate and on a bonus for production. Under the new system, the new rate leaves their straight wage without much change, but their chances of earning a production bonus are so minimized as to become negligible, as it was only in the last few hours of the day that the production would reach the bonus mark, and with the day shortened it is not reached.

the industry, Sanitary Engineer was is demonstrated every day in the year. It is recognized to-day by people who should know, that newspaper advertising will bring the best results in our class of business. I do not mean to say that other kinds of advertising do not bring good results, for they all have their own value, and in special cases, might bring better results, but on the average, there is nothing that can compare with newspaper advertising.

Where you have a list of prospective customers, direct by mail advertising

proves successful. Do not think that your direct by mail literature will bring in the order, for it seldom does, but it puts the prospective customer in the proper frame of mind so that when your salesman calls upon him, he has already considered the matter, and has been partly sold.

It is claimed by many that direct by mail advertising will reduce the number of calls necessary to secure the order.

Billboard advertising is another method which is very good, providing the locations are right. One great trouble with most billboard advertising in the past, was that they contained too much reading matter. All billboard advertising should be short and to the point, and if possible should be illustrated so that a person can grasp the entire ad with just a glance, for in this day of speed and automobiles, a person only has a chance to give a fleeting look at them.

Theatre and church programs are not of a class that bring in the best value for the money expended, and do not think we should consider them as advertising. If you feel in duty bound to contribute to their support, I believe same should be charged to donations.

Window displays are very profitable method of advertising, especially if you

APPRECIATES PROMPT METHODS

Your prompt method of dealing with my subscription to Sanitary Engineer has been very gratifying to those most interested. I have, therefore, much pleasure in renewing my subscription to a magazine, the perusal of which has always been a source of much enjoyment. Wishing you every success.

H. P. SULLIVAN,
St. Catharines, Ont.

have a desirable location, and a properly constructed window. Your windows are worth at least half of your rent, so if you do not use them to advantage, you are losing money.

You all know to what expense the big merchandisers will go in fitting up and decorating their windows. Some change their displays every day, others twice a week, and practically all change at least every week, depending entirely upon the passers by.

Window displays should be properly lighted and left burning every evening until after the evening crowd has left the streets. You have all noticed how the people will stop to look at goods in a well lighted and neatly arranged window, whereas they will quickly pass by a dark or dingy looking one. The evening is the time when the public has the most leisure, and it is then their minds are most susceptible to impressions.

You will find it greatly to your advantage, if you can get a little life into your window, by having something moving in it. If you will try having a demonstrator cooking on a gas range situated in the window, you will be surprised at the number of people who will stop to look.

Another display that attracts considerable attention is to have your window fitted up with a bath tub and automatic heater connected. Then have a little colored boy in a bright bathing suit turning on the water and filling the tub, then letting it out. I have known of cases where this has attracted such a crowd that they have blocked the sidewalk.

Try the stunt of connecting an automatic heater in your window with a line running outside, so that passers by can open a faucet and see the heater in operation. Of course, you want the doors open, and suitably printed cards inviting the public to "turn the faucet and see the heater in operation."

There are any number of these live displays that can be arranged if you only think them out, and the cost is comparatively small.

Personal Solicitation

I do not know if there is anything that will obtain the results of personal solicitation. I do not only mean by the salesman who is out selling appliances, but by all employees who come in contact with the public, such as cashiers, fitters, meter readers, etc. Every employee of the company should be a booster, for a good word from them has far greater weight with the prospective customer than from the salesman who is trying to sell an appliance. If you can arrange some method of compensation, whereby an employee turning in a prospect, that is closed within a certain period, will secure a bonus or commission, you will find they will make it a point to talk gas appliance wherever they go.

Alkali in Soil Causes Corrosion of Water Mains in City of Winnipeg

Rapidity of Action Brings up Serious Problem—
Ordinary Cutting Tools Cannot be Used Efficiently
on Corrosion-Resisting Pipe—New Tools Must be
Invented to Make General Use Feasible

WINNIPEG, Man.—This city is looking for a manufacturer of water mains which will resist corrosion and at the same time not be too hard to be handled with tools, according to Prof. J. W. Shipley, who has been conducting investigations into iron-pipe corrosion for a couple of years past.

It has been found, the professor states, that iron pipe of this description in its unannealed state is very difficult to work with ordinary tools, and that the pipe cannot be used efficiently at present by the city for this reason. Not until more effective cutting tools have been invented will it be possible to bring the pipe into general use. However, if the demand for the pipe became general, no doubt it would lead to the production of the tools for handling it, it was intimated.

So the city, the professor explained in a recent lecture, has to use the centrifugally moulded pipe after it has gone through the annealing process. This makes it easy to handle, but also lowers its powers of resistance to corrosion. However, the centrifugally moulded pipe has advantages, for it is free from blow-holes and flag (foreign

material) and is also of uniform structure, light and inexpensive.

The professor showed on the screen sections of iron pipe, 250 times magnified, taken from River Avenue and other portions of the city. Some of the pieces of pipe had been corroded to such an extent that they could be cut through by a pocket knife. One of the definite conclusions drawn was that where carbon occurred in the iron in the form of graphite needles corrosion was greatest, and where it was combined as cementite and austenite it was least.

One of the admissions of the professor was that it was impossible to distinguish between corrosion caused by stray electric currents and corrosion caused by the action of soil.

It is stated, however, that corrosion from the former source is extremely slight as compared with corrosion by action of the soil, the amount of alkali in the soil in the vicinity of Winnipeg having given trouble this way on other occasions, it being recalled that steps had to be taken to draw off the moisture from the earth surrounding the cement aqueduct of the Greater Winnipeg Waterways in order to prevent the crumbling and rapid deterioration of the cement.

Outside salesmen are absolutely necessary to obtain any degree of success, but the question of population per salesman and compensation of the salesman, is something over which there is great difference of opinion. I believe local

conditions should govern in all such matters.

Time Payments

Have you ever investigated or stopped to think about how many people buy certain kinds of goods on time payments, who are able to pay cash for same if they only tried? It seems to-day that while the great majority of the people may want an article, they are not prepared to make any sacrifice in order to obtain same, and for that reason they will buy a great many things on time payments, just because they can pay it out of their monthly earnings or allowances.

A gas company is in a very fortunate position re the collection of time payment accounts, and for that reason loss of same should be very small. The secret of the time payment business is to watch the first three or four monthly payments and to get them in promptly, and the rest will be far easier. You will find where the first four payments are made promptly, the appliance is very seldom removed except for other reasons.

The smaller the initial payment, the more business it will bring in, but the lower the first payment, the closer you

(Continued on page 29.)

Instals Sixty Water Systems in One Year in Farm Homes of District

Belleville, Ont., Plumbing Firm Finds Specializing on this Line Brings Much Business—Paves Way for Sale of Labor-Saving Household Equipment—Three Bathrooms in Single Six-roomed Dwelling

PARTICULARLY in those cities and towns where the number of plumbers appears too great in proportion to the population, it is necessary for the firm that would be a leader to develop one or more specialties for which it will become well-known in the community. This has been the experience of the John Lewis Co. Ltd., Belleville, Ontario, where the installing of water systems in rural homes has been found to be a highly satisfactory specialty.

As has been pointed out in Sanitary Engineer, on numerous occasions, the number of farm homes in which there are any modern sanitary conveniences is low, leaving a large field for the progressive plumber who will go out after this business.

Wm. J. Doyle, manager of the John Lewis Co., is one of the men who is cashing in on this field, the firm having installed nearly sixty water systems in rural homes in the district surrounding Belleville during the past year as a result of Mr. Doyle's activities.

Numerous methods are used by Mr. Doyle to keep the advantages of water under pressure constantly before the farmers, one of the successful plans being the broadcasting of form letters at frequent intervals throughout the year. For this purpose the complete rural mail lists of the district are used as a mailing list, thus ensuring the reaching of every householder.

This same territory is covered in person by Mr. Doyle, following up tips regarding proposed building and buildings in the course of construction, which are secured through friends of the firm in many parts of the district, as well as following up enquiries received as a direct result of the form letters sent out.

Other Sales Follow

Of course, as might well be expected, the installation of a water system is but the first step. Then there is the sale of bathroom fixtures, water power washers, stationary washtubs, and other labor-saving equipment, which has long been denied the country housewife.

"Once you get the farmer interested in the installation of a water system, he becomes a good prospect for other equipment and goods," declares Mr. Doyle, who states in support of his claim that in nearly every instance last year where he sold a water system he also sold a complete outfit of bathroom fixtures, and in many cases much other goods. In fact, one farmer, owning a six-roomed house, became so enthusiastic over the proposition that he installed three bathrooms, one for each of the three bedrooms in his house!

Mr. Doyle is a firm believer in the value of a window trim which will faithfully represent a room as it will appear when properly equipped. To achieve this reproduction in its most effective form one of the show windows of the store has been converted into a small room, the window being made deeper by extending it back some distance into the store.

In the room thus constructed the complete fittings of a modern bathroom are

ERSKINE-SMITH & CO.

PLUMBING AND HEATING
37 WIGMORE STREET, CAN. & 470

The adaptable window display as used by John Lewis & Co., Belleville, Ont., and described in this article, is shown herewith as depicting a complete bathroom scene. This firm find that showing the complete set of equipment as it will appear when installed is one of the most effective ways of securing the interest of prospects. This room can be readily changed into a kitchen or laundry. Read how this firm follow up prospects secured through the window displays.

shown, care being taken to secure a permanent effect of the set. At other times the room appears as a modern kitchen, complete with sanitary sink, porcelain-topped table, kitchen cabinet, and other up-to-date fixtures, secured from the hardware department of the store. At still other times, the versatile room takes on the aspect of a laundry, equipped with sanitary stationary tubs electric washer, and all the other labor-saving accessories.

Another means of securing the attention of the public, is through the medium of the daily press, and in this respect, too, the John Lewis Co. have kept well to the fore, their well-written advertisements bringing in many enquiries and a good percentage of direct sales.

In a large five-column advertisement run in one of the local newspapers recently this firm devoted practically full space to an outline of the advantages of water under pressure, heading the copy in large type "Water Under Pressure; Anywhere-Anytime."

This was followed by copy which read, in part: "To bring the Canadian farm home up to the standard of modern living conditions, water under pressure is of first consideration. With this feature, comforts and conveniences are possible that will make your home in the country attractive to the family, and they will enjoy their dwelling place beyond that

of any other spot on earth. It is essentially a time and labor-saving device.

"Electric water systems, operated by electricity from farm lighting plants, furnish the equivalent of 'city water pressure'—are economical, durable, and, when measured by the service they render, inexpensive. The engine driven systems furnish practically the same service as the electric outfits, except that they are automatic in stopping only.

"You can afford a water system because it is complete, no extras to buy, extremely simple to instal. We can make the necessary pipe connections in a short time, and beyond an occasional inspection, and a little oil twice a year, requires no care whatever.

"Your knowledge of farm machinery will tell you at a glance that this equipment has no complicated parts to get out of order. You can have water in the kitchen, wash house, bath room, toilet, in the yard, barnyard and stables. No buckets to lug, or sprinkling cans to carry—no pump handle to tire you out. You know the necessity of water; now think of having it where you want it, when you want it, at the turn of a faucet."

Two Lines Illustrated

Flanking this general sales talk which ran down the centre of the advertisement in good sized type, were two panels, each describing a water system

handled by the firm, one for a water service where the vertical lift is less than twenty-two feet, the other a deep well system. Both systems were illustrated by cuts.

Across the bottom of the advertisement, a general sales talk under the heading of plumbing, carried the following: "Every year our business in this branch shows a big increase. The reason is, we know, because we advance with the times, handle only up-to-date fixtures, installed under the supervision of M. R. Doyle, who will be pleased to give you advice or estimates free of charge.

"We judge our success not by the amount of business we do, but by the number of friends we make. We are not so much interested in a single sale as we are in making a permanent friend of every customer. We solicit your enquiries, no matter how small your job. We will give it our best attention. Out-of-town customers, use your phone at our expense."

Frequent use of advertisements along these lines have given the firm of John Lewis Co. Ltd., a standing in the district, so that whenever a man considers purchasing a water system, whether he has been directly canvassed by Mr. Doyle or not, he immediately calls to mind the fact that the Lewis firm specializes in this line and should be the people to deal with. So he goes there.

For the Early Fall Advertisements

More pressure— more fuel!

It takes greater pressure and more coal to force circulation in radiators from which air cannot escape. Good air valves mean prompt circulation and prompt heating.

More comfort and much less fuel needed, after a very modest investment.

Ask for detailed information and prices.

How to Order Advertising Material

Advertisements in each issue will form a complete month to month advertising campaign for your use.

These are only a few of the electros available in this service. Complete catalog of all illustrations available to date will be mailed on request.

The catalog gives serial numbers on each illustration and the price is quoted. Prices range from 30 cents to \$1.00 for electros according to size.

In ordering from catalog write plainly the serial number of the illustration and send remittance to cover the order in order to save cost by avoiding book-keeping expense.

Extension Bureau*

Comfort for Housewives

Most housewives have plenty to do without "firing up" or regulating dampers several times a day.

An automatic heat regulator makes this frequent attention unnecessary—and saves fuel by preventing over-heating or chilling of the house and still provide plenty of hot water.

The comfort and health protection they afford makes their installation a practical economy.

Heat Regulation is Featured Early in the Fall Window Display

Two Novel Displays Featuring Heat Regulation Systems Which Should be Installed Now, and Sanitary Plumbing for the Kitchen

Window Display No. 121

THE public is always looking for some way in which they can economize on the fuel bill. Window display No. 121 is a good way to impress the value of heat regulation upon the public mind.

For the background, use strips of orange and black crepe paper about two inches wide twisted and hung as seen in photograph. The large Thermostat is made of wall board; shaped and painted to represent the make of Thermostat you handle. An eighteen-inch Scotch gauge-glass, one-half inch in diameter, is used to represent the glass in the thermometer. Purchase a hollow rubber ball about two inches in diameter and four feet of rubber hose. Cut a hole in the rubber ball to fit over lower end of glass tube. Now connect one end of hose to glass by running same through back of Thermostat, up through the rubber ball and into glass tube. Be sure that the tube fits the glass snug enough to prevent liquid from leaking out.

Place three pedestals as shown in photograph; drape some sort of yellow cloth over same. Now place Thermostat securely fastened on centre pedestal as pictured. Place an oscillating electric fan directly in back of Thermostat, on floor

of window so that it will be out of sight from the street. Attach loose end of hose to a cord, passed through a small pulley fastened to top of rear side of Thermostat; and down to another pulley fastened to the Thermostat at the same height as the guard of electric fan. Now attach the loose end of the cord to the guard of fan.

Pour bright red liquid of some sort, into hose connected with glass so that it will stand at 70 degrees on thermometer scale. When the fan is in motion, it will raise and lower the loose end of hose, thereby causing the liquid to rise and fall in glass, suggesting rise and fall of temperature. When the hose and fan are properly placed and adjusted the liquid should not rise above 70 degrees nor fall very far below 60 degrees. On each small pedestal place a Thermostat. Other heat regulating or controlling devices, air valves, etc., could also be shown, in connection with appropriate cards.

The cards in this window read as follows: "AUTOMATIC HEAT REGULATION SAVES FUEL BOTH DAY AND NIGHT." The two small ones read, "BELOW 60 DEGREES WHILE ASLEEP." "70 DEGREES DURING WAKING HOURS."

Window Display No. 122

Material for this type of display can be secured by looking through the copies of almost any month's issue of the nationally circulated magazines. Clip all ads in which modern plumbing or heating fixtures are pictured or described. Arrange them on the glass of your window as suggested in this display, after marking them with crayon pencil as shown. Place a modern kitchen sink, or any other fixtures you may wish to show, in window, as pictured in photograph, with all trimmings thereon, just as though it was actually installed.

Now, use two blackened Kewpie dolls and a box of Gold Dust to represent the advertisement you have often seen of "Let the Gold Dust Twins do your work." Arrange orange and black crepe paper around back and sides of the display to the front of the window, as shown in photograph; and the display is complete.

The card reads thus—Modern Sanitary Plumbing Completes The Comfort Convenience And Modern Refinement Shown in These Advertisements.

John Dykes, plumber and steamfitter, has opened a shop at the corner of Lock and Cedar Sts., at Dunnville, Ont.

Tinsmithing and Sheet Metal Work

Making a Success of the Sheet Metal Art

To Be Successful Sheet Metal Artist You Must
Know the Organized Facts About Your Business
—This is Why Sheet Metal Art is Far Above
Tinning

By J. C. GREENBERG

RELIABILITY is the cornerstone of human character. One must be reliable to succeed. No matter how much intellect you may have, how much knowledge of your work you may have, how much money you may have—if you are not reliable—you are a gifted crook.

Keep Your Promises

If you make a promise to anybody keep that promise. A bad job to a customer is a broken promise. A bad job is bad conduct, and bad conduct cannot inspire confidence. There are three things which enter into the field of successful business; they are quantity of work—quality of work and right mode of conduct. When these three elements are present, you need have no fear of competition whatever. These three elements constitute the principle of perfect service, and no one can ask for more—because there is no more to give.

When you give the right quantity of work—the right quality of work, and right mode of conduct, you have fulfilled your obligation with God and man.

Gives Clever Definition of Competition

What is competition? Some of you will say that competition is price. It is no such a thing. Competition is a battle of facts. If your competitor has a better stock of facts he is in a position to hold the customer's attention longer. He can interest him better—because he has more trumps in his business proposition than you have. That is all. The business man who runs out of facts must as a matter of self preservation attack the figures of his competitor. His ignorance of his business has caused him to resort to underbidding because he has no other defense to offer. The poor boob must pay for his lack of knowledge with his profits. What else can he do? The underbidder is an animal who seeks to rob the customer of good service, or rob the house he deals with of the amount of his indebtedness. He has no other alternative, because if he does work without profit he has no money left to pay bills. Non-payment of bills is unreliability, and unreliability is failure. There are no two ways about it.

Of course he may pay his bills—but he will starve to death. Either way you look at it, it spells failure.

Always remember this—the underbidder is always an ignorant business man and ignorance is weakness. Never fear a weakling, rather pity him. All you have to do is to get facts—use them—and success is yours. There is dignity in pride. There is dignity in good work. There is satisfaction in success. Success is impossible without profit.

When then is profit? Profit is the excess of money over the cost of production and selling—providing the difference is worth it to your customer. Just stop and think over this last.

Art is the skillful application of science, and science is organized facts in any endeavor. Therefore, to be a sheet metal artist you must know the organized facts about your business. The more you know and practice the better an artist you are. This is why sheet metal art is far above tinning. Or in other words, the tinner is not an artist.

You Are Working for the Public

Suppose I were to ask you "Whom are you working for?" you would promptly say that you are working for yourself. That you are a "boss tinner," because you employ men. Wrong again! You are not working for yourself. You are working for the public. The public is your boss. It can make you or break you—it depends on what kind of service you render. Yes, gentlemen, the public is the judge and jury as far as you are concerned as a business man. The public is your boss just the same as you are the boss of your men. If a journeyman falls down on his job—you fire him—and likewise if you fall down on the job with the public—the public fires you, and good night business.

The great question then is, how can we as business men please the public? The answer depends on yourself. You will get out of the public—just what you give it—not more and no less. This is the natural law of compensation.

We All Want Success

All human beings are very different from one another as a class. Every man has different ideas, different opinions, different judgments, different politics and different kinds of religions. But only in one respect are we all alike. There is only one thing in which we all tally—that is—we all want to succeed.

Everybody wants success, because success is the realization of the worthy ideal we cherish. In order to succeed we must serve right. He who serves best profits most.

Failure is Success Gone Wrong

Now then, since we are all alike in this one respect we can all adopt the same medicine as a cure. Failure is success gone wrong. Do you get that? To kill failure is to be successful. If a business man wants to succeed, he must establish confidence. Confidence is the bed rock of successful business—now listen well—confidence can only be established by knowing facts concerning your business. Remember, I said a few minutes ago that you must know all the organized facts about your business in order to succeed. When you tell a customer the truth, and show him undisputable facts he has a confidence in you, because the truth is undisputable. No man ever lived who could turn the truth into a lie.

Confidence Implies Reliability

The efficient man is he who does the right thing at the right time in the right way in the right place and in the right spirit. This is reliability, and unless you are reliable you are soon to give in to failure, because you cannot establish confidence without reliability.

I have mentioned organized facts several times, but did not say how these facts are attained. Where do we get facts? There are catalogs, trade papers, public libraries, salesmen, and best of all, association. Each of these avenues is valuable to the extreme. Do you use these avenues of knowledge in your business? Now be careful what you say—I have seen hundreds of sheet metal men who never open up a trade journal to see what it contains. I know many sheet metal men who do not know beans about the latest things in the trade journals.

They tell me that they have no time to read. Good lord—these men try to make me believe that they have no time to know their business, and to improve their service. Can you beat such a foolish road to business suicide? Just imagine the sadness of it all. The mail man brings these good things to his door, and they rot in their envelopes. No wonder some sheet metal men are failures, they turn down organized facts.

Reputation Grows With Knowledge

The sooner they wake up to the fact that knowledge is power, the sooner will they get out of the tea kettle and wash boiler line, and get real profitable work. The customers will not have the nerve to ask you to fix a ten-cent leak, because your reputation has grown with your knowledge.

Patterns for Knee Protector

Written for Sanitary Engineer by O. W. KOTHE, Principal St. Louis Technical Institute

A SUBSCRIBER wishes a layout according to sketches, of a safety device, and so I am enclosing the layout.

The hood can be developed by the parallel line method. So draw the side elevation to suit the measurements, as A-B as the height, with the angle line A-C, and the top line as C-D-F.

Now the angle C-D-F is bisected in point E which gives a true miter line, or a miter with equal bevels on each side.

Next describe the end view and divide in equal spaces as from 1 to 5, while 5-6 is a straight side and is left that way. From these points project lines to slope line A-C.

Then from these points continue the lines parallel with C-D and intersect miter D-E. After this again follow up your lines parallel to D-F until they reach the base line A-F.

Now by reason of changing the angle of the lines at A-C, which in this case crowds them together, we must develop a modified section through the line 1-6, which is drawn exactly square to C-D.

With dividers pick the half diameters from end view as lines 2-3-4-5-6 and set as 2-2'; 3-3'; 4-4'; 5-5'; 6-6'; which permits you to trace the shaded outline of modified detail.

Observe that, owing to the slant, point E is projected as E' in order to establish that point. This modified detail is the

truth girth outline for both gores M and N of elevation.

To set out the patterns, extend 1-6 as 1'-6', and then from E square a line at right angles to D-F as 1"-E". With dividers pick the girth from modified details as 1-2'-3'-4'-5'-E'-6' and set on these lines just drawn.

Draw stretchout lines, and project lines from each point in miter lines A-C and D-E, and E-F, until these lines intersect similar lines in stretchout.

Through these points sketch a uniform curve and you have patterns M" and N" finished. Laps for seaming must be allowed extra.

The correspondent has also a plan of bottom, but this will work itself out and will be of the same width as end view. At the finish F an oval shape will be developed when rolled up; but this cannot be helped owing to the miter cut F-E.

If the space E-F must be a semi-circle, then this piece N must be developed by triangulation, so the base will be built to the semi-circle.

HAMILTON PROPOSAL SHELVED

Hamilton, Ont.—The sewage disposal question appears shelved for the year, according to officials at the city hall. The matter has not been discussed for some time, the understanding being that at the first of the year a by-law

for at least a part of the work was to be submitted. It is prophesied now, however, that the question is to be laid aside indefinitely.

WESTERN ONTARIO NEWS

Bennett & Wright, Toronto, have contract for new steam heating system at the Mount Hope Orphanage, London, Ont.

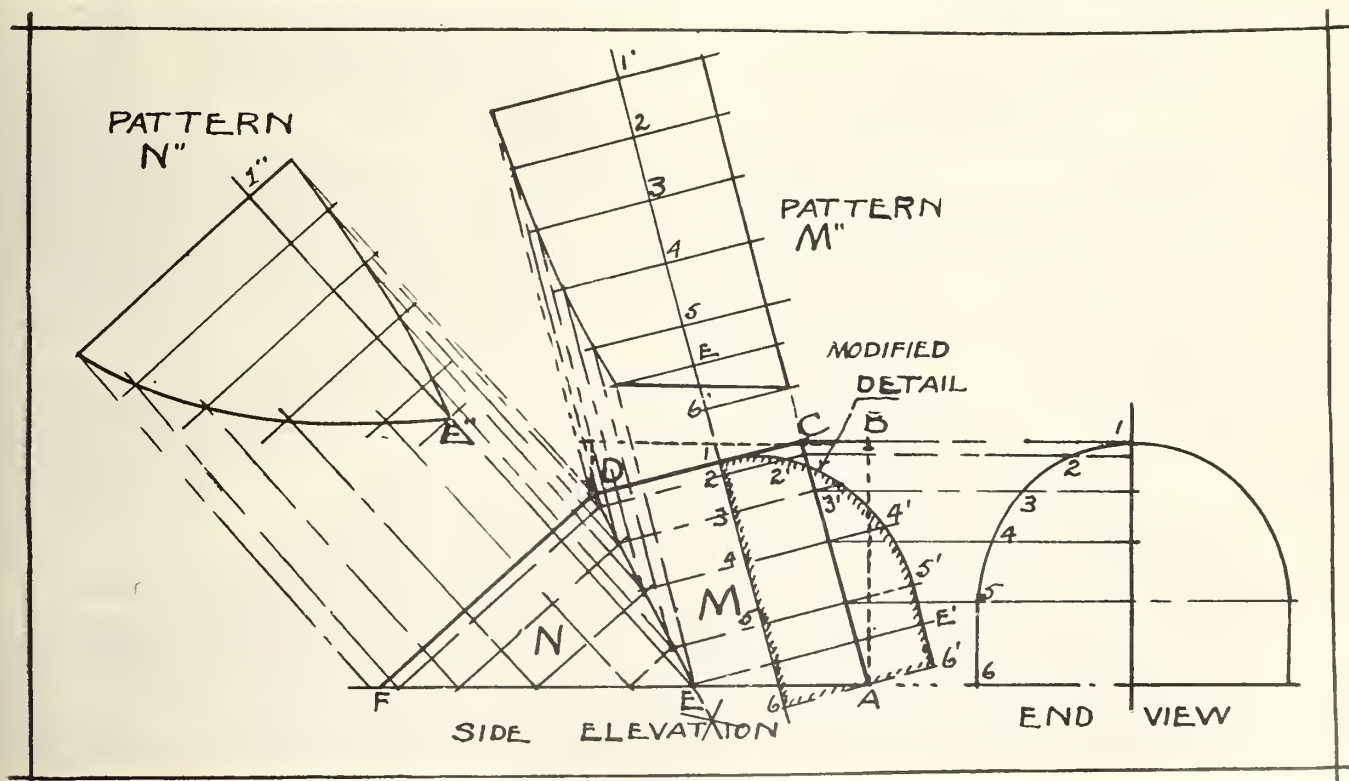

Eggett & Co., London, Ont., have been awarded plumbing contract in connection with new \$100,000 factory being built for Reid Bros., stationers.

A. Skelly, 242 King St., London, Ont., has been awarded plumbing contract in connection with new \$75,000 apartment building being erected by John Hayman & Sons.

The council at Port Colborne, Ont., is having plans prepared for the installation of a waterworks system, and prices will be wanted shortly on mains and equipment.

Tenders will be called shortly for new eight-roomed school at Port Burwell, Ont., and prices will be wanted on steam heating, plumbing, and ventilating equipment. W. G. Murray, Dominion Savings Bldg., London, Ont., is architect.

Bennett & Wright, Toronto, have been awarded contract for new \$40,000 central heating plant for John Hayman & Sons, London, Ont. Work includes a tunnel under street, and plant will heat group of apartment buildings.

Patterns for Knee Protector.

Heating and Ventilating Department

Method of Heating a Huge Canadian Arena With Oil Instead of Coal As Fuel

A Timely Description of the Problems Peculiar to the Heating of the Huge Arena and Its Annexes at the Canadian National Exhibition

By MELVERN F. THOMAS, M.M.E., Consulting Engineer, 229 College St., Toronto.

THE building known as the Coliseum at the Canadian National Exhibition, is 600 feet by 390 feet wide, consisting of a centre section called the Arena, 240 feet by 390 feet, and 54 feet in height on the inside, and the east and west annex buildings, each 180 feet by 338 feet, two stories in height.

The structure is symmetrical about its two main axes, and four towers rising to a height of over 100 feet form the corners of the Arena or centre section.

The walls are constructed of brick, the ground floor of concrete laid on the earth, the terraces for the seats in the Arena and the upper promenade at the rear of reinforced concrete. The second floors of the annex buildings, and the

entire roof, are constructed of wood supported upon a steel frame.

Figure 1 shows the south front of the Arena and a portion of the annex buildings, and the north elevation has a similar appearance.

Used Throughout Year

The Coliseum is one of the group of buildings in Exhibition Park. It is used throughout the year for many purposes, unlike many of the other buildings which are seldom used except during the Canadian National Exhibition.

In the west annex there is a large, completely equipped kitchen, with dining and lunch rooms, which can be put into service quickly to supply meals to meet any demand.

The large floor areas in the annexes

are used each year during Exhibition to house domestic equipment and during the Royal Winter Fair the west section is utilized for similar purposes and for the display of food products, while the east section houses exhibits of birds, fowls, small farm animals and cattle.

Last winter, these sections of the buildings were used for a furniture exhibit, extending over a period of two weeks.

Space for 7,800 Chairs

The arena has an oval, 100 feet wide by 230 feet long, floored with cinders and covered with tan bark. Surrounding this oval, there is a concrete promenade, 12 ft. wide, from which the reinforced concrete terraces rise and furnish space for 7,800 chairs. This section of the building is shown in Figure 2, and has

Interior view of Arena Coliseum, Canadian National Exhibition, Toronto.

Fig. 5—Details of pipe-radiator on terrace and main control points in steam piping.

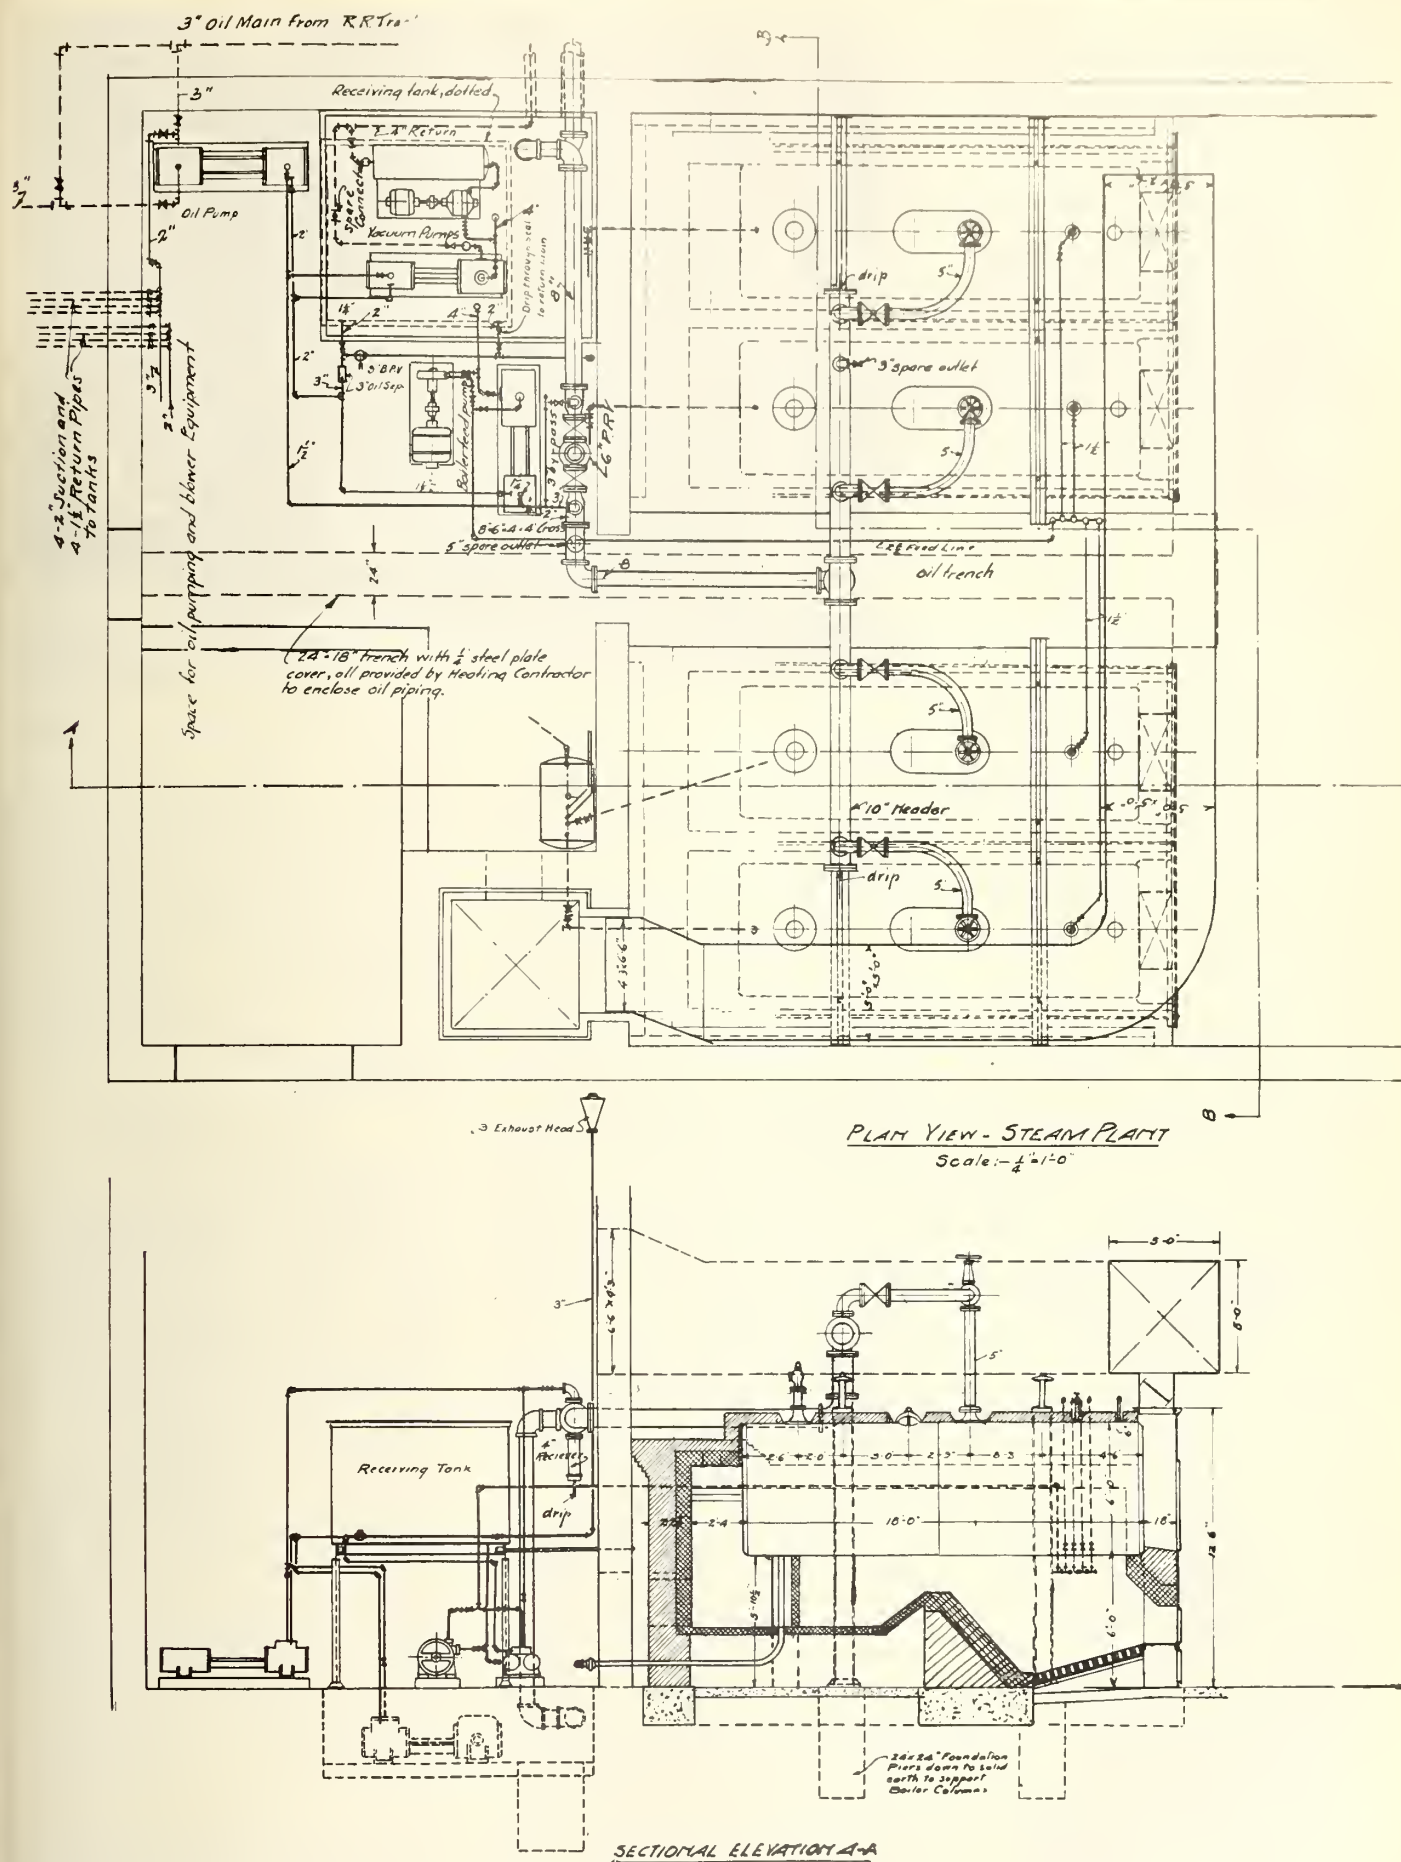

Fig. 5—Plan and section showing arrangement of equipment

radiation at the foot of the terraces and on the high level at the rear of the seats. There are four mains, each supplying one quarter of the Arena section, and these are controlled by valves which can be conveniently operated by chains from the ground floor level.

During evening performances, when the house is crowded, it is found desirable to anticipate the possible over-heating, and cut off practically all of the radiation immediately after the audience has assembled and then to gradually turn on the necessary heat to keep the building from becoming chilly.

The heating in the Arena could probably have been controlled by automatic thermostats, if funds had been available for a complete installation, although it would have been found difficult to locate the thermostats so as to control the different sections of the building at the proper time to prevent draughts or over-heating.

Steam Plant

A brick power house building, 46 ft. by 64 ft., with brick chimney, is located 20 feet from the east corner of the Coliseum. This building has a boiler room, pump room, and in addition, a room for housing the electric transformers for this section of the park.

The following steam generating and auxiliary equipment was installed:

Four 72 in. by 18 ft. H.R.T. boilers, constructed for 125 lbs. working steam pressure.

Four sets oil burners and furnaces.

One 5 ft. by 5 ft. smoke breaching, constructed of No. 10 gauge steel.

One 7 in. by 4½ in. by 8 in. duplex heavy duty boiler feed pump.

One "Westco" boiler feed pump, direct connected to a 10-horse power electric motor.

This pump has a capacity of 40 Imperial gallons of water per minute against 150 lbs. pressure, and is controlled by a push button operated contactor.

One 10 in. by 12 in. by 12 in. steam operated vacuum pump.

One 65,000 sq. ft. capacity Jennings electric motor driven vacuum pump.

One 8 in. by 6 in. by 8 in. duplex general service oil pump.

This pump is used to draw oil from the tank cars in cold weather and to transfer oil from one tank to another when desired, and the piping is also arranged so that it can be used to supply the oil burners, should the other units be out of service.

One Albany oil pump with direct-connected motor to supply burners.

One small duplex steam driven oil pump to supply burners.

One Sturtevant positive air blower, operated by motor to supply air under pressure for starting the oil burners when there is no steam pressure.

Partial view of boiler room with Jack Thomas, operating engineer, in foreground

The general arrangement of the equipment is shown on Figure 5, except that the oil pumping and distribution apparatus is not shown.

The plant was designed to allow one reserve boiler, where all the heating system is in operation, and to have duplicate pumping and auxiliary equipment.

Oil as a fuel was selected, because of its convenience, small amount of labor, quick starting and stopping, easy regulation, and convenient storage underground, where it does not detract from the appearance of the park.

Four cylindrical steel tanks, having a total capacity of 48,000 Imperial gallons, were placed underground near the power house and piped so that oil from tank cars on the siding, 300 feet away, flows by gravity to the storage tanks, or if the oil is slow in running in cold weather, the large service pump is used to empty the tank car.

A system of piping from the tanks to the pump room allows oil to be transferred from one tank to another and to be supplied to the burners from any one of the tanks.

Two Cunerty Burners

The oil burning equipment consists of two Cunerty air or steam atomizing burners in each furnace. These burners operate satisfactorily with an air pressure of 3 to 5 lbs. per sq. in., or with low pressure steam. At this plant the air is used as a means of bringing up the steam pressure on one boiler, after which steam at a reduced pressure of 15 lbs. is supplied to the burner and there further throttled to give the desired rate of combustion.

An important feature of the oil burning furnace in this plant is a fire brick grate through which the air to support

combustion is allowed to pass. This, however, is not necessary to prevent smoke, as it was found possible to obtain a perfectly clear flame immediately when starting the burners in a cold furnace. The oil burning equipment has proven satisfactory, and can be easily regulated by using one burner to give less than 25 per cent. of the capacity of the boiler, or by using both burners to exceed the over-load capacity of the boilers and force the water out through the steam piping.

Distribution System

The boilers are operated at 75 to 100 lbs. gauge pressure.

The power house steam piping consists of the ordinary layout of a main header, connected to each boiler with a double system of valves, all of extra heavy material. To the header are connected branches to the various services. There is a small amount of steam distribution to the milk testing building and to four barns. These have separate pressure reducing valves and connections.

The main steam supply for the Arena and annex buildings passes through a primary pressure reducing valve, and is delivered to the mains at a pressure of 5 to 20 lbs., as is necessary to supply the demand.

The pipes pass underground through steel casings covered with concrete, from the power house to the east annex building where they enter a tunnel which extends 496 ft. under the east annex and Arena building.

Branch mains rise from this tunnel and extend to four main distribution points in the east annex and Arena, and from the end of the main a main rises to serve the old heating system in the West Annex. At the distribution points,

secondary pressure reducing valves are installed and the pressure of the steam reduced to 1 to 5 lbs. as is required to supply its demand under any given existing load condition.

The low pressure steam is distributed around the ground floor ceiling, and at each distribution point there are three main valves fitted with sprocket wheels and chains so that they may be conveniently operated from the floor.

The distribution system to the radiation is in accordance with ordinary standard practice for a vacuum heating system, arranged generally so that the condensation will flow in the same direction as the steam to definitely determined drip points.

Each radiator and drip point in the piping is controlled by a thermostatic trap and the drips from the medium and high pressure piping are generally controlled by bucket type traps.

By-Pass Saves Time

It was found that too much time was required to clear the underground main through an ordinary trap when the system was being started up quickly, so to allow the large volume of condensation and air to pass quickly into the return piping, a 2-in. by-pass was provided to be operated by an attendant, who "stands by" until the main is clear, when steam is to be turned on quickly.

Of course, under ordinary conditions, the steam would be turned on to the main slowly, and time allowed for the vacuum pump to clear the system through the drip traps.

Of the radiation return piping, 2,800 ft. is located in tar-coated wood boxes below the concrete floor. All of this piping is supported on rollers, clear of the enclosing boxes, and is extra heavy, genuine wrought iron. The main return pipe is located in the pipe tunnel and passes through a steel-lined pit in the pump room, where it is connected to the vacuum pumps. The vacuum pumps discharge into a large receiving tank located overhead, and from this tank water flows to the boiler feed pumps. When the steam vacuum and boiler feed pumps are in operation, the exhaust steam from them passes through a coil submerged in the receiving tank, where practically all of it is condensed and reclaimed.

The total radiation in the Arena and two annex buildings, is approximately 48,000 sq. ft., to which must be added about 10 per cent. for uncovered and partially covered piping included in the computations as a part of the heating system. In addition to this load, there is about 2,500 sq. ft. of direct radiation in the barns and milk testing building, and during the Royal Winter Fair, there is a heavy load for heating water and for washing stock.

A Rush Job

The writer was instructed on July 14 1922, to prepare plans. Contractors had access to the plans on August 3, 1922,

Fig. 1—Exterior View of Coliseum.

and submitted tenders on Aug. 10. The contract was at once awarded to Purdy-Mansell Ltd., under an agreement that the system should be ready to operate for the Royal Winter Fair on Nov. 22 of the same year.

That the work could be planned and installed, and put into operation within such a brief period of time, was due in large measure to the constant co-operation between the Parks Department, representing the City of Toronto as owners, the contractor, and the engineer.

Canada Produces 88 Per Cent. of World's Asbestos

Canada produces 88 per cent. of the world's supply of asbestos, all from the mines of southern Quebec. Last year

over 160,000 tons of asbestos was sold and shipped. To secure this amount of fibre nearly three million tons of rock were mined. Heretofore practically all the manufacturing of asbestos products has been done outside of Canada. This condition, however, is being largely overcome by the erection of factories in the asbestos districts for weaving and otherwise developing the product. The chief uses of asbestos are in the manufacture of fire-proofing materials, insulation for electrical equipment, and for pipes, furnaces and boilers in heating plants. With the growth of the automobile trade asbestos has found a large use in the making of brake linings. Canada's export trade in asbestos last year amounted to \$621,000, over \$600,000 of which went to the United States.

New Goods of Interest to Plumbers

QUICK OPENING RADIATOR VALVE

The Galt Brass Company Ltd. of Galt, Ontario, have placed on the market a new line of quick opening radiator valves. This valve is made in all sizes ranging from ½ in. to 1¼ in. and can be supplied with or without the union and union elbow.

These valves are claimed by the manufacturers to be accurately and stoutly made of high grade metal and that they carry the same guarantee as other lines of goods made by this firm. They also claim that this new article is well finished and that it is a great improvement over the old styles of valves, in so much as, that it can be turned on or off without giving the handle more than one full turn.

PLUMBING FLOAT WINS PRIZE

St. Catharines, Ont.—Second prize, in a recent holiday parade, was won by Charles H. Hoople, local plumber, whose float was made up so that one side represented a modernly-equipped bathroom and the other side an up-to-date kitchen.

"Digging Their Own Graves"

THE story is told by William J. Woolley, secretary of the National Trade Extension Bureau, of his meeting an old friend at an Eastern hotel. The friend had been sent to that city as a high powered promotion man capable of conducting a four weeks' sales drive for distribution, by a newly organized manufacturing concern. While waiting to give an order for breakfast the salesman pulled a memorandum index from his pocket and showed a list of calls that he had laid out for that day. The list included some rather "hard-boiled" merchants, and, as Mr. Woolley says, it occurred to him that by the time his friend had seen the last man on the list he would feel he had done a real day's work.

Then he ordered his breakfast, consisting of half a grape fruit, oatmeal and cream, griddle cakes and syrup, a small steak, potatoes, rolls and two cups of coffee. He was late for his first appointment, so he half chewed this young Thanksgiving dinner and was gone. That evening Mr. Woolley called at his room and found that the salesman was not feeling well. He had developed a headache during the morning and "knocked off" at three.

"Digging one's grave with his teeth," as Mr. Woolley puts it, is a very dangerous practice with everyone. The subject also suggests the protection of salesmen's health from a sanitary standpoint involving adequate bathing facilities. It indicates plainly the great loss of time and money which is involved for business firms represented by salesmen as well as for the community on which they call, where inadequate sanitary facilities are provided to assist in maintaining their normal standards of health. This is a phase of the question of sanitation which might well be emphasized by sanitary and heating engineers in their promotion work.

* * * *

A Scientific Calling

THE recent action of the National Association of Master Plumbers of the United States in voting to establish scholarships for courses in sanitary engineering at various universities throughout the country is significant of the change which is coming in this industry. Those who attended tell of the thrill which was occasioned among the delegates when it was established that this proposition was about to be put over. In order to fully appreciate what this move means it needs only to look back over the last few years and see what the attitude of the sanitary and heating engineer has been toward the college man.

Most of our present successful operators came up from the ranks and as one college professor put it, they have been

of the type which "have murder in their hearts when they see a college graduate." When the matter was up for discussion at the convention there were rumors that the scheme smacked a little of exclusiveness and might well give way to a more comprehensive plan of wholesale training of young men through apprenticeship schools. It was felt, however, by the more far-seeing delegates, that there was great need for this industry to carry more weight, it being pointed out that during the war when the government was wanting experts to supervise the installation of sanitary equipment in the camps that the plumbers as a representative body were not called in, it being the feeling that the association did not possess the necessary talent within its ranks.

There will be many advantages of having college trained men to whom members will be able to turn for technical information and advice and the establishment of scholarships in plumbing will be a notice to the world that this industry believes in itself as a scientific and technical calling worthy of the ambition of any young man. This should help in giving the industry such a tone that it will attract the desirable type of young man.

* * * *

The Fuel Problem

AT A TIME when thousands of householders are pondering the problem of next winter's fuel supply, the U.S. Department of the Interior calls attention to the results of tests recently made by the Bureau of Mines which demonstrate the high efficiency of by-product coke. Tests conducted by the Bureau with different types of steam boilers suitable for heating 7 or 8-room houses recorded as high efficiencies with by-product coke as with anthracite. The efficiencies obtained with bituminous coal were 8 to 20 per cent. lower than those obtained with coke.

The anthracite used in these tests was a mixture of egg and nut sizes and was considerably cleaner than that ordinarily obtained in the Pittsburgh market. The by-product coke tested at Pittsburgh was of domestic size, made from a mixture of several coals from the Klondike region near that city. The by-product coke tested at Minneapolis was of domestic size and made from eastern coal.

With the same attention to the fire, the Bureau of Mines found that coke gives much more uniform temperature than bituminous coal. In addition, coke is a clean fuel and makes neither smoke nor soot, an advantage difficult to express in exact figures. It is nearly as good a fuel as the domestic sizes of anthracite, and if anthracite is unavailable at reasonable prices a by-product coke makes a good substitute.

Most Prosperous Country

SOMETIMES it requires an outsider to give us the right perspective on the situation, and herein Canada gets a hearty recommendation from Herbert Hoover in a message to exporting manufacturers of the U. S. in which, after warning that the chief talk of fluctuating exchanges, trade barriers, Bolshevism, etc., centres in Europe, he goes on as follows: "Canada should show excellent returns for 1923 as it is probably the most prosperous country in the world. Her exchange handicap has disappeared, and we have even found it necessary to send more than eighteen million dollars in gold across the border, when her funds were at a premium. The speed of Canada's recovery can be judged when it is remembered that on July 31st, 1920, the exchange stood at \$9.28."

How Long Were the Goods in Your Shop ?

Minute Message No. 27

Written for Sanitary Engineer by FRANK STOCKDALE

Profit Figuring Series

Substitute Your Own Figures. The above amounts are from a Store with Two Stock Turns, Other Carrying Costs 4.1%

HERE "All Carrying Costs"—Rent, Interest, Depreciation and other carrying costs—have been brought together in one chart which shows the total carrying cost on any item or line or department—if you know how long you carried the goods in stock.

Notice how near the carrying cost is to the round figure of 2% a month. It is really remarkable how close to 2% is the carrying cost in the average retail shop, no matter what line of merchandise is being handled.

It is not intended, however, that you should take an arbitrary figure like 2% and apply it to your business. The best figures to use in your business are YOUR figures. It is just as easy, and naturally more accurate, to build a chart from the actual figures as shown in your own expense account.

The purpose of these charts is to show a principle of profit analysis which can be applied to any business anywhere and at any time.

Plumbers want to know the profit—net profit—which each line makes or the loss they must meet, as the case may be. These charts point the way to discovery of this vital information.

THINK IT OVER—APPLY IT TO YOUR BUSINESS

News Notes From Coast to Coast

Doings in the Plumbing and Heating Industry

NEW BUSINESS

H. G. Loewen has opened a tinsmithing business at Winkler, Man.

PARTNERSHIP DISSOLVED

Montreal, P. Q.—Announcement is made of the dissolution of partnership in the firm of Leggett and Owen, plumbers.

MOVED TO SWAN RIVER

Durban, Man.—R. S. Riddell, who has conducted a tinsmithing business in this town for some time, has moved his business to Swan River.

SEWER INSPECTOR APPOINTED

Elmira, Ont.—Charles Harman has been appointed sewer inspector, succeeding Simon Moyer, who was unable to continue in that capacity.

CONTRACT AWARDED

Vancouver, B. C.—The contract for installing heating equipment in the new city garage, Union Street, has been awarded by the city council to Barr & Anderson.

MUELLER SALESMEN CONVENE

Sarnia, Ont.—Mueller representatives from all over Canada attended the annual meeting at the Sarnia plant. Apart from the instructive papers and addresses given throughout the week, a thorough course of sales instruction featured the gathering. Entertainment was in charge of the newly-formed athletic association of the plant.

TEMPORARY APPOINTMENT MADE

Medicine Hat, Alta.—Upon recommendation of the Board of Health, the city council has decided to combine the offices of sanitary inspector and plumbing inspector. The temporary appointment of James Henderson to fill the post was made; this to be made permanent when Mr. Henderson has qualified to pass an examination by the Provincial Sanitary Institute.

PLUMBERS HOLD PICNIC

Hamilton, Ont.—The annual outing, held under the auspices of Local No. 67, International Plumbers' and Steamfitters' Union, at Dundas Driving Park, was highly successful. Besides the journeymen and their wives and families, a large number of master plumbers and representatives of the wholesale plumbing houses took part in the affair. The baseball game, played by teams representing the plumbers and steamfitters, ended in a tie.

ACUTE WATER SHORTAGE

Vancouver, B. C.—Water shortage from the prolonged drought is causing hardship in the northern part of the province. At Inverness the supply was entirely exhausted, but tank cars filled with water were promptly shipped in.

CONTRACT IS AWARDED

Kamloops, B. C.—The contract for the extension of the heating system of the Royal Inland Hospital, so as to take in the isolation hospital, has been awarded by the city council to the Kamloops Plumbing & Heating Company, whose tender totalled \$928.

GAS RATE REDUCED

Oshawa, Ont.—Announcement that the gas rates of this town are to be reduced from \$2.15 to \$2.00 per thousand cubic feet has been made by the Hydro Electric Power Commission, with strong probabilities of a further reduction, dependant upon the fuel situation.

LARGER QUARTERS NEEDED

Toronto, Ont.—The Sepco Automatic Electric Heaters Ltd., who have been located at 47 Richmond St., East, Toronto, are moving to 39 Richmond St., East, where they will have the advantage of larger factory and warehouse space and showrooms, made necessary by the increasing business of the firm.

MISTAKEN IDENTITY

Toronto, Ont.—Through an unfortunate circumstance, it was announced in the August 15 issue of Sanitary Engineer that David Wing, who conducts a plumbing establishment at 1133 Dufferin Street, was a Chinaman, this misleading idea being secured from a business card issued in Chinese by Mr. Wing, who does a considerable trade among the Orientals of the city.

WANT INSPECTION BY EXPERT

Toronto, Ont.—After hearing Reeve Jury's evidence regarding faulty plumbing in a number of houses on Bungalow Rd., and Stanhope Ave., York Township, Judge Denton has proposed that an expert plumber be appointed to inspect all houses in question. The plumbers who installed the plumbing; Plumbing Inspector McGowan who approved it, and Superintendent Hughes of the Plumbing Department will accompany the expert on his tour of inspection.

PERSONAL

F. C. Hamilton, manager of the Canadian John Woods Co., Toronto, Ont., who has been confined to his home through illness, is showing a much improved condition.

BARRIE'S WATER SUPPLY TREBLED

Barrie, Ont.—The town's water supply is now 1,269,000 gallons a day or more than treble what it was before the two new wells were drilled, at which time it was about 350,000 gallons a day.

INSTAL VACUUM HEATING SYSTEM

Toronto, Ont.—The Coca-Cola Company's new building in this city will be equipped with a size C Jennings Duplex hytor-vacuum heating pump and a Sims storage heater, through Arthur S. Leitch Co.

PIPE FROM SCOTLAND

Edmonton, Alta.—Construction of the main line from the Viking gas field as well as the distribution lines throughout the city is being rushed ahead, and approximately forty miles have been completed. A large shipment of pipe from Scotland is expected to arrive at Vancouver about August 20, the shipment including thirty-eight miles of pipe, 12-in. and 10½-in. in diameter, which will be used for the main line.

WILL GRANT FRANCHISE

Winnipeg, Man.—After numerous sessions and many hours of discussion on the granting of an electrical heating franchise to B. W. Barker, who plans to erect an electrically-run central heating system for a portion of the city, the City Council has at last reached the point where it has been practically agreed that a franchise of some sort will be granted, although its nature is not yet very definite, numerous clauses of the proposed agreement having being referred back to the solicitor for revision.

WANT JOINT SEWERAGE SYSTEM

Bridgeburg, Ont.—A joint conference of Bridgeburg and Fort Erie councils is to be held to straighten out a tangle that exists in regard to the project, as advanced by the Provincial Board of Health, by which Fort Erie will link up with Bridgeburg's main sewerage system. The original agreement called for a payment of \$800 a year by Fort Erie, this sum being later reduced to \$500 for three years, but the question of cleaning expenses has caused a deadlock. Both municipalities are anxious to go ahead with the project as it will also mean sewerage connection for Amigari, now divided between the two places.

URGE CLOSER CO-OPERATION

(Continued from page 13)

must watch the account for the first few months.

Demonstrations

There is a question as to how large a city should be to warrant demonstration expense, but some of the medium-sized companies seem to have better results with these demonstrations than the larger companies. Some of the smaller companies have had very good results in conducting a public cooking school lasting one or two weeks. Some companies run them under the auspices of their leading newspaper which co-operates with them, giving them considerable publicity, and it does not appear to be as much of an advertising proposition. In conducting such a school, great care must be taken to secure a demonstrator who can talk and retain the interest of her class, as well as understanding her work thoroughly. Chicago is having wonderful success with their department of home economics, but, of course, they go at it on a scale that none of us could afford.

Practically every company can at least afford to have a demonstrator call on every consumer once a year, to see if the appliances are properly adjusted, if they understand thoroughly the use of the ovens, and to give any information re baking and care of range that may be required. It is far better to have a woman for this line of work, for she will be able to obtain information that no man could get. A woman would far sooner deal with a woman when it comes to anything pertaining to cooking. We have this same woman follow up all installations of ranges, to see that the burners are properly adjusted, working satisfactorily, and also to give any information regarding the use of same that may be required.

Special Sales

All successful merchants put on special sales at times to boost their business and even sell goods at cost or less than cost to get people into their stores, but a gas company cannot adopt these principles without causing considerable bad feeling. Methods that are considered very good business when conducted by a retail merchant, are condemned when carried out by a public utility.

The Sales Stimulation Committee of the A. G. A. have during the past year sent out some very good reports, re gas sales promotion and special sales, which are well worth following up. Their report for July and August is an especially good one for it pertains to the elimination of old and obsolete appliances. They recommend an allowance to be made during these two months for old appliances, the amount to be applied toward the purchase of a new and modern one. By doing this you remove an obsolete appliance from your lines which in itself is a very good thing, for the

consumer does not generally blame the appliance when they do not obtain satisfactory results, but condemns the quality of the gas or the gas company's service.

Some companies have stimulated sales during the dull period by giving special prizes with each range or water heater sold. There is a paper to be read at this meeting covering this subject so will not go into details.

Many companies give special easy terms by making the initial payment very small. They contend that it is far better to hold good paper than stock, and it also keeps your organization together and running smoothly.

If we would check up the appliances in use in any city we would find there are considerably more ranges in use than water heaters. This water heater business is what we must bear in mind for it is really the cream of the business. Our investment in mains, services and meters are already made so we do not increase same when adding a water heater to our line.

Let us all make up our minds that wherever there is a gas range, we are going to instal a water heater, instantaneous or storage if we can, but if not, at least a tank water heater which is stepping stone to something better.

**QUITE ENOUGH**

"Pearl swears she's never been kissed by a man," a clerk informed Assistant Manager Statler in the Buffalo Statler.

"Isn't that enough to make any girl swear?" was his comment.—S. E.

SUPERIOR

He—"Why do you consider women superior to men in intelligence?"

Her—"A bald-headed man buys hair restorer by the quart, doesn't he?"

He—"Er—yes."

Her—"Well a woman doesn't waste time on hair restorer; she buys hair."—S. E.

Following items are reproduced from the MacLean Publishing Co. trade newspaper files of August, 1903:

"H. J. Boyce, plumber of London, Ont., has sold out to W. J. Green."

"Mahoney Bros. of Guelph, Ont., report brisk business. The firm are now doing work at the Western and Priory Hotels."

"A. A. McMichael, vice-president the Jas. Robertson Co., Ltd., has very generously donated a cup to be contested for at the Oakville picnic of Toronto and Hamilton operators by the rival baseball teams."

"Bennett & Wright Co., Ltd., are busy doing quite a large job at the Normal School, Toronto. They are also carrying out a large contract for F. Nicholls at Shanty Bay. Other contracts are being completed on Collingwood boats and library building."

"One of the early enthusiastic members of the Master Plumbers' Association was W. J. Burroughes, formerly of Toronto, now of London, Eng. Mr. Burroughes accompanied by his son recently paid a visit to his old Toronto home and dropped in on a lot of his former fellow craftsmen."

"The action of the soil pipe manufacturers in discontinuing the manufacture of light soil pipe is meeting with the hearty approval of the trade. Cities and towns that have adopted by-laws have prohibited the use of light soil pipe, no doubt because of the belief that pipe of that make is unreliable."

"A very large meeting of the Toronto Association took place in their rooms when T. E. Hoar & Co., Toronto Junction, connected themselves with the association. Plans were made for a joint picnic with the Hamilton association at Oakville on August 12. The services of Harry Mahoney, National Vice-president, as umpire, have been secured."

"There is a noticeable fact of a very striking nature, that is the better feeling that prevails among plumbers and steamfitters, the one for the other. But a short time ago one had not to be long in the company of a master plumber before he would hear a bitter remark made by the plumber against his competitor but this appears now to be changed."

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

DURING the past two weeks, many lines of goods have had better sales than were experienced during the early months of the summer. Among other lines, lead and zinc goods, closet combinations, soil pipe and fittings, compression goods and pipe fittings are outstanding in the list of good sales.

Declines this week have occurred in the prices of some lines of laundry tubs, compression goods,

ground keys stops and wastes, and bath cocks and compression stops, in most centres, and in Winnipeg, solid brass bathroom hooks and force cups have taken lower price levels, while tap plugs have been advanced slightly.

Some declines have been made in the scrap materials market prices in Montreal, and in this line the market has been very dull.

Collections show a slight improvement.

Montreal Markets

MONTREAL, August 30.—Prices which have been in effect for some little time back have been maintained almost without exception during the past two weeks. A change of some note is to be found in the scrap metal market where much easier quotations are noticed on several metals, following the trend of the primary markets.

Trading in some lines shows quite a steady improvement, while in other lines dealers report quite a dullness. Fall business is now commencing and dealers generally are looking for a great improvement in all lines.

SOME LINES OF SCRAP

TAKE BIG DECLINE

Montreal

A weakness is noted in practically all lines of scrap material, yellow brass, red brass, light copper, wrought iron, malleable scrap, heavy melting steel, No. 2 busheling boiler plate and No. 1 machinery cast all showing a decline. Rubber, zinc and lead scrap remain firm. Average buying prices of local dealers are as follows:

SCRAP—	
Automobile Tires	0 50
Rubber Shoes	0 02
Yellow brass	0 06½
Red brass	0 08¾
Light brass	0 04½
Scrap zinc	0 05
Lead, heavy	0 05
Lead, tea	0 03
Light copper	0 09½
Heavy copper	0 11¾
Wrought iron, R. Rd. No. 1 per gr. ton	14 00
Malleable scrap (ton)	16 00
Pipe scrap (ton)	8 50
Heavy melting steel	9 50
No. 2 busheling	5 00
Boiler plate	12 00
No. 1 machinery cast	20 00

BAR PRODUCTS SHOW NO

PRICE ALTERATIONS

Montreal.

A steady activity continues in the local bar product market. prices have undergone no price alterations for some time, remaining at the following levels:

IRON AND STEEL—	
Common bar iron, 100 lbs.	3 95
Refined iron	5 45

Irish finish machinery steel	4 60
Mild steel	3 95
Single reeled machinery steel	5 50
Band steel	3 95
Sleighshoe steel	3 95
Tire steel	4 15
Harrow tooth steel	3 80
Toe caulk steel	4 85
Mining tool steel, per lb.	0 19
Black Diamond tool and cast steel, per lb.	0 19

NOTE.—Refined iron is approximately \$1.50 per cwt. over base, but fluctuates owing to unsettled market.

Band steel in scroll bundles, 50c per 100 lbs. extra.

Iron and steel 3-16 in. and thinner, 50c per 100 lbs. extra.

LEAD AND ZINC GOODS

SELLING WELL

Montreal

No changes in lead and zinc have been noted for the past two weeks. Sales in this line are reported as being very good. Local prices are as follows:

LEAD AND ZINC PRODUCTS—

Lead pipe, per 100 lbs., up to 2 in.	14 50
Do., 2 in. to 8 in.	15 50
Do., 8 in. and over.	16 50
Lead waste, per 100 lbs.	15 50
Lead wool, lb.	0 13
Lead sheets, 2½ lbs., sq. ft. lb.	0 10½
Lead sheets, 3 to 3½ lbs., sq. ft. lb.	0 10
Do., 4 to 8 lbs., sq. ft. lb.	0 09½
Cut sheets, ¾ c. lb. extra and cut sheets to size 1 c. lb. extra.	
Solder, wiping, lb.	0 24½
Solder, commercial, lb.	0 25
Solder, strictly, lb.	0 27
Solder, guaranteed lb.	0 29
Solder wire, lb.	0 39
Zinc sheets, casks	0 11
Do., broken lots	0 12

PRICES REMAIN STEADY IN SHEETS AND PLATES

Montreal.

The price on sheets and plates has remained steady for some time and fail to show any tendency to deviate from the following levels:

BLACK SHEETS—

10 gauge, base	4 75	5 00
12 gauge	4 85	5 00
14 gauge	4 95	5 10
16 gauge	5 05	5 15
18-20 gauge	5 20	5 25
22-24 gauge	5 20	5 35
26 gauge	5 25	5 40
28 gauge	5 35	5 60

GALVANIZED SHEETS—

	Queen's Head	Fleur de Lis
18-20 gauge	6 90 7 40	6 65 7 15
22 gauge	7 15 7 65	6 90 7 40
24 gauge	7 25 7 75	7 00 7 50
26 gauge	7 50 8 00	7 25 7 75
28 gauge	7 75 8 25	7 50 8 00

Other Brands—

10½ oz.	7 75	8 00
28 U. S. gauge	7 00	7 75
28 U. S. gauge	7 50	7 75
24-22 gauge	6 85	7 10
20-18 gauge	6 65	6 75
16 gauge	6 50	6 75

Above prices are for ½ ton lots in English iron and 1000 lb. lots in American iron with a extra charge of 25c for less quantities. Extra for sheets 3 ft. wide, 28 gauge and 10½ oz. 25c per 100 lbs.

Further extra for sheets 4 ft. wide according to gauge.

TIN PLATE—

20 x 28 x 100 lbs. basis.	15 50
20 x 28 IC, 112s	16 00
20 x 28 IX, 112s	18 00
20 x 28 IXX, 56s	11 00
20 x 28 IXXX, 56s	12 00

TERNE PLATE—

20 x 28 IC, 112s, 200 lbs.	14 50
20 x 28 IC, 112s, 214 lbs.	15 00

CANADA PLATE—

Half bright, 60s	5 60
Half bright, 52s	5 50
Blued 52s	5 90
Blued 60s	6 00

METAL LATH SELLING

IN GOOD QUANTITIES

Montreal.

Good seasonable business in metal lath is reported by dealers locally, prices remain firm and fail to show any tendency to deviate from the following:

METAL LATH—		per sq. yd.
Painted—		
26 gauge		23c.
24 gauge		28c.
32 gauge		32c.
Galvanized, 5c. per sq. yd. extra.		

EAVESTROUGH AND CONDUCTOR PIPE REMAIN STEADY

Montreal.

Sales in eavestrough and conductor pipe are reported to be quite seasonable, prices remain steady and are quoted locally as follows:

EAVESTROUGH—

O. G. round and half round, per 100 ft. 8 in., \$16.90; 10 in., \$18.70; 12 in., \$22.20; 15 in., \$35.50; 18 in., \$45.00.

O. G. Square bead, per 100 ft.; 8 in., \$15.90; 10 in., \$17.70; 12 in., \$21.20; 15 in., \$34.50; 18 in., \$44.00.

Discount 65 and 5 per cent.

CONDUCTOR PIPE—Round, Plain and Corrugated, per 100 ft.; 2 in., \$18.40; 3 in., \$22.30; 4 in., \$29.60; 5 in., \$48.00; 6 in., \$58.80.

Discount 65 and 5 per cent.

CONDUCTOR ELBOWS—

Plain or corrugated, price per doz. 2 in., \$5.25; 3 in., \$6.00; 4 in., \$10.50; 5 in., \$24.00; 6 in., \$29.00.

Discount 50 and 10 per cent.

WROUGHT PIPE PRICES

REMAIN STEADY

Montreal.

The price on lapweld and buttweild pipe remains steady. Sales in this line are reported as being quite seasonable and prices are still based on list No. 59 issued some time ago.

WROUGHT PIPE

Price List No. 59. April 24th, 1923.

Discount Standard. 35 per cent.; Extra heavy, 25 per cent.

STEADY TONE IN

INGOT METAL MARKET

Montreal.

The metal market shows very little change this week and considering everything must be said to have held fairly well. Taking into consideration the unsettled conditions prevailing generally, the steady tone is significant as show-

ing the present reasonable level of prices.

LEAD.—This metal is dull and is practically unchanged from last week, with supply and demand fairly well balanced. The next move is not easy to foresee, but is not likely to be very pronounced in either direction. The local market is quiet at 8c per pound.

SPELTER.—London remains firm and East St. Louis is steady at \$6.45. Future deliveries are quoted at a premium, and with the present cost of ore there is no profit for smelters. Any volume of buying would undoubtedly result in higher prices. The local market is firm at 9½ cents per pound.

ANTIMONY.—The tone of the China market is strong, but buying has slack-

ened owing to realizing by second hands. The local market is firm, with English quoted at 8½ cents and Chinese at 8 cents per pound.

TIN.—Considering the July statistics which showed a decrease in the visible supply, the market did not respond quite as anticipated, but is slightly higher than last week. A quiet market will probably be seen until the political situation is cleared up to some extent. The market is steady at 45 cents per pound.

COPPER.—The New York market continues easier without any pronounced selling pressure. London holds very well and this metal would probably respond to any favorable use. The local market is quiet at 20 cents for electro and 19½ cents for casting.

Toronto Markets

TORONTO, August 30.—Local dealers and jobbers report an improvement in business as taking place during the past two weeks and a general spirit of optimism exists in the trade as regards fall business. Price changes which have taken place since last issue, locally, are all in a downward direction. Declines in prices have occurred on some lines of laundry tubs, compression goods, ground key stops and wastes, and bath cocks and compression stops.

Scrap prices are unchanged, and this market is still very dull.

Collections are reported by some dealers to be slightly improved over the average of previous weeks of this summer.

GROUND KEY STOPS AND WASTES ARE REDUCED

Toronto.

A reduction of approximately ten per cent. has been made in the prices of some lines of ground key stops and stop wastes. The new prices are as given herewith:

GROUND KEY STOPS AND STOP WASTES—

Nos. 3954-3969	56% Off
Nos. 4031-4036	45% Off

4208 P. O. basin plug with N. P. tail 1¼ inch	71c.
1 inch x 1¼ in.	33% Off
4216 C.O. basin plug with N. P. tail, 1¼ inch	65c. each
4217 P.O. basin plug with N.P. tail, 1¼ inch	71c each
4248-4251 up to 2 in. yellow metal 50 per cent. off.	
4248-4251, 2½ in. and larger, 50 per cent. off.	

LAUNDRY TUBS TAKE SLIGHT DECLINE

Toronto.

Aristocrat laundry tubs, which have been selling for \$12.50 each, are now being sold at \$12 each. Fair sales are reported to have been made in this line, as building is continuing, though not at the same rate as was the case in the spring of this year.

DECLINES HAVE OCCURRED ON SOME LINES OF COMPRESSION GOODS

Toronto.

Declines in prices have been announced on several lines of plumbing supplies such as compression goods stop and waste cocks, ground key stops, etc. The new prices are as follows:

Compression Bibbs No.'s 3001-3041....	48% Off

Basin cocks, plain or indexed pair.....	3 10
Self-closing basin cocks, indexed.....	6 50
Self-closing basin cocks, not indexed....	5 21

STEADY MARKET ON NEARLY ALL INGOT METALS

Toronto.

With the exception of copper, which has been on the slow side during the past two weeks, ingot metals are steady in price with a fairly steady demand for nearly all lines. Current prices are given herewith:

INGOT METALS—

Copper \$18.00 to \$19.00; Tin \$45.00 to \$46.00; Lead \$8.00 to \$8.25; Spelter \$9.00; Antimony, \$8.25 to \$8.50; Aluminum, \$23.00 to 25.00.

RANGE BOILER SALES FAIRLY ACTIVE

Toronto.

Sales of range boilers are fair and unchanged in price this week. Buildings, which are in progress at the present time, are expected to keep a steady sale in boilers during the fall months.

Perfection

Automatic Air Valves

You might as well try to operate a steam engine without a boiler as to expect the peak of efficiency from heating systems equipped with impractical air valves.

Perfection Automatic Air Valves were designed to give the acme of satisfactory performance—every installation proves that their design is right.

No matter the peculiarities of your system, there is a "Perfection" that will meet them exactly.

Let us give you the facts concerning the full line.

Less 30 per cent.			

BRISK TRADE IN SOLDER AND ZINC GOODS

Toronto.

Sales during the past week in solder and zinc goods have been of good volume. Prices are unchanged with the exception of about a half cent per pound

Reduction in Finished Copper and Brass

FOR some five months now, producers have been looking for another buying movement, but to date none has materialized, and whether the upturn in the London, Eng., market will influence sentiment to the point of wholesale buying at this time is a matter of conjecture.

Sales of electrolytic copper are being effected at both 14 and 14½¢ per pound, delivered, on moderate buying from consumers both in the United States and abroad. England and France have been leading in the buying during the last few days.

The finished brass and copper market has been very soft and easy during the

last day or two, and this market is still in the same state at present.

As a result of the quiet market, one of the largest manufacturers in these lines of goods has declared a sweeping reduction of a half a cent per pound on finished copper and brass products, this reduction to become effective at once.

This change will no doubt affect prices in Canada in the near future, but this change has nothing to do with the reduction in brass plumbing goods, such as bibbs, etc., which is announced this week in Canadian markets, as this reduction in prices has been contemplated in Canada on these lines of goods for some time.

reduction on one or two lines. Prices are given herewith:

LEAD AND ZINC GOODS—

Lead pipe, per 100 lbs., up to 2"	14 50
Do., 2" to 8"	15 50
Do., 8" and over	16 50

A CRANE PRESSURE REGULATOR WHICH TRANSFORMS HIGHER PRESSURES TO ANY CONSTANT PRESSURE

INCREASING THE UTILITY OF A PLANT

Low pressure steam or air delivery direct from higher pressure mains and constant pressure delivery are possible with Crane pressure regulators. Steam at the correct pressure for small power units or low pressure heating, constant pressure steam for process heating and air for blasts, heaters, and low pressure tools can be taken from higher pressure

mains through this automatic valve without loss of one bit of heat or energy. Crane pressure regulators are furnished with unions or flanged connections, for any reasonable capacity and working pressure. Let the Crane representative help you to increase the utility of your distribution piping with this dependable money-saving specialty.

3½ inch	39 50	35 50
4 inch	50 00	45 00

Prices, per 100 ft., f.o.b. Montreal.

Winnipeg, Man.

WINNIPEG, August 30.—There is a seasonable demand for all lines of goods used by the plumbing and steamfitting trades and a revival of business is expected shortly. Tap plugs show a slight advance while force cups and bathroom hooks are quoted at lower figures. Declines in price have also occurred on bath tub brushes. Closet bowls and seats and other closet combinations are showing an improvement in sales of late, prices on these lines are firm and unchanged.

TAP PLUGS AT SLIGHTLY HIGHER LEVELS

Winnipeg.

Higher quotations are in effect on tap plugs, and the following sizes are quoted as listed below:

TAP PLUGS—

Per doz.

¼ inch	2 70
5-16 in.	2 90
¾ in.	3 25
7-16 in.	3 40
½ inch	3 50
9-16 in.	3 75

BATHROOM HOOKS AT LOWER LEVELS

Winnipeg.

Solid brass bathroom hooks are quoted at lower levels, and quotations are \$1.40 per dozen.

FORCE CUPS SHOW A DECLINE

Winnipeg.

A decline is in effect on force cups. Four-inch is quoted at \$7.80 per dozen, four and a half \$9, and five and a half at \$15. Bath tub brushes have also shown a decline, and are quoted at \$5.40 per dozen. Closet brushes are quoted at \$6 per dozen.

EAVESTROUGH AND CONDUCTOR PIPE IN STEADY MARKET

Winnipeg.

Dealers report that the demand for eavestrough and conductor pipe is seasonable and prices are unchanged. The O. G. trough and standard line of conductor pipe sales are well up to the average of last year at this time.

NO CHANGE IN PRICES OF SHEETS AND PLATES

Winnipeg.

No change is noted in the price of sheets and plates. The demand continues fair.

LEAD AND ZINC PRICES FIRM

Winnipeg.

A firm tone is maintained on lead and zinc goods. The demand continues seasonable.

CLOSET COMBINATIONS SHOW IMPROVEMENT IN THE DEMAND

Winnipeg.

Closet bowls, seats, low down tanks, and other closet combinations, are showing an improvement in the demand, and prices are unchanged.

SOIL PIPE AND FITTINGS REMAIN FIRM

Winnipeg.

The demand for soil pipe, especially in the country districts, is showing an im-

provement, and although prices show no change the tendency is that this line will remain firm for some time.

TRADING IN ENAMELLED WARE REPORTED LIGHT

Winnipeg.

Trading in enamelled ware is reported light by dealers locally. No price changes are reported.

NO CHANGE IN PRICE ON CORRUGATED SHEETS

Winnipeg.

Dealers in corrugated sheets report seasonable sales and are looking for an increased demand just as soon as the farmer gets through his threshing.

COPPER AND BRASS PRODUCTS ARE FIRM

Winnipeg.

The market for copper and brass products continues firm, although local prices are unchanged.

QUIET TONE PREVAILING IN RADIATORS AND BOILERS

Winnipeg.

A quiet tone prevails in the radiator goods market, but the trade generally is looking for a revival of trade shortly. Prices in effect are the same as have ruled for some time past.

Twelve Hundred Permits Issued for Residences

THE value of prospective building in fifty-six cities of Canada showed a slight decline during July when, according to reports tabulated by the Dominion Bureau of Statistics, the building permits issued declined to \$12,544,137 from \$14,345,573 in June. In July of last year they had stood at \$15,447,545. Forty-five cities furnished detailed reports showing that they had issued some 1,200 permits for dwellings at an approximate valuation of \$5,300,000, and for nearly 2,000 other buildings estimated to cost over \$6,300,000.

The value of the building permits issued from the beginning of the year to the end of July showed a decline as compared with the corresponding month of 1922, but an increase over the same period of 1921, the figures being \$83,598,348. for 1923, 85,742,989 for 1922 and \$65,451,255 for 1921.

Making Assurance Doubly Sure

No. W-155.
Equipped with motor-driven centrifugal pump.

Write for Catalogue No. 12.

Things once done wrongly are hard to rectify. This especially applies to installations of heating equipments.

Smart-Turner Automatic Feed Pumps and Reservoirs are built to last indefinitely and give constant service to the end.

Their performance in past years is ample evidence of their dependability and sturdiness—meeting the demands placed on them.

Let us consult with you on your heating jobs.

How to Reach Your Prospective Customer as an Invited Guest

II.

Suppose you are anxious to secure an order from an important business man; which of the following would you prefer:

(1) To call upon him at his office, while he is busy with Rush Correspondence or engaged on business with other people with whom he has made appointments, and perhaps find after all he is unable to see you, or

(II) To receive a note from him saying he will be glad to see you if you will call on such and such a day?

Naturally you would prefer to receive his note. You would then be sure of receiving his attention; you would be the "invited guest." In the first case you would be more or less an interloper, possibly unwelcome, as you would be taking up time he had intended to use otherwise.

Now the relative difference between the interloper and the invited guest represents exactly the difference between the free publication or circular and the business paper. The former comes unasked, it may by chance be read, more probably it is not. That depends on circumstances. Its most likely destination is the waste paper basket. The trade paper, on the other hand is the invited guest. It is even more, for it has not only been invited, it has been paid to come. Its arrival is looked forward to periodically and the messages it brings are therefore sure to receive attention.

It is partly in order that he may receive these sales messages that the business man pays for the paper. In most cases the advertisements are considered equally as important as the reading matter. It is advisable then for you to see that your messages reach him in this best of all possible ways—as an invited guest.

Now how can you assure yourself that the medium you choose for your advertisement will comply with these conditions—that it is not among the interloper class?

The answer to this query will appear in our third talk which you will find in our next issue.

Long Service is Assured with JENKINS Radiator Valves

Fig. 490.
Steam Radiator Valve
Angle Screwed.

Fig. 493.
Hot Water Radiator
Valve Screwed.

These Valves are superior to the average Radiator valves.

They are made from a better grade of steam metal and are much heavier and stronger.

Long and satisfactory service is assured where these Jenkins Valves are installed. The Hot Water Radiator Valves open with a quarter turn of wheel. Full opening equals the nominal diameter of the Pipe. A small hole drilled in the plug permits a slight circulation of water through the radiator at all times.

Steam Radiator Valves are equipped with a Genuine Jenkins Composition Disc, easily and inexpensively renewed and, like all genuine Jenkins Valves, can be repacked under full pressure when wide open.

Supplied with Male Union or Screwed Ends and fitted with new Fibre Composition Wheel.

The Banner Way— Economical, Efficient Heating

This is the season of the year when you receive the rush orders for heating appliances.

We are prepared with heavy stocks of both Pipe and Pipeless furnaces and can give first class service.

The Banner Pipeless Furnace fills a useful place and can be installed in an old house or a new one in one day or less and the margin for the installer is good.

The Banner Pipe Furnace is a high grade, efficient furnace at a moderate price.

The Comfort is our new all cast furnace. See our exhibit at Toronto and London Fairs.

Seven Points of "REX" Union Superiority

- 1 "Rex" Unions are tested and guaranteed to stand 250 lbs. working pressure.
- 2 The counterbored ends prevent the first thread becoming battered and permits an easy entrance of the pipe.
- 3 They will not corrode and will withstand vibration, expansion, contraction, fluctuating pressures and other severe conditions.
- 4 The bronze to iron seat, as used in "Rex" Unions, is recognized as the best known combination of metals to be used for permanent joints and where frequent disconnecting is necessary.
- 5 The octagonal shape of the three parts permits of connections being made with an ordinary monkey wrench.
- 6 The uniform diameter of the waterway insures an unobstructed flow and thorough drainage.
- 7 "Rex" Unions can be supplied threaded to either Briggs or Whitworth Standard and can therefore be used for your export trade.

A Proof of "Rex" Union Superiority
Canadian Car & Foundry Company, Limited
Montreal, Que.

FITTINGS, LIMITED, Oshawa, Ont.

Dear Sirs:—Confirming our conversation with regard to Rex Unions; as you are aware, we have recently purchased from your Company a large quantity of Rex Unions, and have found them satisfactory in every respect. They appear to have more metal in them than other Unions, and we also find them interchangeable; in fact we are very well pleased with them and intend specifying your Unions on our orders where we can consistently do so.

Yours very truly,

KERR VALVES

No. 43—Screwed

The illustration here is of our genuine WEBER PATENT Bronze Gate Valve.

All old timers remember it as the best made and best appearing gate made in Canada.

It earned its reputation years ago, and still maintains it. It has stood the test of time.

What better recommendation could one ask for a valve, than to meet all comers for 40 years.

It has had its imitators, but the genuine Kerr Weber Gate leads the procession.

Get out in front and use Kerr's Weber Gates. You will see the difference.

Dodging a Shower

How many of your customers are putting off the purchase of a shower because their water-heating equipment is unreliable?

The Marvel Gas Water Heater provides hot water for a shower or bath in a very few moments and at insignificant cost. The tank is extra heavy; boiler and all water fittings heavily galvanized, so that the Marvel, easy and inexpensive of installation, lasts a lifetime without repairs or replacements.

There is good money in the sale of Marvel Heaters.

AT TORONTO EXHIBITION
August 25th - September 8th

Architects and Heating Contractors will be especially interested in our Exhibit in Machinery Hall, at the Toronto Exhibition.

We invite you to visit us, to examine carefully the important features of the Farrfhern Heating System. We will be delighted to show you how Morehead Back-to-Boiler Systems are saving fuel daily in hundreds of manufacturing plants in Canada.

Ask us any question about Heating Systems. Let our Service Department help you, as we have helped others, to greater industrial economy and higher operating and heating efficiency.

Don't forget the building, Machinery Hall, Canadian National Exhibition. Drop in at our Booth at any time—we'll be glad to see you.

WANT ADS

If you want a buyer, clerk, salesman, traveler, position, you can reach the best men in the trade through these columns.

If you wish to buy or sell a business, or dispose of overstocks, you can reach a larger number of sanitary engineers through this page than in any other way.

Rates (payable in advance) 2 cents per word. An additional charge of 10 cents for each insertion is made when Box Number is required. Each figure counts as one word. When panels are desired a charge of \$2.00 is made for a panel 1 inch deep by 2½ inches wide. Address all advertisements for this section to SANITARY ENGINEER, 143-153 University Avenue, Toronto, Canada.

FOR SALE

Plumbing and heating business for sale. North end Toronto. New six-room house, workshop, and garage. \$1,200.00 cash handles. Apply Box 414, Sanitary Engineer, Toronto.

Active Partner Wanted

In a well established plumbing supply house. Wholesale jobbing trade extending from coast to coast. Extra capital of fifteen thousand dollars required for expansion only. Stock on hand, fully paid \$40,000.00. Business will stand thorough investigation. Box 38, Sanitary Engineer, Toronto.

Dunham High Pressure Bucket Trap—Type No. 80 Quick acting—Powerful—Accessible!

There's nothing "draggy" about the action of this trap. The shape of the Dunham bucket and a short-coupled leverage obtain unusual power and speed. When the bucket is down and the trap is discharging, the inclined bottom stands practically in a horizontal position. As the water is forced out thru the discharge tube from the bucket, and the bucket begins to rise from the buoyancy of the water surrounding it, all of the water on the bucket "shelf" is suddenly poured over into the water seal. As a result the movement of the bucket is greatly accelerated in its closing action.

This is a strong, simply constructed trap for removing condensate from fixtures, steam lines, separators, laundry equipment, heaters, vulcanizers, dry kilns and other industrial apparatus where high pressure steam is used. It is the speediest and most powerful trap of its size and type made. This is due mainly to the shape of the Dunham bucket, as described under illustration.

Another big feature is its accessibility. The cap may be removed without disturbing piping connections. This exposes the double-end valve and reversible valve seat which are made of monel metal. These vital working parts may be quickly reversed or replaced. Compare Type 80 with any other trap for operating efficiency and durability.

Write to us to-day for complete information and price list or Dunham Traps and other heating and industrial specialties.

Prevents Disaster

YOU can't measure the value of a **Safety Relief Valve** until an accident occurs. With it installed in the water heating system, every possibility of boiler explosion through excess pressure is eliminated—without it property damage and loss of life are always possible.

Even though the householder may not realize the significance of ample boiler protection it is your obligation as a heating specialist to point out its importance and install a dependable safety device in every water and closed heating system.

Donnelly Pressure Relief Valves are dependable. They are simple, have no complicated mechanism to get out of order, no interior springs nor weights. Any mechanic may instantly regulate **Donnelly Valves** to operate at any pressure as may be required.

Every valve is thoroughly tested, after assembly is completed and if found unsatisfactory for any reason, replacements will be made free of charge.

Ask your jobber or write us.

And Now "Emco" Perfects a New Steam Radiator Valve

THE new "Emco" Steam radiator valve is built in keeping with the Empire standard of manufacture.

It is of the composition disc type which may be renewed easily. It is not necessary to shut off the pressure when repacking, it may be repacked with the valve wide open. The wheelhandle is baked enamel of the mushroom type.

The "Emco" No. 880 or 881 steam radiator valve is highly nickelled and well proportioned, giving the valve a handsome appearance. This radiator valve was designed to give dependable service, and like all "Emco" products has been fully tested under pressure before leaving the factory.

Into Holes and Corners

THE *Little Giant* goes into the holes and corners to **turn** the pipes and nuts that the conventional wrench cannot even **reach**. This is one important advantage of the *Little Giant's* simplified, end-opening design. Its jaws grip the pipe and let go as quickly as a pair of pliers.

The *Little Giant* has only three parts—drop-forged and carefully heat-treated. Besides making the wrench “handier” and practically indestructible, the absence of springs, frame and other surplus parts gives the *Little Giant* greater strength, though it is lighter and more easily handled.

The reinforced head and extra long handle insure the strength and leverage to easily turn the tightest pipes and nuts.

Long service is assured by the several sets of teeth (two on the smaller sizes and four on the larger ones) that multiply its wearing surfaces.

You can see from the illustration the big advantage of the *Little Giant* design.

Write today for full particulars, and descriptive circular 302E.

Better Better P

The modern bathroom must contain themselves; that embody refinement kept clean and white with the minimum time of the owner. Canadian Solid Ware with all of these requirements.

Of first consideration in every toilet-room is the closet combination, and too great emphasis cannot be placed upon the necessity of using none other than SOLID VITREOUS ware for both closet and tank.

The Quietus Syphon Jet closet with extended front lip as illustrated is the highest development of sanitary science in closet construction. Solid vitreous through and through, it cannot absorb dangerous acids or germs; its smooth surface has no affinity for dirt; its action is quick, strong and positive, yet being made with the wonderful silencing chamber, the sound of its operation cannot be heard outside the toilet-room itself.

The Bellemeade Tank is also SOLID VITREOUS through and through; it has no metal lining to corrode or leak; no joints to split or open up; no paint or enamel to scratch or discolor, no metal to rust nor composition to disintegrate; just burned clay, white, clean, sanitary, everlasting.

It is Easy Carefree, Dependable

With Daisy Boilers

Leading a prospective customer through a maze of technical heating features cools enthusiasm and beclouds the main interest.

Abundant heat — Easy operation — Dependable service — clean cut assurance on these points will make it comparatively easy for you to sell a heating plant.

In selling Daisy Boilers you have not only **your own** confidence and **our** confidence to support your claims; you have the combined commendations of more than 60,000 contented "Daisy" owners to influence the prospective buyer.

Such united opinion is our greatest single asset.

Warden

Montreal

Branch Office

to Sell Heating Service and Viking Radiators

Such testimonials prove that we are selling friends instead of mere customers.

Because homes vary greatly in size, design, and in the matter of exposure to weather, the heating capacity of the boiler must be carefully considered.

We have for 60 years tried to adapt the heating plant to the home—with proven success. You are able, with our co-operation to meet every heating problem with a Daisy boiler of ample rated capacity.

It is easy to sell **CAREFREE, DEPENDABLE HEATING SERVICE** if you sell Daisy Boilers. Combined with Viking Radiators they form the perfect heating system.

You'll Have to Take it to Him

FEW INDEED are the disposal systems sold in a show room.

The men who are making big money to-day in the rural plumbing field are the fellows who get muddy boots and soiled trousers from trailing the farmer across the south pasture to the wood lot and who there, right on the ground, put over their sales story.

Farmers and suburbanites everywhere need sewage disposal systems; they know they need them—but will not come of their own accord to buy them. To help these people to a better standard of living and to make a handsome profit in so doing, is the privilege of the Sanitary Engineer.

To-day, with bitter winter just over the hill, the farmer is more than ordinarily ready to discuss indoor toilets and the value of a supply of hot running water, but he will not come to your show room to discuss these things—you must take your story to him.

Showroom and Display Window Triple the Trade of Toronto Plumber

John W. Oram Finds Lucrative Business in Replacement Work in Large Residences—Most Houses in District Have Four and Five Bathrooms—Sells Gas Ranges and Electric Heaters in Store

"THE plumber who does not believe in the value of the showroom and window display as a business-pulling factor in his establishment has never tried it out," was the comment of John W. Oram, who does a large plumbing, heating and tin-smithing trade from his shop at 836 Yonge Street, Toronto, Ont. "I can say this with assurance, because I have operated both ways and attribute the greater part of my present trade to the fact that I have a well-equipped showroom and a window where I can display my goods so as to attract the attention of those passing along the street.

"When I was located across the street, previous to moving into my present shop about four years ago, I had not the same facilities for display at my disposal. Since moving the plumbing end of my business has practically

tripled in volume, an increase that must be credited almost entirely to my windows and showroom. This is my only form of advertising and I do not go out after business—haven't time to do so, even if I felt inclined to—so there is very little else I can credit with the new business."

There is the fact to be borne in mind, however, that Mr. Oram has been in business in the same locality for a number of years and has gained a reputation for his work that is standing him in good stead now. Located in the heart of the Rosedale district and with in easy access of The Hill district, two of Toronto's more exclusive residential districts, Mr. Oram is admirably situated for the work that is now occupying the greater percentage of his time—that of putting in additional bathrooms and similar equipment in the large residences of the district.

"Most of these houses have four and five bathrooms in them now," stated Mr. Oram. "If they haven't, I'm putting them in. Putting in additional equipment of this nature and doing replacement work is keeping my staff so busy these days that I have no time to devote to new installation work. Several times recently, contractors have come to me to see about having installation work done in houses they are erecting, but I have not even quoted figures on the jobs. The other business is much more satisfactory and keeps my staff well occupied."

Many of the large residences in which Mr. Oram finds the bulk of his trade have bath fixtures which were installed before the art of equipping bathrooms had advanced to its present position. They are not as convenient and have not the artistic appearance of the more modern styles and it is replacing such

Window trims play an important part in the business of John W. Oram, Toronto. The trims are changed regularly, plumbing displays in various arrangements occupying the space most of the time. Seasonable heating trims, like the one illustrated, are used frequently and have been productive of much business.

goods that the showroom and window displays play such an important part.

The show window of the O. am store is changed frequently, displays of complete bathroom sets in different styles being shown regularly. Inside the store, all the latest designs in fixtures are to be found down the right side of the light, well-arranged store, making selections a matter of little difficulty. Light-colored walls and white metallic ceiling add to the general, light, clean appearance of the room, making a visit to the shop a pleasure, while a number of chairs placed at convenient intervals down the length of the store, provide the female visitor with an opportunity of sitting down and making her selection of fixtures at her leisure and with a minimum of exertion, a feature that has been much appreciated.

Having a large store at his disposal, Mr. Oram has been in a position to go after stove business, which has linked up well with his furnace sales and tinsmithing business. A good selection of gas ranges is carried, being shown down the left side of the store, while electric grills, electric and gas water heaters, and a small line of electric utensils are also carried, taking up little space and producing a good profit.

As in the plumbing lines, it has been found to the advantage of the firm to show the heating goods in the win-

Defends Canadian Galvanized Sheets

A. T. Enlow Makes Defence of Canadian Product
—Charge That Galvanizers are Thinning Zinc Coating Does Not Apply Here

A VIGOROUS defence of Canadian made galvanized sheets was made by A. T. Enlow, president and manager of the Dominion Sheet Metal Corporation Ltd., Hamilton, Ont., recently in discussing an editorial appearing in an American publication in which the statement was made: "It has been charged that our galvanizers have thinned the zinc coating so that our galvanized sheets and wire are no longer durable. Also that other foreign sheet galvanizers have been doing the same thinning as American."

"In this connection," says Mr. Enlow, "it is a matter of great pride to us that the Canadian galvanized sheets which have been made here in Hamilton for the past eight years, have always contained a uniformly heavy coating and on that account we have never received a single complaint as to their rusting under ordinary exposure.

"It is, of course, possible to subject galvanized sheets to conditions where coating even though heavy will not protect them permanently, as, for instance, in factories where acid fumes exist, and around coal mines and similar places where free acid is in the air. For ordinary city and especially country use our galvanized sheets have been found very satisfactory and it is largely due to the excess amount of coating which we put on these sheets as compared with the very thin coating of inferior metal as employed by many galvanizers whose sheets are exported to Canada. As compared with Canadian made sheets, we have seen many imported brands which, under ordinary exposure in cities, have shown traces of rust or have turned brown within two or three years from the time of installation, whereas a well-galvanized sheet should last almost as long as the building itself."

dow, displays at seasonable times of the year having proven their value repeatedly. An attractive window trim devoted to cooking and heating equipment, which was shown recently, appears in connection with this article.

Speaking of the sale and installation of furnaces, Mr. Oram stated that here, too, the firm's work was confined principally to large replacement jobs, the work being done principally in resi-

(Continued on next page)

The large, light showroom that forms a necessary part in the business of John W. Oram, Toronto, is credited with bringing in much new business. The size of the room allows ample space to show a number of complete bathroom sets down the right side and gas ranges, gas water heaters and other goods down the left side.

Showing a bathroom, fully equipped, in one show window and a wide range of small bathroom fittings in the other has been found a good combination by one Ontario plumber who is firmly convinced of the sales value of effective window displays in selling his goods.

Suggest Scholarship Plan for Sanitary Engineers

Representative Gathering of Master Plumbers Endorses Scholarship Plan and Campaign of Publicity—Specialized Teacher Training for Instructors

ACTION was taken on two important matters at a recent convention of master plumbers. One was in connection with the apprenticeship problem and the other in connection with the higher education of the "plumbing engineer."

The apprenticeship plan, as finally endorsed, provided:

1. That a man be employed as educational director, at a salary included in the proposed budget, to devote his time to promoting training for the industry.

2. That the national association advocate training for the plumbing trade in part-time and evening vocational schools.

3. That a standard course of study for these schools be adopted only after the Minneapolis course has been tried out and reported upon. It is suggested that the committee be kept in mind when the standard course is formulated. The outline of the standard course should be published in the T. E. B. Bulletin, so that suggestions and criticisms of the members of the trade can be secured. It was recommended that the necessary instruction on gas should be inserted in the standardized course.

4. That instructors in plumbing be sent to some central training point for specialized teacher training, their expenses to be paid by the local associations.

5. That a campaign of publicity be carried on by the educational director.

The estimated cost for the first year comprises a budget of \$12,000, which was approved, and which is divided: Salary of educational director, \$4,000; traveling expenses, \$1,500; rent of office and clerical help, \$2,500; printing, \$2,000; miscellaneous items, \$2,000.

E. L. Bowman will probably be the educational director, and he will take up his duties at the headquarters of the Trade Extension Bureau, Evansville, Ind., about the middle of August.

The movement to provide opportunities for the higher education of the master plumber was warmly advocated in a presentation of the subject by Frank J. Fee. The convention voted to instruct the incoming president to appoint a committee to put the scholarship plan "in effect."

SHOWROOM AND DISPLAY WINDOW

(Continued from previous page)
dences where the firm had handled a similar job in the plumbing line.

Asked what class of heating equipment was being installed, Mr. Oram stated that he was installing hot water systems exclusively, over ninety per cent. of the residences in his district being equipped with this type or ready

to change their old systems for the hot water.

Some idea of the volume of business handled by the firm may be gained from the fact that from twenty to twenty-five men are employed constantly in the various departments. Mr. Oram does much of the outside work of the business himself, estimating on and supervising jobs, the office end of the business being handled by a competent bookkeeper who also assists in the showroom. The large tinsmithshop needed for the amount of business handled is immediately to the rear of the offices, which are located at the back of the store.

DISCONTINUING BUSINESS

Saskatoon, Sask.—It is reported that E. Riley is discontinuing his plumbing business in this city.

LAVATORIES IN GASOLINE STATIONS

Toronto, Ont.—Under new local regulations, all gasoline service stations in the city will be required to furnish lavatory accommodation. Regardless of the \$10,000 cost requirement, the plans for all new service stations will have to be approved by the city architect.

INSTALLING ELECTRICAL BOILERS

Winnipeg, Man.—A number of city firms and institutions are installing electrical boilers, it is stated here. The Northwest Laundry is installing an electrical heating plant of 500 h.p. capacity, while Grace Hospital is figuring on a similar installation of 900 h.p. capacity. Residences too are included in those being fitted for electrical boilers.

Advertisements Tell of Contracts Secured and Reasons for Selection

Large Jobs Won in Competition Make Excellent Boosts in Securing Additional Business—Repair Shop Features One-Trip Service for Complete Jobs—Importance of Good Plumbing for Health and Comfort

IN THE advertising being done by plumbing and heating men of late, the tendency has become more marked to emphasize work that is being done or has been done by the firm, a feature that is particularly good in the instance of firms securing large contracts.

This idea has been carried out in a large advertisement used by J. McIntyre, Whitby, Ont., who, under the heading "McIntyre Scores a Triumph" goes on to tell of securing contracts on continuation schools at Pickering, Brooklin and Claremont. He then continues:

"We believe the awarding of these contracts to us is of great significance to the town of Whitby as well as ourselves. The competition for this work came from such large centres as Toronto, Peterborough, Lindsay, etc., and while our price was, perhaps, not always the lowest, (although due to our geographical position insofar as the three vil-

lages mentioned are concerned, we were in a much better position to offer a better price than outside concerns) we were awarded the contracts.

"We attach further significance to these contracts because in each instance we not only had the different school boards to deal with but the architects also. As it is the duty of the architect to see that a perfect job is turned over to the school board, it is necessary that the contracts be awarded to concerns that are both reliable and capable. We were in the happy position to have many fine jobs to our credit in all these districts and therefore had the advantage of our competitors."

On the Pickering Continuation School this firm was awarded the steam heating contract, on the Brooklin Continuation School the heating, plumbing, ventilating and tinsmithing contracts, and on the Claremont Continuation School the con-

tracts for plumbing, heating, and ventilating.

Equipped Dairy Building

The same idea is carried out in the advertisement of J. A. Langelier, Ottawa, Ont., who announces that "the plumbing in connection with the new Ottawa Dairy Building was installed by us. Our experience in handling large contracts enabled us to meet the requirements in this up-to-date new dairy building with the utmost satisfaction. We can extend the same service to you and guarantee genuine results at a cost that will mean a saving to you."

Cowan's, Brantford, Ont., emphasize the importance of good plumbing to health and comfort, while the Plumbing Repair Shop, Windsor, Ont., point out that the completeness of the service extended by this firm enables them to do the work on one trip, the store's slogan being: "One trip does the job."

The tendency to tell of good-sized jobs secured and handled by the firm is being used effectively in the advertising of many sanitary and heating engineers, several good examples being noted in the accompanying advertisements.

"Things Are Improving—No Longer Morning After Night Before But Getting Toward Dinner Time"

Hon. W. R. Motherwell

Canada Now Largest Exporter of Wheat—Decreasing Death Rate of Children—A Few Inexperienced Farmers Doing All the Talking

PREDICTING the greatest crop in the history of the West, Hon. W. R. Motherwell, Federal Minister of Agriculture, in an address before the Canadian National Newspapers and Periodicals Ass'n stated that there was room for justifiable optimism in connection with the agricultural industries of this country and that much of the talk of low prices and farmers' inability to buy the necessities of life was far from representative of general conditions in the agricultural sections of this country.

Speaking of agricultural problems Mr. Motherwell said: "We never came across a question that was not capable of solution and this one is the same as the others. We know that we are going through a trying period but we know the reasons. We know that we have raised our standards of living and that our present revenue cannot support us. The value of farm products is much less than before the war and we are trying to keep up higher standards on old methods of farming. We can reduce the costs of production but it is hard to do so without reducing the quality. We can reduce the standard of living but we don't want to do that.

"Another way is to improve our methods, improve farming practice and raise the quality of our cattle. We must get more revenue if we are going to meet the expenses of our present standard of living. If we are bound to sport a \$3,000 car we cannot do it on a 3,000 lb. of milk per year cow. A 4,000 lb. milk cow is the average in Canada and it takes that much to keep it. The average cow in Canada only maintains itself. By taking the diversification of activities on Canadian farms, something enables us to make a living but many do not know where it is.

Too Much Exclusive Farming

"Something does pay, but there is too much of a disposition toward exclusive farming, particularly in the West, and too much of a disposition among farmers to plunge into debt. The average difficulties come through going injudiciously into debt. A good doctrine to preach to farmers is 'Pay as far as you go and if you cannot pay, don't go.'

"The farmer must realize that it is better to go steadily up the ladder rung by rung and study the business rather than go too fast and slip, bringing down all the rungs with him. Some farmers are going into business in cities and towns without any experience.

That is the trouble in many western communities. They retire to a village or town and enter business without training and get a big line of credit. Much the same thing applies to farming where many inexperienced hands with inefficient methods are unable to make a living.

"We can increase our revenue by improving our livestock, our methods and by having more production on the basis of quality. The United Kingdom is served by many parts of the world where labor is cheap. We have to come into competition with that labor and we have to adopt their standards or improve our quality. In dairying we have not slipped behind but other countries have gone ahead and we have lost our pre-eminence in the world markets in dairy supplies. But it is significant that last year we sold butter on the British market at much higher prices than our competitors because of the quality standards. If we have quality, farming can be made profitable even in the West where the biggest chances are taken. In that country we should scatter the chances.

Largest Exporter of Wheat

"In the last forty years Canada has sprung up from almost nothing to be the largest exporter of wheat in the world. When we hear blue ruin talk we should think of what we have accomplished. The railways are another criterion of development in Canada. They got a big knock when the war was over due to the high cost of labor and the difficulty of getting increased rates. Even the Canadian National Railways

HON. W. R. MOTHERWELL

which were looked upon as a bankrupt concern a few years ago are now in a much better condition. Their revenues and those of the C.P.R. have greatly increased. The C.N.R. is looked upon as an impossible concern by some, but it is like the babe left on the doorstep and it is a fact that its net revenue has shown a much better position lately than a year ago. Revenue was increased by five million dollars in the first seven months of the year.

"Things are improving. It is no longer the morning after the night before but is getting along nearer dinner time.' The death rate among children under one year in Canada is steadily declining. One of our provinces has the lowest death rate for this class in the world. We have great cause for satisfaction in the improvement of health, and another thing, Canada has never had any such terrible calamity as that which has befallen our Eastern ally, Japan. Such things we are free from. In our forests and mines there is a great revival of activity, so much so that an agitation has sprung up for the protection of pulpwood by our manufacturers who are afraid of depleting our forests. Insects and fire do more than the hand of man to destroy our forests. If we would take care of our forests by preventing fire and insects from destroying trees, reforestation will take care of itself by nature.

Mines

"Regarding our mines, we are very hopeful regarding the future. We have 90 per cent. of the asbestos of the world

(Continued on page 20)

Plumbers Mix Pleasure With Instruction at Interesting Outing

Visit of Over One Hundred Plumbers of Hamilton, With Friends From Toronto, Brantford, St. Catharines, to Welland, as Guests of Page-Hersey Tubes, Ltd., Proves Interesting and Instructive—Many Novelties and a Sumptuous Repast

By Staff Representative

ONE of the most enjoyable and educational outings with which any group of Canadian sanitary and heating engineers have been connected was that held on Tuesday, Sept. 11, when master plumbers of Hamilton, along with visitors from Toronto, Brantford, St. Catharines and other points, journeyed by motor car to Welland, where they were the guests of Page-Hersey Tubes Ltd., to a sumptuous

an organization for the holding of educational and social gatherings. The proceedings of a number of such gatherings held last winter in Hamilton, were outlined fully in Sanitary Engineer and so successful has been the plan that plumbers in other cities are planning to adopt it. H. E. Rooke, Page-Hersey Tubes Ltd., was chief speaker at one of these meetings, and it was as result of favorable impressions carried away from that meeting that he extended the invitation on the part of his firm for the same group of plumbers and their fellow craftsmen to the outing held on Tuesday.

Start the Procession

The procession of motor cars lined up in front of Standard Sanitary Mfg. Co. offices on Jackson St., Hamilton, at 8.30 on Tuesday morning, where cars were numbered and passengers allocated. Living up to their reputation most of the plumbers were there promptly on time and a fairly early start was made. The splendid road and comfortable cars owned by the craftsmen of Hamilton lent every comfort to the drive through the beautiful Niagara peninsula, commonly known as the Garden of Canada. The weather could not have been better. At St. Catharines, the proportions of the procession were increased by the addition of district men and the drive was continued on down to Welland. Headquarters was made at the Hotel Reeta and when this galaxy of cars arrived the city right around the hotel, looked almost as active and prosperous as Hamilton itself. There were a few late arrivals, but they were to be excused because they had come all the way from Toronto, and Major Anthes' deduction that he could make better time by going to Welland around by Niagara Falls, was not borne out. The genial Major was well fitted out for the occasion, however, someone having counted at least five coats which he donned before setting out to brave the return trip. These coats, be it explained, took up the surplus room in the rear seat of the car so as to minimize the amount of side-play.

When the last car had arrived there were over one hundred present. All wore identification tags supplied by

Standard Sanitary Mfg. Co., and distributed to the visitors as they arrived by Messrs. Hagen, Cardwell and other local craftsmen. After a brief visit, dinner was announced and a most complete and enjoyable repast it proved to be. Among those at the head table were H. E. Rooke, Page Hersey Tubes Ltd.; T. Wallace, Major Anthes, Anthes Foundry Co.; E. Holt Gurney, Gurney Foundry Co.; Chas. F. Rogers; C. G.

CHAS. A. ROGERS,

Secretary and one of the prime movers in connection with the organization of Hamilton master plumbers, which held a series of successful meetings last winter and who thanked Page-Hersey Tubes, Limited, on behalf of the plumbers for the enjoyable outing provided on Tuesday last to Welland. Mr. Rogers is manager Standard Sanitary Mfg. Co., Hamilton, Ont.

noonday luncheon and inspection of this pipe making industry in the afternoon.

The invitation was extended by officials of Page-Hersey Tubes Ltd., to the master plumbers of Hamilton, Ont., who, under the guidance of Secretary Chas. A. Rogers, local manager, Standard Sanitary Mfg. Co., Percy Moore, Wm. F. Newell, W. Brittain, J. Allen, F. Lang, W. A. Canning, Harold A. Rogers and J. R. Thompson, have formed

WM. NEWELL,

Hamilton, Ont., Committee member of the Hamilton organization of master plumbers, who assisted in the successful arrangement of the outing to Welland.

Stewart, president Ontario Society, D. S. & H.E.; G. F. Frankland, secretary Ontario Society D.S. & H.E.; Mr. Duff, proprietor of the Welland Tribune, and others.

During the dinner the crowd participated in the singing of a great many songs with great gusto under the active and capable leadership of Harold A. Rogers and his resonant voice. A splendid feeling of good fellowship prevailed and everyone joined in the singing. Special numbers were rendered by Tom Jenkins and Captain Wotherspoon. A novel feature which was carried out so capably that it threw a scare into some

Sanitary Engineer Camera Man With the Plumbers

Group of plumbers from Hamilton with visitors from Brantford, Toronto, St. Catharines, and other points, photographed by Sanitary Engineer outside the hotel after dinner at Welland, Ont., just before starting for the inspection of the Page-Hersey Tubes, Ltd., Plant.

of those present, was when E. Cardwell of Welland took a violent fit and was seized and placed on a table. The surgeon upon being called pronounced an operation immediately necessary. His kit of tools when dropped on the floor shook the hotel, but he proceeded immediately to work under the vest of the patient with his forceps. It was necessary for him to place his knee on the patient's chest and pull with all his might before he was able to bring relief to the sufferer by pulling out a huge liver. The patient was enabled to proceed with his meal after the operation, though some opined that as the organs which had been removed had been taken from near the chin, that he must have been "a high liver." Others thought it a pretty "raw" trick.

A Novelty

Another novelty introduced toward the end of the meal, fortunately, was the visit of a noted worm specialist, who lectured on the connection existing between the plumber and the health of the community. As an example of what worms would do, certain tablets and matches were passed to each person. Upon being lighted, the tablet immediately assumed the proportions of something more nearly resembling a snake than a worm and the Professor made his exit amidst much laughter.

At the conclusion of the dinner and the toasts, Mr. Rooke spoke briefly, welcoming the plumbers on behalf of his company. He stated that the company felt honored by the presence of

such a representative group of craftsmen and that he had been looking forward to just such a gathering ever since his visit to the men in their own organization in Hamilton. He outlined the program to be followed.

C. A. Rogers spoke on behalf of the plumbers present, pointing out that the gathering was in continuation of the educational and social efforts being made by the group which had been organized in Hamilton and that they were glad of the opportunity of mixing pleasure with instruction, which was provided by the dinner and visit to the

PERCY A. MOORE,

Hamilton, Ont., Committee member of the Hamilton organization of master plumbers which had another of its successful meetings at Welland in connection with the dinner given by Page-Hersey Tubes, Ltd.

Page Hersey plant. He introduced an old friend of his, Mr. Duff, proprietor of the Welland Tribune, as the chief speaker.

Some Secrets

Upon rising to speak Mr. Duff, known in the local Rotary Club and other organizations as "Plum Duff" let the gathering in on some secrets concerning certain members. He hoped that the operation performed on their local craftsmen had been successful in removing some of his "gall" and that if so he would be a better man. He told how Major Anthes had been responsible for considerable of the editorial opinion of the Toronto Telegram in years gone by, when that paper had once cast aspersions on Hamilton by showing under the heading "A bird's eye view of Hamilton" a picture of a small frame building on a hillside on which was the sign "Spectator." A small hill in the background was the Hamilton mountain. Mr. Duff could not see how Hamilton craftsmen could think so much of Major Anthes after that, especially when he had sunk from the realms of journalism to be a manufacturer of cast iron pipe.

After these banalities, Mr. Duff straightened away to a very interesting talk on the early history of Welland and district, from the time the red men made munitions there down to later times, and subsequently to the developments in connection with the canal which, as he stated, is soon to change the whole aspect of the peninsula.

(Continued on page 29)

Heating and Ventilating Department

Asks for Suggestions for Improvement of Plan for Heating Water Tank

Heating a Thirty Gallon Tank With a Bent Pipe Coil in the Furnace, the Tank Being About Twenty Feet From the Furnace—
What Size of Pipe Should be Used?

Editor Sanitary Engineer:

Would you please look over the sketch sent under separate cover, for a 30-gallon tank to be heated with a vent pipe coil in a furnace. The tank will be about 20 feet from the furnace. I could put it 10 feet if you think best. Would it give better satisfaction by having the tank beside the furnace? Would you consider galvanized pipe better than $\frac{3}{4}$ inch?—C. W. Barker, London, Ont.

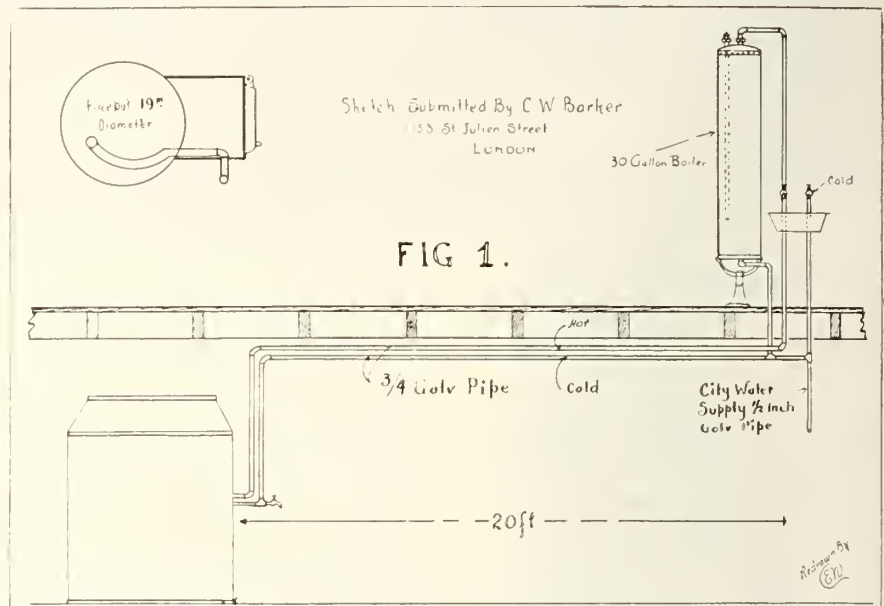

Answer: The sketch submitted by our inquirer is shown in Fig. 1, and it will be noted that the cold water supply is connected to the return pipe on the heating connections. This should not be so connected. As a matter of fact there is quite a difference between heating pipes and supply pipes, and, when installing such a job there would be possibility of disturbance in the flow or return of heating pipes.

Let us assume, however, that this job was installed. There would be a tendency to get the hot and cold water mixed and without doubt the hot water when expanding would find relief through the cold water faucet if it was opened at a time when all the water in the range boiler was at a high temperature. Furthermore, there would be a strong tendency for the cold water to be forced through the coil in the furnace when the hot water faucet was turned, thereby leaving the hot water in the range boiler.

Regarding the distance between the furnace and the range boiler, this would be better if placed as close to the coil as possible. If there is no objection to the range boiler being placed in the basement near the furnace, such a position would be preferable every time.

Figure 2 shows the proper way to make this installation. Note that the two heating pipes have absolutely no connection between the cold and hot water, which is as it should be.

If our reader will follow the pipe lines in Fig. 2 it will be seen that the cold water supply is connected directly with the range boiler, (see tube in boiler.) As soon as the hot water faucet is opened the cold water is delivered to the boiler through the tube, forcing the hot water out at the top of the boiler through the hot water faucet. On the other hand when the cold water

faucet at the sink is opened, cold water flows direct from the city mains to the faucet opened.

With regard to the size of pipe to be used, we would advise 1-in. pipe for the coil and piping to the point where the heating pipes turn to a vertical direction, using a 1-in. by $\frac{3}{4}$ -in. elbow looking up on the top, or flow pipe, and on the bottom pipe, or return, use a 1-in. by $\frac{1}{2}$ -in. by $\frac{3}{4}$ -in. tee.

The reason why the trap is forward on the lower pipe is so that all the sediment can be drawn off the coil through the $\frac{1}{2}$ -in. faucet.

The same method should be adopted of connecting the boiler up in the basement.

—Technical Editor.

"THINGS ARE IMPROVING"

(Continued from page 17)

in addition to a large proportion of the nickel, to say nothing of our other mineral deposits.

"There is justification for optimism and faith, but it is not enough merely to say 'Every day in every way, etc.' That may help, but if we have the desire and the will to excel, we will get there.

"Considering the upheaval of the war I am surprised that we have got reconstructed to the present stage in the short five years since the war. I cannot see how things could be expected to be much better than they are to-day. You who have visited the Fair and noted its growth and the quality of the goods shown cannot help but be optimistic.

"I believe optimism is justified regarding the present and future condition of our country and I would not take that stand unless I was convinced. There are difficulties in the way which we must surmount. What kind of a world would this be if we did not have difficulties? What are these difficulties for but to surmount? If it was downhill with the wind in our backs all the time it would be very uninteresting. Honest labor is one of the zests of life and a great builder of character."

Mr. Motherwell was followed by Hon. J. S. Martin, Ontario Minister of Agriculture, who drew attention to the large crowds of well dressed, happy and prosperous people attending the Exhibition as an indication of justifiable optimism.

"Farm product prices are not bad compared with pre-war prices," said Mr. Martin, "but the farmer says, 'When we

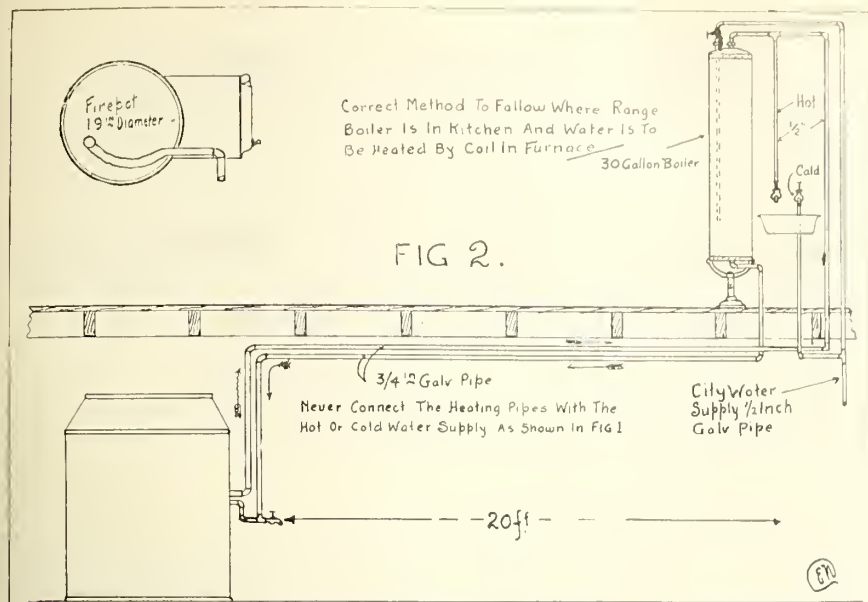

FIG 2.

sell we take what the buyer offers and when we buy we have to pay his price.' Some manufactured goods are passed on to the retailers by manufacturers who wash their hands of them and the dealer often forgets that the war is over.

"The average farmer in Ontario is not going into debt. There are some exceptions where farmers bought land at the peak and have to pay high interest charges where, with little farming experience, they are suffering, but there are few of them and they do the most talking. The ones who are making money are the ones producing good products. There is too much poor stuff being produced on our farms. It is a matter of education."

Pointing to the value of associations among farmers to encourage better production, Mr. Martin outlined the work of the Norfolk Association in Ontario. By insisting upon regular spraying and uniform system of packing, the apples produced by members of this association are in much greater demand than can be supplied, whereas apples in other parts are said to be rotting on the trees.

"There is no reason to be discouraged over the agricultural outlook. The present is a natural condition, it stresses the need of quality and efficient farming and things are certainly showing improvement right now," said Mr. Martin, in conclusion.

HOPE TO SAVE \$100,000

Toronto, Ont.—This city hopes to save from \$75,000 to \$100,000 by the regulation of water charges, according to the number of taps and appliances used, and the amount of water consumed. It is intimated that an equitable distribution of the charges may even make possible a slight reduction in the rates. A question to all water-users, for the purpose of ascertaining the number of taps and appliances in use on the premises, is the first step in the campaign.

"Plumbing that lasts. Time is the judge," is the caption that accompanies a cut of Old Father Time seated in a bathtub in the advertisement of John Daisley, Prince Albert, Sask.

Want Some Last Minute Changes Made in New Sales Tax Regulations

Objections Made by Some Hardware Wholesalers That Tax is Not Sufficiently Concealed—Difficult to Establish Costs on Individual Articles

ALTHOUGH the budget provisions and amendments covering the question of the sales tax were announced during the month of May, the firms which will be affected by the tax are still somewhat in doubt as to how various clauses of the regulations will be interpreted by the Government. To date, no rulings have been issued, although they are expected to appear at any time now, in order that those interested may thoroughly digest their contents before January 1, 1924, when the provisions of the Act come into effect.

Another reason why these rulings are awaited with more than a passing interest by the trade is contained in the fact that there are certain clauses in the Act which, if interpreted as the majority of those who have studied them feel that they will be, a certain amount of dissatisfaction may result.

Local wholesalers and jobbers have recently discussed the matter, but have refrained from making any representations to the Government for amendments or alterations pending the issuance of the Government rulings, the idea being that it would be futile to ask

A timely advertisement in the form of a paid reader in the news columns of the local daily is used by F. H. Hamilton, Kingston, Ont., who heads his reader: "Plumbing and Heating Plants Should be Examined Soon."

The copy reads: "There are many wise people who lay in a supply of coal and wood during the summer months, and then, like the busy ant, they have no worries in the winter when the cold spells get their less thoughtful neighbors into trouble. Important also is the inspection of your plumbing and heating system throughout the entire house—for of what use is coal and wood if the furnace into which it goes or the plumbing system in connection with it should happen to be out of order, or in such a condition that the first attempt to use it would cause disaster? Sometimes a little, unnoticed flaw, or worse still, and more frequent, some defect that is known but is allowed to run along without attention, will cause a great deal of trouble and loss in the very coldest months of the year when every part of the plant should be at its best.

"Be wise and see to your plumbing needs now while the plumber has time and while you do not need your plumbing plants. Call F. H. Hamilton, phone 1420W, or drop a line to him at 131 Alfred street, for satisfaction in all kinds of plumbing and heating service."

for changes until it is known definitely what interpretation is to be given. A change might be asked for that would be entirely unnecessary under the Government's ruling, provided that ruling were somewhat different from the interpretation now being taken out of the particular clause.

Not Altogether Concealed

One of the principal objections made by the trade to the Act as it stands at present is that the six per cent. tax is not altogether a concealed tax, it being felt that a concealed tax would be much more preferred, and eliminate much extra figuring and waste of time.

Under the Act, a licensed producer, manufacturer, wholesaler or jobber selling to an unlicensed wholesaler has to show separately on his invoice the amount of tax paid, a procedure not viewed favorably from either end.

In the first place, the purchaser looks at the notation "Tax Paid \$—." He knows that this is six per cent. on the original cost of the goods, so by a simple calculation, he is able to ascertain what the original cost was and

Tinsmithing and Sheet Metal Work

Blow Pipe Manufacturers Make Y Branches With Sides Made in One Piece

These Branches Require New Development of a True Section Through the Mitre—Working Drawing Shows How Pattern is Made

Written for Sanitary Engineer by O. W. KOTHE, Principal St. Louis Technical Institute

MANY blow pipe manufacturers are beginning to make Y branches similar to the one shown in this working drawing. The idea is that both sides are made in one piece, so that the seam will run down the line 10-11 and 9-10 of the elevation. A sharp bend is made along the line X-1 and from this the semi-circles are shaped out. In branches of this kind, there is no throat, as both branches come together in point 1 and the collars that attach to the edges produce the throat.

First, draw the base line for section A, as 9-10, and then draw the angles for the branches, making the height at pleasure, and then draw the angles of branches 1-10 and 1-11 to suit the diameters of those pipes, as at C and D. In order to proportion the area through the bend, take one-half the diameter of the small branch C or the distance 4-10 and set as 9-X. This point X will be the starting point for the bend line, and both branches will be laid out from this line. After this describe the sections B and C in the same number of parts we have in A. From X draw lines in branch C to points 1-2-3-4 and then triangle the remainder as 4-5, 5-6, 6-7, etc. Observe that the point X in A establishes a part of an arc, and hence, the remainder of the section is divided in three parts to correspond with section C.

From X draw lines to the point 1-2-3 of B and after this triangle the lines as 3 to 4, 4 to 5, 5 to 6 and 6 to 7.

Branches of this kind require new development of a true section through the mitre, as the old style branches do, while true lengths are developed in much the same way. The one at N is for the small branch and at M is for the large branch. Developing the small branch lines we pick them as X-1-2-3 and set them on a horizontal line. Then from the starting point we erect a line equal to the length X in section A. On the other ends, we erect lines to equal those half diameters in section C, as 2-3. After this pick the line 4-5 and from the last point, 4, we set over on a horizontal

line and erect a line equal to the line 4 in section C. After this we pick line 5-6 and from 5 on base line we set over and erect a line equal to section C, line 6. Repeat this until lines 8-9 and 9-10 are determined. The true lengths for

the smaller prong are developed in the same way and are set in diagram M.

To start the pattern draw a line and make it equal to X-1 of N, and then pick the girth as 1-2 from B, also 1-2 from C, and describe the small arcs from point

Standardizing of Register Sizes, Furnace Pipe and Fittings

Resolutions Favoring Certain Sizes to be Further Discussed

THERE is a movement under way to standardize on register sizes as well as on furnace pipe and fittings and thus eliminate what many claim to be a large number of needless sizes.

At the last meeting certain resolutions were adopted. These with additional propositions will be discussed further. The resolutions are printed in the following:

Resolutions Adopted

For sidewall registers:

That register box openings be at least of equal capacity to the leader pipe serving it.

That 8 x 10-in. registers have a throat of $6\frac{1}{2}$ x $10\frac{1}{2}$ in. outside measurement, with a $2\frac{1}{4}$ -in. base extension.

That 9 x 12-in. registers have a throat of $6\frac{1}{2}$ x $12\frac{1}{2}$ in. outside measurement, with a $2\frac{1}{4}$ -in. base extension.

That 10-in. leader pipes have a 10 x 13-in. register having a throat $6\frac{1}{2}$ x $13\frac{1}{2}$ in. outside measurement and a $2\frac{3}{4}$ -in. base extension.

That 12-in. leader pipes have a 12 x 14-in. register, having a throat of $8\frac{1}{2}$ x $14\frac{1}{2}$ in. outside measurement and a $4\frac{3}{4}$ -in. base extension.

In connection with the above a recommendation was adopted that 11 x 13-in. registers also be made for 12-in. pipes as optional for installations where a 10-in. leader is too small and a 12-in. pipe too large for the room requirements,

under which condition an 11 x 13-in. register will serve the purpose.

That 14-in. pipes have 16 x 14-in. registers with a throat of $11\frac{1}{2}$ x $14\frac{1}{2}$ in. outside dimensions and a base extension of 8 in.

That registers of the same base extension shall be used, in corresponding sizes, for both first and second floors.

That a height of $2\frac{1}{4}$ in. from the floor line to the opening be recommended to register manufacturers as a standard measurement for roughing in sidewall registers.

A resolution was also adopted that furnace pipe manufacturers make only one size collar for the boot for which it is intended, viz.: 8-in. collars for 8 x 10-in. registers; 9-in. collars for 9 x 12-in. registers; 10-in. collars for 10 x 13-in. registers; 12-in. collars for 12 x 14-in. registers.

The meeting also went on record adopting a standard of one size larger over the single head for collars on boots for double head registers.

The following sizes for floor registers were adopted as standard:

8-in. pipe: 8 x 10-in. register.

9-in. pipe: 9 x 12-in. register.

10-in. pipe: 10 x 12-in. register.

12-in. pipe: 12 x 14-in. register.

14-in. pipe: 14 x 16-in. register.

16-in. pipe: 16 x 20-in. register.

This recommendation for floor register sizes carries with it the pipe sizes given with them.

1 in the pattern. In the same way pick the spaces from A as X-4 and X-5 and set them in pattern as the arcs show. From here on we develop each branch separately working the smaller first. So pick the true length X-3 and describe this, using X in pattern as the center, cross arcs in point 2. Then describe arc 3 and pick true length X-3 and describe this, using X in pattern as the center. Repeat this with point 4 and then pick line 4-5 from N and using 4 as centre in pattern cross arcs in point 5. Then strike arcs 6 and 7. Cross these with true lengths 5 and 6, and 6 and 7, from N. Continue in this way until points 9-10 are established. Repeat this same process for the large branch, only using the true lengths from N and the girth spaces from band A.

This gives the net outline of the pattern and edges for riveting on the ends must be allowed extra, as well as for riveting to the collars. To assemble this branch bend the line 1-X in a cornice break, or over a stake quite sharp, seeing to it that the bend is considerably deeper at the top than at the bottom, where it should hardly be noticeable, because this base must form a complete circle and have no off-sets. Then shape up the sides to form semi-circles, taking care that the shape is as near to the actual fittings as possible, because that

makes it easier in riveting together and fitting the corners on. Sometimes it is necessary to wrap a wire around the small ends, in order to hold them in position while putting the collar on, because they are apt to enjoy an elongated shape. If the collars are riveted on to this elongated shape, it is rather difficult to straighten them out and, therefore, the workman must always see that the ends are perfectly round before he goes ahead too far.

WANT SOME LAST MINUTE CHANGES

(Continued from page 21)

knows at once the profit being made by the vendor. Naturally, the vendor does not care to have this part of his business known to each purchaser and would prefer a concealed tax where it would be possible for him to include the tax in his sale price without making a separate item of it on the invoice.

Nor is the purchaser, even though he may secure this information, entirely satisfied with the Act as it affects him in such cases. Often, he will be making purchases of a large assortment of goods in dozen, half-dozen and other sized lots.

These will appear in itemized form on the invoice, the costs totalled up and

then the tax item added on separately. This means that to learn the actual cost of each item on the invoice, the purchaser will have to figure it out for himself, taking up valuable time that might be used to better advantage elsewhere, whereas if the tax were a concealed one, it would be included in each item, thus making the full cost of each item clear at a glance and eliminating all the extra work.

There are other minor points on which all members of the trade are not in accord but they are points not so general, nor do they stand out so prominently. In the case of most of these, it is presumed that the Government rulings will clear up most of the misunderstanding now existent and that the Act as it comes into force on January 1, 1921, will prove acceptable to the average business firm in almost every respect.

CONVENTION GOES TO FORT WILLIAM

Fort William, Ont.—The 1924 convention of the Sanitary Inspectors' Association will be held in Fort William, it has been announced by Sanitary Inspector A. J. Bolus, who attended the recent convention in Calgary.

Letters to Prospects for Water Closets, Heat Conservation Material and Sanitary Sinks

FIRM LETTERHEAD

Date.....

Dear Mr. (or Mrs.).....

Are you embarrassed by the noise your old water closet makes?

Are you ashamed of the growling and hissing that can be heard throughout the house—particularly when there are visitors around?

Then it's time to replace the old-fashioned, insanitary water closet with one that is silent and sanitary. During Good Health Week, your friends and neighbors who read the same newspaper that you do, will learn how easy it is to get a new water closet or any other plumbing fixture on our easy terms. Many of them will visit our store, to see for themselves how modern, sanitary water closets protect the health of the home.

Don't be disturbed over the disorder caused by the exchange of the new closet for the old. It will be slight, unless your hidden plumbing is in bad condition. (In that case, it's best to call us at once, before a doctor is needed!)

During Good Health Week, or at any other time, you are invited to come to our store to see every modern plumbing fixture. You'll be surprised at the low cost of good plumbing—and especially, the moderate price of a sanitary water closet.

Yours for Good Health and Sanitation,
YOUR NAME HERE

FIRM LETTERHEAD

Date.....

Dear Mr. (or Mrs.).....

Any person, family or business, in order to be thrifty, must learn how to save. It is a wise home-owner who uses every precaution and takes advantage of every opportunity to save heat in these days of high-priced coal. Since wasted heat is wasted money—you will appreciate the following suggestion.

Ninety-five per cent. of all basements, according to reliable statistics, are over-heated. The over-heating is due to bare pipes and uncovered furnace or boiler, and is a constant drain on the coal pile.

The loss of fuel by wasted heat has been given more serious thought by the public this season than ever before, and has resulted in the largest sale of (.....) pipe covering and asbestos boiler cement we have ever known. To customers who ask why we did not bring this preventable loss of heat to their attention before now we reply that never before was there so great a need to save fuel.

(.....), pipe covering forces the pipes to convey every bit of heat from furnace or boiler to the rooms to be warmed. The saving is much larger than you can imagine. We have some interesting figures that we would like to show you on the first opportunity you have to visit our store. We shall expect you soon.

Yours for more heat from less fuel,
YOUR NAME HERE

FIRM LETTERHEAD

Date.....

Dear Mr. (or Mrs.).....

Milk and cream is pasteurized, and dairy herds are tuberculin tested; meats and canned foods are carefully inspected; fruits are shipped in refrigerator cars. Yet, despite these precautions, only the vigilance of the good housekeeper protects the family's food from contamination.

Especially in Summer, there is a danger of foods becoming unfit for use. Icing protects food only while in the Refrigerator. After that—it's up to you! The kitchen Sink, where so much food is washed and prepared—if old-fashioned and insanitary, can easily be the source of serious illness.

A modern Sink is impervious to grease and bugs, and cannot harbor disease germs. Made of one solid piece of enameled iron, porcelain or vitreous china—it has no cracks or crevices. It can be cleaned—clean—in the twinkling of an eye.

A modern, sanitary Sink set at proper working height, with hot and cold water connections, is a great labor-saver, too. See them on display in our store during Good Health Week, or at any other time convenient.

Yours for a sanitary kitchen,
YOUR NAME HERE

Displaying Sanitary Equipment for Good Health Week Campaign

Established Week in October for Good Health Can be Prepared
For by Plumbers and Heating Engineers to Good Advantage—
Two Effective Window Displays of Closets

YOUR windows are forcible advertising mediums. Get the full value out of them by keeping them attractive.

The window on the right offers another excellent method of advertising quality water closets, as well as an opportunity of tying up with "National Good Health Week." This window should prove unusually attractive because it lets the public into some of the hidden mysteries of a water closet bowl.

The window is simple to construct. All that is required are three boxes twenty inches higher, three boxes thirty-six inches high, and six closet bowls. (Two bowls are washdowns, two of the reverse trap pattern, and two with syphon jet.) About fifteen yards of (grey ramie) cloth is also needed to drape over the boxes to cover the floor. This is a soft material that can be purchased at any dry goods store, and gives a soft, pleasing finish to the window. It can also be used from time to time in other windows to take away the hard lines that are so difficult to get rid of in windows showing appliances and fixtures.

The cross sections of the closet bowls can be obtained from some pottery or they can be painted on a card or beaver

board. The latter is just as desirable, and any sign painter can make these cross sections for you, or if you are handy with the brush, you can make them yourself. The cardboard is first cut out in the shape of the bowl. Then it is painted white with white water color paint. The outline is painted on with lamp-black mixed with bronzing liquid. Light blue or light grey water color is used to represent the water. Also use the blue and grey water color paint to show the water line in the bowls on the tall boxes as indicated in the accompanying photograph.

Have a sign painter reproduce the signs shown in the photograph below and your window is complete. The streamer at the front of the window should run the full width. The "Good Health Week" emblem should be about two feet across, and should be reproduced exactly as shown in the window. The only other sign is a question, directed to the public, that will draw them into your store, or start them discussing your window with other people. It is just such results that give the show window the name of the silent salesman. Give your windows a little thought, time and attention, and

they will repay you over and over again in added prestige and profits.

The window display on the left most forcibly impresses upon the mind logical reasons why the modern, indoor, sanitary water closet should be substituted for the dangerous outhouse. The window is not difficult to build, yet, it presents a most effective selling picture to the passerby.

Beginning two feet back from the glass, erect a false floor the full width of your window about fifteen inches higher than the window floor. This false floor should be at least three feet deep. At the rear, and in the center of the window, on this false floor, set up a high grade water closet combination that you ordinarily carry in stock.

Use a piece of beaver board or similar material about twenty inches wide running the width of your window, to form a front for the false floor. The top of the beaver board should be cut irregular to represent the unevenness of the ground. On this paint a cross section of a well, as shown in the accompanying photograph; and paint a (grey) streak, to represent a fault or vein in the

Sanitary Engineer

Plumber and Steamfitter of Canada

ESTABLISHED 1907

Member Audit Bureau of Circulations

PUBLISHED TWICE MONTHLY BY

The MacLean Publishing Company, Limited
 Montreal TORONTO, CANADA Winnipeg

Vol. XVII SEPTEMBER 15, 1923 No. 17

Set the Ball Rolling

THE inefficient methods and lack of stimulative measures employed by some plumbers are responsible for the state of their business which compels them to shout blue ruin. The same things are true of many other industries, notably agriculture, as set forth clearly in this issue. The plumber or heating engineer who is seeking new fields for trade and placing his business on a more efficient basis is being rewarded with results for his work. One of the chief things to keep in mind is that the most successful business men have not depended to a very large extent upon taking business from their competitors, but in increasing the volume of business in their field. Waiting for plumbing and heating contracts to be let, putting in bids and doing a good job will get a certain amount of business, but if the territory is studied and the business possibilities examined, many opportunities will be found for business which others have neglected. For instance, there are many homes with unsanitary plumbing, no water heaters, and without laundry trays. It is part of the merchandising plan which plumbers should adopt to take measures to make these sales.

Financial success comes to the plumber who gives real service in the community and it is the kind of success which is not begrudged him by townspeople. There are many ways in which business can be stimulated right now. With Fall approaching, heating equipment is to be looked over, additional lavatory equipment in homes can be provided, heat regulators can be installed, insulation equipment on heating plants to conserve coal, etc. Steps should be taken to start business coming on these lines right now.

Inefficients Make Most Noise

THE Canadian farmer to-day is the man to whom the sanitary engineers of the country must turn if they would penetrate deeper into a field which still has untold possibilities. There have been tales told of the sorry plight of the farmers of our country and the financial difficulties in which they have found themselves of late, but the truth of the matter is that the average Canadian farmer is in a much better position to-day than many persons think.

Only recently, Hon. W. R. Motherwell, Federal Minister of Agriculture, and Hon. J. S. Martin, Minister of Agriculture for Ontario, himself an experienced farmer, made the statement that the average farmer is making good and not going into debt as has been claimed. They admitted that there were some farmers going into debt but claimed that in most instances these were the misfits who are to be found in every form of occupation and those others who had bought their farms at peak prices and were now unable to stand up

under the heavy interest payments. The farmer who knew his business and was striving for quality production had a bright future.

Hon. W. R. Motherwell, Minister of Agriculture in the federal government, touched on the Western farmer and what might be expected following this season's record crop, saying that the money that would flow in from upwards of 400,000,000 bushels of wheat, even if the price were low, would be millions, millions that would pay debts and help to rehabilitate the whole western area. He went on to point out that when this was possible only thirty-five years after the West began to produce wheat, that the possibilities of the future had not been reached by half.

"Canadians should think these things over and take new courage," he concluded. "They have a wonderful future."

If he had been addressing a gathering of plumbers of the country, Mr. Motherwell could not have spoken to them more directly than he did in this message. One of the greatest potential purchasers of plumbing in Canada to-day is the farmer, and with these predictions of even greater rural prosperity to come, now is the time for the plumber to figure out how he can best secure his share of this business.

No Room for Reds

OFFICIALS of the American Defense Society discount the protestations of the Soviet Government of Russia and some American statesmen who have toured Russia recently that communists have abandoned their plan of spreading their propaganda throughout the world. According to recent information from a most reliable source, the Third Internationale has recently appropriated five million gold rubles—equivalent to \$2,500,000 in United States money—to be used in influencing newspapers outside of Russia to spread Bolshevistic propaganda. According to statements by Third Internationale officials, the communist government is maintaining approximately 250 newspapers outside of Russia for the dissemination of propaganda to promote disloyalty in capitalistic countries, and to urge the overthrow of governments by force and violence. Four of these newspapers are published in the United States.

"Secret Instructions to Commercial Representatives of Russia in Foreign Countries," a copy of which is now in official hands at Washington, notes that efforts must be made to buy up the press and win over newspapers which will place themselves in the service of communism. This interesting document directs Russian commercial representatives throughout the world to aid pacifist movements to spread communism in armies and navies, to inspire in soldiers and sailors hatred of their officers, to start strikes and aid strikers, to organize "workers' troops" who must fight at the bidding of the proletariat, "to supply workers with weapons, to encourage the use of terror, and constantly to continue the spreading of rumors of impending wars."

The red element has been and is now exceedingly active in Canada. There have been some open demonstrations of their activity, but the general public is not aware of the extent to which the insidious propaganda is being carried on in this country. The red element must be kept down. There is no room for reds in Canada. Government officials must take a firm stand and use troops when necessary to stem the tide of Bolshevism. It would also be well for some weak kneed government officials to remember that the Canadian people do not think it necessary to offer apologies to the red element. When troops are used, they are used to preserve law and order and the sooner the reds are made to understand this (without apologies) the better for all concerned.

Doesn't Fool the Public Any More

IN THIS era of modern enlightenment and sophistication it behooves the dealer who advertises goods at "less than cost" to recall the maxim of Abraham Lincoln, "You may fool some of the people all of the time, all of the people some of the time, but you can't fool all of the people all of the time."

The people of this age look upon the "less than cost" assertions as bunk, to delve into the everyday parlance. There is exhibited a tendency to remind the buying public, on the part of certain dealers, that these dealers are in business for a profit, and selling below cost is not in their repertoire or in the repertoire of any other dealer regardless of the claims of some dealers to the contrary.

For instance, in Moneton, N. B., there is a man who makes the following announcement, more or less as a business slogan:

**OF COURSE WE PROFIT HERE
BUT
WE DO NOT PROFITEER**

Another maritime concern makes the following announcement: "As our health is quite good as a general rule, barring the flu and a cold now and then, and a headache and a toothache and earache occasionally, we are not in this business for our health. We opened this store to make a profit on each article we sell over our counter. We have overhead expenses to pay all the while. Now, we could tell you we are selling below what the goods cost us. But that would not be the truth. Later on when we become millionaires we may start giving things free. But that stage is far distant. On each article we sell we secure a profit, not an unreasonable profit, but a fair one. We make it a point to get the best of stock, and the best of customers. If you are seeking something below cost go elsewhere. And you will be disappointed. For there ain't no such animal as below cost prices. This frank statement is made to clear the air."

The public is being educated to believe that extravagant claims are worthless. The flamboyant advertising of some classes of merchants in claiming sales at less than-half the cost, is creating a distrustful impression among the people, according to some dealers, and the entire trade is suffering.

First Steps Toward Better Buying

Minute Message No. 29

Written for Sanitary Engineer by FRANK STOCKDALE
Buying Series

IF FAST and slow moving goods could be as quickly separated and classified as some other things, the buyer's job could be made easier.

To know definitely what and how much to buy in the future should depend upon what and how much you bought in the past. A buyer cannot afford to guess.

Stock records showing purchases, sales, mark-up and stocks on hand enable the buyer to choose with greater certainty.

Records which show rate of turnover furnish facts that are vital to profit making.

At the best, there is always room for judgment.

Slow movers with attractive mark-ups seldom pay.

Fast movers with fair mark-ups are safe.

Buy sparingly of the former and freely of the latter.

THINK IT OVER--APPLY IT TO YOUR BUSINESS

News Notes From Coast to Coast

Doings in the Plumbing and Heating Industry

NEW FIRMS

The McMillan Plumbing and Heating and Tinsmithing Co. has commenced business at McMillan and Daly Streets, Winnipeg, Man.

Montreal, P. Q.—Announcement is made of the dissolution of the partnership existing under the name of Lavigueur and Menard, plumbers.

A tinsmithing and repair business is being opened on Archimedes Street, New Glasgow, N. S., by J. Roach MacDonald, who has been employed for a number of years in the tinsmithing department of Thompson & Sutherland.

BUSINESS CHANGE

Dunnville, Ont.—Wm. McGregor & Son of Hamilton, formerly well-known residents of this town, have purchased the plumbing business of the late George Calbeck.

The tinsmithing and plumbing business of W. A. Derry, Smith's Falls, Ont., has been taken over by Messrs. Spooner and Gloss, the former a local man and the latter from Carleton Place, where he has been for the past fifteen years head plumber with Taylor Bros.

NEW DRINKING FOUNTAINS

Oshawa, Ont.—Two modern type bubble fountains have been ordered and will be installed without delay, according to Town Engineer Smith. Definite locations for the fountains have not yet been selected.

PLUMBER'S ASSISTANT BURNED

Montreal, P. Q.—Rosaire Gaulin, seventeen-year-old plumber's assistant with the firm of L. Allard & Co., Montreal North, was severely burned about the face, arms and hands, in a blaze that started from the explosion of gasoline in a blow torch. He was working in an attic at pipes in the roof and wishing to heat a section of the pipe, was pouring gasoline into his blow-torch when the explosion occurred.

NEW MAIN FOR MONTREAL

Montreal, P. Q.—A sum of \$235,000 has been put at the disposal of the Water Board. Of this \$185,000 will be devoted to the installation of a 24-in. water conduit, one of 20-in. and another of 16-in. in diameter. This main is required on account of improvements to the high pressure system in the Papineau district and will allow the new 12,000,000 gallon pump at McTavish reservoir being utilized. The remainder of the money will be spent in the embellishing of the approach to the new pumping station at Atwater Ave., making roads and laying sidewalks to the station.

NEW PUMPING STATION TESTED

Georgetown, Ont.—The new pumping station, an auxiliary system for fire and emergency purposes, which draws its water supply from springs a mile from the town, has been tried out by the firemen and has proven satisfactory in every way.

KAUSTINE CO. TO EXPAND

Dundas, Ont.—Plans are under way for the enlarging of the plant of the Kaustine Co., manufacturers of sanitary chemical closets and septic tanks. President J. F. Crowley states that a new factory building, 60 by 120, is under consideration and that there would also be a sheet iron storage shed and an office building.

OBITUARY

A survivor of one of the oldest families of Halifax, N. S., passed away recently in the person of John B. Naylor, aged 81 years. The late Mr. Naylor was one of the most prominent of the older generation of citizens, having been in the plumbing business for a number of years under the firm name of J. B. Naylor & Sons. He retired from this in 1900 and entered the Customs Service, in which he served until about seven years ago when he retired.

PLUMBING BYLAW OBSOLETE

Waterloo, Ont.—The plumbing bylaw in force in this municipality is obsolete and so constituted that it would never secure the sanction of the provincial authorities, according to representations made to the Town Council by Town Engineer Moogk, who advocated that the regulations be brought on a par with those in force in the nearby city of Kitchener. Kitchener has the provincial regulations. The Council appointed a committee to consider the present bylaw and report a new bylaw if thought necessary.

MUST USE SANITARY SYSTEM

Oshawa, Ont.—A. Robinson was fined \$1.00 and costs for not complying with the bylaws regarding sanitary conveniences and N. Kohen was let off on suspended sentence in connection with the same bylaw when they were brought into court recently under complaint by Councillor Brown, chairman of the Sanitary Committee, who is making a drive to have the city's sanitary system made use of by all householders. Future fines will be much heavier.

NEW SITE FOR COMFORT STATION

Vancouver, B. C.—The city council is still at a loss for a site for the new comfort station, objections having been raised by citizens to every site suggested to date. A special committee is now taking up the question at further length.

MAKE NEW WATER CONNECTION

St. John, N. B.—Connections with the new 36-inch water main have been made at Little River. With this connection made, the city now possesses two sources of supply, Loch Lomond and Little River, and in case anything goes wrong, there can be no serious interruption to the city's water supply.

ENGLISH COMPANY RE-ORGANIZED

Notification has been received of the purchase in liquidation of United Brassfounders and Engineers, Limited, Halifax and Ormskirk, England, by R. E. Hattersley. The business, which consists of the manufacture of valves, pipe fittings and allied lines, will be continued under the name of Hattersley Limited.

POOR PLUMBING TO BRING FINES

North Vancouver, B. C.—Merchants and householders who are wasting water through defective plumbing will be prosecuted by the city, it has been decided by the city council. The higher portions of Lynn Valley are suffering from a water shortage, probably due to waste of water in the city. A check is being made to detect all waste.

BROKEN PIPE CAUSES TYPHOID

Toronto, Ont.—The Department of Public Health has discovered that the outbreak of typhoid among prisoners at the Jail Farm was due to a broken water pipe which allowed the water supply to become contaminated. The break has since been repaired, and the water is being chlorinated so that there is no danger of further cases developing.

FEWER OUTDOOR CLOSETS

Peterborough, Ont.—The month of August saw further progress towards a sanitary city by the removal of ten outdoor closets and the installation of modern plumbing in their stead. This brings the total improvements of this class for the year to date to 81. Permits were also issued by Plumbing Inspector A. G. Methers, covering the following fixtures: 27 water closets, 8 baths, 10 basins, 21 sinks, 1 stop sink, 2 laundry tubs and 1 dishwasher.

SANITARY INSPECTOR APPOINTED

Bolton, Ont.—William Shaw has been appointed sanitary inspector, village constable and fire warden of the village. He will receive a salary of \$100 per year.

NEW SANITARY BY-LAW

Calgary, Alta.—Commissioner A. G. Graves and Superintendent W. H. Gardiner have started work on the drafting of a new garbage and sanitary by-law for this city.

TO COMMENCE BIG SEWER

Windsor, Ont.—Everything is in readiness to go ahead with the big Riverside trunk sewer extending more than a mile along Ottawa Street east from the Ford City boundary limits.

NEW PRESIDENT APPOINTED

Toronto, Ont.—Local representatives have been informed of the appointment of W. W. Crawford as president of the Edward Valve & Manufacturing Co., East Chicago, Ind., the vacancy caused by the resignation of Olaf E. Oleson.

WATERWORKS SYSTEM BEING INSTALLED

Kirkland Lake, Ont.—Construction of the town's waterworks system is proceeding rapidly, about forty men being employed on the job. Water and sewer mains are being laid simultaneously, but the latter will not be used until a proper place has been secured for sewage disposal.

DEFEAT SANITARY SCHEME

Mount Dennis, Ont.—By a vote of 13 to 9, the representatives of all the different ratepayers' associations in Mount Dennis turned down the proposal to expend the sum of \$15,000 in the improvement of the sanitary arrangements at Dennis Avenue School, together with the laying of sidewalks around the school yards.

GAS MAINS TO BE LAID

Toronto, Ont.—Gas mains will be laid on Blackthorn, Silverthorn, Rosethorn and Chambers Avenues as far north as Kersdale Ave. before winter, according to information received from the Consumers' Gas Co., by Thomas Donnelly, of the Ratepayers' Association. Services will be installed in over 90 per cent. of the houses in the area.

SECURED GOOD CONTRACTS

Oshawa, Ont.—Miller and Libbey, sanitary engineers, have secured a number of large contracts recently, among them being the heating and plumbing installation in the Service Building of General Motors, plumbing, heating and ventilation of the Assembly Building of General Motors, and plumbing installation for the new Centre Street school.

INSPECTED CONCRETE SEWER PIPE

Hamilton, Ont.—City Engineer McFaul has arrived home from a trip to Milwaukee where he inspected concrete sewer pipes in use there. He expressed himself as much impressed with the results there where concrete pipe has been in use for the past thirty years.

LARGE LEAKAGE OF WATER

Fredericton, N. B.—F. A. Barbour, consulting engineer, who is investigating Fredericton's water system, has expressed the opinion that the loss by leakage may amount to as high as fifty per cent. His report to the City Council has not been submitted as yet.

NEW DISPOSAL PLANT PROPOSED

London, Ont.—Plans for a new sewage disposal plant, to be constructed on the river bank near the present one at the Coves, will be prepared next year by City Engineer Near. The engineer points out that a new plant is absolutely necessary. The ratepayers will likely vote upon it in December, 1924.

CONTRACT FOR SCHOOL HEATING

Midale, Sask.—A vote of the ratepayers of the Midale school district, taken some time ago, authorized the procuring of ten-year debentures to furnish a modern steam heating plant to be installed in the four-room school. George Lythgoe, of Weyburn, was awarded the contract for the work, finishing the job in time for the opening of school.

DISPLAYING SANITARY EQUIPMENT

(Continued from page 25)

ground or rock, leading from underneath the outhouse and stable down to the well. Paint the remainder of the beaver board with lines and colors to indicate a cross section of the earth beneath the buildings, as shown in the picture.

At the higher end of this front, place a model of an outhouse. At the other side of the window place a model of a barn; and in the centre, immediately over the well, place a model of a pump, with a doll posed as operating the pump. At the rear of your window, raised somewhat above the level of the false floor, pose a model of a house, as shown by the picture. All of the buildings as well as the pump can be made of card or beaver board, painted with water colors to suit. Around and between the various objects on the false floor in your window, cover with green tissue paper, and over this spread either real or artificial grass or sod made of dyed sawdust or excelsior. Use weed tops or small branches of shrubs to represent trees and shrubbery. Have a sign painter to reproduce the signs shown in the accompanying photograph in colors to suit.

PLUMBERS MIX PLEASURE WITH INSTRUCTION

(Continued from page 19)

Proceeding with a brief bit of business Mr. Stewart announced that a committee appointed to consider the question of further meetings during the next winter season had met and recommended that ten dinners be held and that there be a membership fee of approximately \$2.50 per member to defray expenses apart from the actual cost of dinners. A standing vote of Hamilton members was unanimously in favor of continuing the meetings. A beautiful souvenir in the form of a valuable pipe and package of tobacco was given each one in attendance by Page-Hersey Tubes, Limited.

The dinner being adjourned, members again took to the cars and proceeded to the Page-Hersey plant. Under the guidance of Superintendent West, Mr. Rooke and other capable officials, the plumbers in parties of fifteen, were taken through the huge plant and each process explained fully. A great deal of interest was taken in the processes involved in the making of butt weld and lap weld pipe, fittings, etc., in both galvanized and black iron, in the wide range of sizes. The galvanizing process, involving the use of sal ammoniac and other acids, was of much interest, though some of the members were afraid of losing their eyes or throats before getting out.

The stages of manufacture were explained thoroughly, commencing with the skelp, which is the metal in long strips of varying widths as it comes from the producers in the United States. Skelp is made only by the Bessemer process, it being impossible to make it successfully on the open hearth furnaces, and it is therefore not made in Canada. After being heated these strips are rolled and butted or lapped into the shape of pipe and commenced on the other stages of finishing, winding up with a high water test to establish leaks, cutting, threading, tagging and grading.

The company operates its own machine shop for cutting of dies and making tools. The plant is now working to capacity, this representing about 300 tons of pipe per day. Considerable export business is being done, some heavy steam pipe being made for English trade, and other pipe being shipped direct to Australia.

When the inspection was completed the plumbers gave three lusty cheers for the officials of the Page-Hersey Co., and all agreed that their visit had been highly educational and valuable to them. Plans had been made for a ball game, but it was rather late when the inspection was completed, and after much hand shaking the motor cars were again started and the long trek homeward commenced.

Many Sanitary and Heating Engineers Visit Booths at the C.N.E.

Many Interesting and Complete Exhibitions of Plumbing and Heating Equipment Shown at Canadian National Exhibition—Hundreds of the Craft From all Parts of the Province Take Interest in Demonstrations

NEARLY a million and a half people passed through the gates of the Canadian National Exhibition which closed in Toronto Saturday, Sept. 8, after the most successful two weeks in the forty-five years of its existence. Each year has seen this, the greatest annual fair in the world, growing in every respect. Attendance has gone up with tremendous leaps, while each year has seen pace-keeping increases in the attractions and exhibits to be found on the grounds.

Among the exhibits shown are to be found practically every line of natural and manufactured product, not alone of Canada, but of many other lands as well. This being the case it is but natural that the members of the plumbing and heating trade have not been forgotten and that the many out-of-town members of the trade who visited the Exhibition found much to interest them in the booths in the Process and Machinery Buildings.

These visits have proven of inestimable value to plumbers in a number of ways. The latest improved devices and equipment have been placed before them, in charge of capable men able to explain the features and advantages.

The visitors in many cases met the heads of the companies with whom they

have been dealing, and in this way, have been able to build up a stronger feeling of friendship and personal contact. Talking with these men the visitors have in numerous instances gained much valuable information that will mean a great deal to them in the future conduct of their businesses.

Realizing that they would have a splendid opportunity to thus come into closer contact with their customers in the trade, the manufacturers of sanitary and heating equipment spared nothing in the way of expense in making their exhibits as attractive and as complete as was possible in the limited booth space at their disposal. Some of these exhibits presented appearances that were really outstanding in appearance.

Gold-Plated Washroom Fittings

One exhibit that attracted many visitors was divided into several sections, one end being made up as a bathroom with walls of imitation tile and showing a complete set of modern style bathroom fixtures in white vitreous, one of the features of the display being the built-in shower room and ten-head shower in one corner of the room. This was a portion of the exhibit of Crane, Limited, Montreal, P. Q., two smaller

divisions of whose booth showed rooms, one containing a stock pattern wash-basin in Carrara marble and gold-plated fittings and trimmings, and the other showing a complete moderately-priced bathroom. At the other end of the booth a wide range of valves and other brass goods were shown. At the end of the booth a gas water heater, cut down to show the method of operation, was shown, fitted up to a basin with running hot water on tap all day long. The exhibit was in charge of G. A. Vowell and A. E. Laidlaw.

Large Furnace Exhibit

A long booth in the stove building carried a large exhibit of warm air furnaces, coal stoves and gas stoves, manufactured by the Gurney Foundry Co., Ltd., Toronto, Ont. One end of the booth was devoted solely to a showing of furnaces, the other end formed an office for the handling of enquiries, while the space between was occupied with the display of coal and gas stoves. On a raised platform along the rear of this section the larger sized ranges formed a background for the smaller heaters and ranges shown in the fore part of the booth, the whole presenting a very pleasing appearance.

A wide variety of goods was to be found on exhibit in the booth of the

One of the prettiest sights at the Exhibition is the large fountain, and is but one of the many features that characterize the beautiful grounds of Exhibition Park.

A splendid view of the grandstand at the Canadian National Exhibition, showing the immense crowd that can be seated there and in front of which there is always an interesting performance.

Gendron Mfg. Co., Ltd., Toronto, Ont., where a neat railing effect around the exhibit was obtained by the use of a row of rubber-tired baby carriage wheels, then a row of small disc wheels from toy autos, and topping off this with a handrail formed of white enamel towel racks. In the booth proper were to be seen a wide range of toys and wicker furniture. The back and side walls of the booth were given over to neatly-arranged panel displays of bathroom fittings in nickel and enamel finish.

For Users of Alberta Coal

New models of pipe and pipeless furnaces, with a heightened fire pot designed for burning Alberta coal, were to be seen in the exhibit of the Galt Stove and Furnace Co. Ltd., Galt, Ont. In their stove exhibit an innovation was seen in the planished tops on practically all cookstoves, while in the gas stove section, it was noted that all these stoves are now fitted with the automatic lighter.

Rotating Panels Attract Attention

A display of lead pipe, 12 in. in diameter, one on the largest sizes made in Canada, was to be seen in the booth of the Canada Metal Co. Ltd., Toronto, Ont., who also showed their process of making ordinary lead pipe. Another innovation in the country featured in the same exhibit, was the stringing of ten blocks of lead on a wire for shipping, an idea that is proving popular. Laundry tubs and closet tanks manufactured by the firm were among the products shown. At one end of the booth a rotating set of panels carried a varied display of solders, babbitt metals and other small lines. Both Mr. Harris, president of the company, and his son, were in almost constant attendance in the booth during the course of the Exhibition, along with a large staff.

Large Heating Goods Display

Eight lines of furnaces and about as many of stoves were to be seen in the long, well-arranged booth of Clare Bros. and Co., Preston, Ont., where a staff composed of J. D. Aitchison, L. Lohead, W. Baker and B. Davey were on hand to answer enquiries.

Showed Cellar Drainer

A silent salesman in the one corner of the booth of the Jas. Morrison Brass Mfg. Co., Ltd., Toronto, Ont., contained a display of nickel finish taps and drinking fountain tops. A long table carried the valve display in bronze and iron body up to 12 inches in size, also featuring the reducing valves and heavy pressure valves. On the wall steam gauges and recording gauges were shown while at one end of the booth two gas water heaters in operation with running hot water and an automatic cellar drainer were shown. The exhibit was in charge of A. Betton, assisted by R. Graham.

Large Assortment of Valves

Water pressure systems were featured in the large, attractive exhibit of the Empire Brass Co. Ltd., London, Ont., in Machinery Hall, being shown fitted up to basins and complete bathroom sets. Globe, gate and curb valves were also shown in wide assortment in table displays. The exhibit was in charge of B. Morris, of the sales department.

Pumps Shown in Operation

Two pumps, to which were attached miniature tanks, drew much attention to a table in the front of the booth of the National Equipment Co., Toronto. The two pumps on the table were shown in operation. The rear of the booth was taken up by a number of pumps and tanks not in operation. The exhibit was in charge of M. J. Quinn, general manager, assisted by Ross Belyea.

Occupied Two Booths

The large exhibit of the McClary Mfg. Co. Ltd., London, Ont., showed gas ranges in plain and enamel finished oil stoves. At one corner of the exhibit a large range of enamel kitchen wares in grey, blue and white finishes were displayed on a tiered wire rack. A second booth, alongside this one, showed three furnaces, all set up. One of these was without casing so that the parts could be seen more easily.

Attractively Arranged Booth

An attractively arranged corner booth in the Industrial Building showed table displays of the line of compression goods manufactured by the Galt Brass Co., Galt, Ont. The remainder of the booth was given over to the showing of closet sets and washstands in white vitreous finish, the decorative idea of the booth working in well with the vitreous goods.

Photo Demonstrated Feature

Inventions Ltd., Montreal, P. Q., featured Rawlplugs, a simple device for enabling screws to be given a better purchase in such materials as glass, tile, wood, plaster, cement, metal, slate or stone. A photo showing ten men with a combined weight of 1,540 pounds hanging from a 9-32 inch screw and No. 14 Rawlplug in cement proved of much interest to passersby. The booth was in charge of H. Driver, managing director of the firm, assisted by D. M. Fraser, manager of the Dominion Engineering Agency, Ontario representatives for Inventions Ltd.

Many Visited Tent

A large tent carried the exhibit of T. G. Griffith and Co., Toronto, Ont., which was in charge of Mr. Griffith personally. Chemical toilets, septic tanks and water systems were shown, five pumps being shown in operation.

Twenty Years — Ago —

Following items are reproduced from MacLean Publishing Co., trade newspaper files of September, 1903:

"F. C. Hunt, London, Ont., has contracts for the Military School, C. McHugh, George Lewis, Bank at Lucan, Methodist church, Brantford, W. Wilson."

"Pease Furnace Co. of Toronto have found it necessary to increase both their plant and capitalization owing to the growth of business. The Sheridan Mfg. Co. of New Toronto has been merged with the Pease Co. and J. T. Sheridan becomes president of the reorganized firm."

"What promised to be an exciting game of baseball took place at the Woodbine, Toronto, last Saturday between the manufacturers and supply men and Toronto Master Plumbers' Association. The manufacturers won by the score of 26 to 18. Following were the players: Manufacturers; P. McMichael, A. Fleming, C. World, F. N. Cullen, W. Cluff, W. L. Helliwell, H. Carrick, Pearsall, Meen and Ormiston. Master Plumbers; W. Mansell, George Clapperton, George Cooper, R. Harrison, R. T. Robinson, C. Robertson, C. E. Pickard, L. Le Grow and W. G. D. Adams. At the conclusion P. McMichael, star pitcher of the manufacturers, was presented with a handsome bouquet and medal."

"Upwards of 300 persons representing the Master Plumbers and their wives and families of both Toronto and Hamilton, gathered at Oakville on Wednesday. Representing the Toronto supply houses were; A. A. McMichael of Jas. Robertson Co., Ltd.; H. W. Anthes, Toronto Foundry Co.; P. McMichael, Dominion Radiator Co.; F. Sommerville, Ontario Lead & Wire Co.; F. N. Cullen of Cullen & Jackson; A. Fleming of Stevens Mfg. Co.; W. Terry of F. W. Webb Co.; A. McArthur of Standard Ideal Sanitary Co.; C. World of Jas. Morrison Brass Mfg. Co. From Hamilton were Ald. Hugh S. Wallace of J. Wallace & Son; S. Mellow, W. J. Smith and A. Rogers. The plumbers beat the supplymen at baseball, 34 to 14."

Catalogs and Booklets

Those interested in any of the catalogs described below can procure a copy of the same by writing direct to these firms. Mention that you noticed this in *Sanitary Engineer*.

NEW ALUMINUM HANDBOOK

The British Aluminum Co., Ltd., of London, Eng., and 592 King St. West, Toronto, have issued a new volume called *The Aluminum Handbook*. This book contains sixty-four pages of useful information, which is printed on fine quality of paper and is attractively bound in green imitation leather.

The reading matter contained in this book is composed of many very useful facts and figures along every line of commercial aluminum, and should be of great assistance to the worker in aluminum.

The volume is divided into seven parts which are under the following headings: General, Tubes, Wire-Cable, Bars-Rods, Mouldings, Sheets, Ingots-Alloys.

It is mentioned in the introduction of this book that this company have printed treatises (in addition to this book) on "Casting Aluminum," "Sheet Metal Work," "Automobile Body Work," "Mouldings," and many others and that any of these will be mailed on request.

STEALTH

Father—How is it that I discover you kissing my daughter?

Young Man—I don't know, sir, unless it's because you wear rubber heels.—S.E.

DREW THE LINE

"See here, waiter, here's a piece of wood in my sausage," said a guest in a chop-house.

"Yes, sir, but I'm sure — er —"

"Sure, nothing! I don't mind eating the dog, but I'm hanged if I'm going to eat the kennel, too," interrupted the guest.—S.E.

New Goods of Interest to Plumbers

SOLDERING AND BRANDING TORCH

A new gasoline torch combined with a branding tool or soldering copper is made by the Geo. W. Diener Mfg. Co., Chicago, manufacturers of the Torrid line of blow torches.

The Torrid burner construction is new. A superheating chamber extends three-fourths the length of the upper side of the burner. The fuel is first vaporized by a generator similar to the type used in all blow torches. The vapor is then fed into the superheating chamber through a pre-heating tube inside the superheating chamber and is trans-

formed into dry gas. By this means the usual carbonization, which clogs the ordinary run of burners, is practically nil. The air-mixing principle is similar to that successfully used in "Torrid" torches. The superheated gas is discharged into the burner tube through the correct size opening for ordinary market gasoline, and is regulated by a needle valve. The needle is made in one piece of solid steel rod and seated squarely on a broad base of the solid casting. No separate inset, commonly known as a "needle block," is used in the manufacture of these burners, and there are said to be no parts to work loose in the stress of temperature variations to which a burner is subjected. The orifice is self-cleaning and guarded by a deep shoulder that overcomes the common difficulty and danger of forcing the needle when hot and enlarging the orifice.

PASSING THE BUCK

"Sir," said the young man, with enthusiasm, as he seized the lecturer's hand and shook it warmly, "I certainly enjoyed your lecture last night very much indeed."

"I am glad to hear that," said the lecturer, "but I didn't see you there."

"No," admitted the youth, "I wasn't there."

"But," said the puzzled speaker, "how could you enjoy my lecture if you were not present?"

"Oh, I bought tickets for my girl's parents and they both went."—S.E.

A SCOT'S NATURAL DEATH

The difference between an Englishman and a Scotchman has been described as follows: An Englishman loves telling a story about some other fellow, and a Scotsman loves telling a story about himself. It is not surprising, therefore, to find Sir Auckland Geddes relating an incident in which one of his own countrymen figures as the somewhat doubtful hero.

A Scotsman in the Strand saw a passer-by drop half-a-crown. He dived into the traffic after it, was run over, and killed.

The coroner returned a verdict of "Death from natural causes."—S. E.

The flame has a remarkable range of temperature adjustment. It burns steadily at any variation from a minimum of 1,400 degrees to a maximum of 2,000 degrees Fahr., which permits the various sizes of brands or soldering coppers to be held at the precise heat necessary for the work in hand.

TILE AND PORCELAIN CLEANER

The Hercules Chemical Co., 440 Washington St., New York, have placed on the market a new product, under the name of Hercules Tile and Porcelain Cleaner. This product is a sister product to the Hercules drain pipe solvent, which is already known on the market.

The manufacturers claim that this new article is an A1 high-grade product at a popular price, and that the established demand on the part of the consumer for a good porcelain cleaner

will mean good business for the merchant plumber, in profitable resales.

The label of this new product (which cannot be reproduced faithfully in the cut) makes a striking display.

The manufacturers claim that their policy of selling their products only to the plumbing trade eliminates any unfair competition from other sources, and that they will furnish further information on this new product upon application.

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

AN INCREASE in trading has taken place during the past two weeks, and plumbers, steamfitters, and sanitary engineers are reported to have large amounts of work lined up for the Fall months, this work being mostly in the nature of repairs to, or installations of new heating plants, in both residential and commercial buildings.

The decline in price on brass valves and bibbs is announced in Montreal and Winnipeg, as well as a reduction in prices of scrap materials which also occurred in Montreal. Towel bars and other lines of nickel plated bathroom fittings have advanced quite noticeably and declines of a slight nature in English galvanized sheets and coke tinplates have taken place in Toronto.

Montreal Markets

MONTREAL, Sept. 13.—Local dealers report an improvement in business during the past two weeks, and a general feeling exists that the fall trade is going to be good. Prices which have been in effect for some little time back have been maintained almost without exception during the past two weeks. Declines have occurred in some lines of compression goods.

The scrap market is quiet at the recent reductions, but considerable improvement is looked for in the very near future.

DECLINES NOTED IN SOME LINES OF COMPRESSION GOODS

Montreal.

A decline is noted in some lines of compression goods. Sales in this line are reported as being quite good at the present time. Quotations in effect locally are as follows:

VALVES AND BIBBS—

Compression work, standard.....	48%
Fuller work, standard	30%
Quick opening, compression bibbs.....	45%
Bath cocks, quick opening.....	38%
Bath cocks, compression.....	45%
Basin cocks, quick opening.....	50%
Flatway stop and waste cocks, std.....	56%
Roundway stop and waste cocks, std.....	42%
Brass steam cocks, standard, 1/4 in.....	25%
Radiator valves, standard	55/25%
Do., removable discs	55/25%
Globe, angle and check valves, std.....	25%
Gate or straightway	25%
Emco globe valves	33%
Emco check valves	33%
Jenkins globe, angle, check and swing check	plus 15%
Jenkins gate or straightway	plus 11%
Jenkins iron body, globe and angle.....	plus 10%
Jenkins iron body, gate.....	12%
N. P. "O" and "S" traps.....	34%

CORRUGATED SHEETS SELLING IN GOOD QUANTITIES

Montreal.

Prices on corrugated sheets remain unchanged. Dealers locally report a fair amount of activity in this line. Prices in effect locally are as follows:

CORRUGATED SHEETS—	Per 100 sq. ft.
No. 28 gauge	7 00
No. 26 gauge	7 50
No. 24 gauge	10 00
No. 22 gauge	12 50
No. 20 gauge	14 00
No. 18 gauge	19 00
Less 10 per cent.	
Lighter than 24 gauge and wider than 27 ins.	
75 cents per square extra.	

GOOD SALES IN EAVESTROUGH AND CONDUCTOR PIPE

Montreal.

Sales of eavestrough and conductor pipe are reported as improving. Prices remain steady and are quoted locally as follows:

EAVESTROUGH—

O. G. round and half round, per 100 ft. 8 in., \$16.90; 10 in., \$18.70; 12 in., \$22.20; 15 in., \$35.50; 18 in., \$45.00.

O. G. Square bead, per 100 ft.; 8 in., \$15.90; 10 in., \$17.70; 12 in., \$21.20; 15 in., \$34.50; 18 in., \$44.00.

Discount 65 and 5 per cent.

CONDUCTOR PIPE—Round, Plain and Corrugated, per 100 ft.; 2 in., \$18.40; 3 in., \$22.30; 4 in., \$29.60; 6 in., \$48.00; 8 in., \$58.80.

Discount 65 and 5 per cent.

CONDUCTOR ELBOWS—

Plain or corrugated, price per doz. 2 in., \$5.25; 3 in., \$6.00; 4 in., \$10.50; 5 in., \$24.00; 6 in., \$29.00.

Discount 50 and 10 per cent.

WEEK'S MARKET QUIET IN SCRAP MATERIALS

Montreal.

A very quiet market is reported by dealers in scrap materials. Few sales are being made, but dealers are looking for considerable improvement in the near future.

SCRAP—

Automobile Tires	0 50
Rubber Shoes.....	0 02
Yellow brass	0 06 1/2
Red brass	0 06 3/4
Light brass	0 04 1/2
Scrap zinc	0 05
Lead, heavy	0 05
Lead, tea	0 03
Light copper	0 09 1/2
Heavy copper	0 11 3/4

Discount Standard, 35 per cent.; Extra heavy, 25 per cent.	

Interest Again Aroused In Combine Legislation

INTEREST has once more been aroused in Bill No. 54, commonly known as the Combines Act, because of the recent announcement that the Minister of Labor had been charged with the general administration of the Act. The title and subject matter of this bill is such that it has always attracted public attention whenever it has been mentioned, because it deals with a subject that has, perhaps, been used more for all sorts of political purposes during the past fifty years, both in Canada and the United States, than any other public question.

Under this new Act, the professional classes, such as lawyers, who have their fees fixed by law, and doctors, who agree among themselves, as well as other professional and laboring classes, are exempt from its operations, but manufacturers and all classes of retail distributors, insurance and transportation companies, come under its operation.

A COMBINATION OF KITCHEN SINK AND LAUNDRY TUB. AN IDEAL FIXTURE FOR A SMALL HOUSE OR APARTMENT

SELL THE FIXTURES YOUR CUSTOMERS WANT

This combination of kitchen sink and laundry tub, for bungalows as well as for apartments, will win the instant favor of any housewife. Convenient as any kitchen sink of adjustable height, it is readily converted to a laundry tub. The

sink is always in service—only the drain board need be removed on wash day. Made of stainless enamel with faucets and connections of rust-proof brass. Build a bigger business by selling the exact equipment your customers want.

"Triumph" self-closing faucet, ball bearing

Toronto Markets

TORONTO, Sept. 13.—Business conditions locally are improved over those existing two weeks ago, and reports on sales are most encouraging. The outlook as regards trade during the coming fall is also very encouraging, and all jobbing houses are carrying ample stocks in readiness for the brisk trade which is expected, and which in some cases has already been felt.

A substantial advance in price has been made on towel bars, soap holders, and other lines of nickel-plated bathroom fittings during the past two weeks, while a slight decline has occurred in coke tin-plates amounting to fifty cents per box. English galvanized sheets declined also from twenty-five to fifty cents per hundred pounds.

BIG ADVANCE IN PRICES OF BATHROOM FITTINGS

Toronto.

Due to increases in the cost of production, some lines of bathroom fixtures have been advanced in price to quite a noticeable degree.

The following lines have been advanced from 25 per cent. to 50 per cent., and, in some cases, even more, over the prices issued Aug. 21, 1922.

The new price list, which is dated Aug. 14, 1923, is now obtainable from the manufacturer. A few of the new prices are given herewith:

NEW BAR EXTRAS LIST OBTAINABLE

Toronto.

The new list of bar extras on iron and steel, which is applicable to the dealer trade, has just been received off the

press by manufacturers and jobbers of bar iron and steel.

This list is called the "R" list and is dated effective Sept. 1, and takes the place of the old "D" list, which is now cancelled. There has been some delay in publishing these lists, but same may now be obtained from jobbers or manufacturers of steel and iron bars.

Base prices have not been changed recently. Steel bars are still selling at \$3.75 to \$3.90 per 100 lbs. base. Other prices now in effect are as follows:

IRON AND STEEL—		Per cwt.	
Bars, steel.....base	3 75	3 90

PIG IRON PRICE STEADY AT \$33.30

Toronto.

No change has occurred in the prices on pig iron. Some consumers of this material are of the opinion that lower prices will be experienced on pig iron in the near future, but up to the present no changes have occurred.

The eight-hour day being put into force in all large mills, has not had the effect of boosting prices, as was expected by the majority of the distributors.

PIG IRON—(Price per ton)—

Service is built into every Jenkins Valve!

Fig. 106
Jenkins Bronze Globe
Valve.

In every respect every Jenkins Valve of any type is designed, built, tested and guaranteed for the severest service in the use for which it is recommended.

The "Diamond Mark" on the body is an assurance of dependable service—of a valve that will stand up under the strain of usage that would create trouble with anything less dependable than a genuine "Jenkins."

Years of experience in valve manufacturing contribute to the perfection of Jenkins Design. Close inspection and rigid factory tests assure the dependability that never fails.

You should have a copy of Jenkins Catalog No. 9. It describes the entire line of Diamond Marked Valves in detail. It will be mailed free on request.

No. 20 gauge	14 00
No. 18 gauge	19 00

Less 10 per cent.

Lighter than 24 gauge and wider than 27 ins., 75 cents per square extra.

SOIL PIPE PRICES ARE FIRM AT FORMER LEVELS

Toronto.

Good quantities of soil pipe and soil pipe fittings have been sold this month, and prospects are good for a large fall trade.

Prices are same as issued in Sanitary Engineer of Sept. 1. No charges having occurred in the discounts from the regular list, the prevailing discounts are as follows:

SOIL PIPE AND FITTINGS—

2 inch	Less 20%
3 inch	Less 20%
4 inch	Less 25%
5 and 6 inch	Less 20%
8 inch	net

FITTINGS—

8 inch fittings	net.
2 to 6 inch	Less 37 1/2%

TRADING SEASONABLY GOOD IN EAVESTROUGH LINES

Toronto

Standard O. G. trough and round conductor pipe have been selling in good volume during the last two weeks.

The prices on these lines have not undergone any changes of late, the discount on the trough lines still being 65 and 5 per cent. off list, this discount also being applicable to list prices on conductor pipe, while the prevailing discount on outlets, cut-offs, tubes, elbows, and conductor hooks, is 50 and 10 per cent. off.

Sell Better Heating for Better Homes —It Pays—

"New King" selling points are easily understood; they "get across" because "New King" boiler construction is extremely simple. In a few words you are able to show clearly and graphically **why** "New King" gives even, generous heat on the coldest days.

Notice how perfect circulation is guaranteed at all times by the TWO WAY NIPPLE CONSTRUCTION. The "New King" firepot is made ENTIRELY INDEPENDENT OF THE FIRST SECTION, resulting in easier erection and less costly replacements in the event of accident.

These two details, simple though they are, give the householder what he desires above everything else—BETTER HEAT. Too, they give "King Boilers" a distinction which makes it worth your while to recommend and sell "King Boiler" Heating Systems.

Instal IMPERIAL RADIATORS with "King Boilers." They add, by their gracefulness, a touch of beauty to any home; their rugged construction and large radiating surfaces assure years of perfect heating satisfaction.

Write for Catalogue and Prices to-day.

LOCAL PRICES STEADY ON INGOT METALS

Toronto.

Prices have not been changed on ingot metals, in the local markets, during the past two weeks.

Trading has been rather spasmodic in most metals, and prices in primary mar-

kets are inclined to be more active of late, though no changes have been made to the extent of fluctuating local prices. Quotations in force now are as follows: INGOT METALS—

Copper \$18.00 to \$19.00; Tin \$45.00 to \$46.00; Lead \$8.00 to \$8.25; Spelter \$9.00; Antimony, \$8.25 to \$8.50; Aluminum, \$23.00 to 25.00.

BRISK TRADE IN FURNACES, RADIATORS AND BOILERS

Toronto.

Heating firms report that during the year the heating business has been very good, a steady trade having been maintained in furnaces all year, with the exception of about six weeks in the summer, when trading was quieter in this line.

Dealers in boilers and radiators at present are exceptionally busy, and the heating business in general is in a very

healthy condition. Prices, as quoted herewith, have not been changed for some time past.

RADIATORS AND BOILERS—

Revised radiator list prices are for 1, 2, 3, 4 and 5-column radiators per square foot.
38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60.

Discount on 2, 3, 4 and 5 column standard sizes, 44 per cent. for water and 45 per cent. for steam.

Discount on 1-column standard size, and 2, 3, and 4-column hospital sizes 36 per cent. for water and 37 per cent. for steam.

Discounts on 1 column hospital size water 22 per cent. Steam 23 per cent.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05. Discount 41 per cent.

BOILERS—

Water:

Round 52 per cent. off list. Square 8 per cent. off list.

Steam:

Round, 13 per cent. off list; Square, list plus 7 per cent.

Winnipeg, Man.

WINNIPEG, Sept. 13.—Dealers locally report fair sale for steam-fitting and plumbers' lines. Fusible plugs have moved upward while brass valves show a revision in discounts. Prices on the whole have a tendency to remain steady at present levels.

Eavestrough and conductor pipe are having fairly good sales. Soil pipe and corrugated sheets continue steady. Trading in closet goods is seasonable and an improvement is expected. Lead and zinc goods continue to rule steady.

SALE OF COMPRESSION GOODS SEASONABLE

Winnipeg.

A seasonable business is reported by dealers locally for compression goods. There has been a revision in discounts on standard brass valves of the globe and angle variety and discounts are list price less 20 per cent.

FUSIBLE PLUGS MOVE UPWARD

Winnipeg.

Fusible plugs of the Alberta pattern are quoted at higher levels. Size ½ inch is quoted at 90 cents each, ¾ inch at \$1 and 1 inch at \$1.35.

LEAD AND ZINC GOODS STEADY

Winnipeg.

Lead and zinc prices show no change. Lead on primary markets shows a slight advance and a revision in the price of lead goods is likely to take place in the near future.

PRICES ON WROUGHT PIPE UNCHANGED

Winnipeg.

No change is noted in the price of wrought pipe. Prices are still being based on price list issued a short while ago.

RADIATORS AND BOILER PRICES ARE STEADY

Winnipeg.

No change is reported in the price of radiators or boilers. With building activity quiet the demand for these goods has fallen off.

NO CHANGE IN SOIL PIPE PRICES

Winnipeg.

A steady tone prevails to the soil pipe market and dealers report sales seasonable for this line.

CORRUGATED SHEETS CONTINUE STEADY

Winnipeg.

Prices on corrugated sheets continue steady and dealers locally report a fair amount of business passing.

TRADING IN CLOSET GOODS QUIET

Winnipeg.

Prices on closet goods on the local market remain steady. Trading is quiet at the present time but dealers are looking forward to an improvement.

STEADY TONE TO SHEETS AND PLATES

Winnipeg.

Prices of sheets and plates remain steady and show no tendency to deviate from present prices.

EAVESTROUGH AND CONDUCTOR PIPE REMAIN FIRM

Winnipeg.

Dealers report the demand for eavestrough and conductor pipe as somewhat quiet at the present time and as the season advances they are looking forward to an improvement.

PIPE FITTINGS SHOW NO CHANGE

Winnipeg.

There is no change in quotations on pipe fittings. Dealers report steady sales in these lines.

Banner Furnaces Sell Quicker This Way

The Banner Furnace

YOUR heating prospect demands just one thing from his furnace—abundant heat throughout the long, bleak winter months.

Emphasis on the **PROVEN** heating qualities of the Banner Furnace rather than its fine mechanical features will bring quicker results.

Each type of Banner Furnace has its definite sphere of usefulness. Any home, no matter the size, can be quickly, healthfully heated with the Banner Pipe or Pipeless.

Every owner of a Banner Furnace is assured of a sturdy, long-lived heating plant that will give years of splendid heating comfort.

Every furnace prospect on your list is a potential "Banner" owner. Persistence, a graphic explanation of Banner's better heating features and the booklet of Banner testimonials will make many furnace sales.

We will gladly supply you with further information, literature, etc.

THE GALT STOVE & FURNACE CO., LTD.
GALT - ONTARIO

A PIECE OF TABLE-WARE

may be solid silver without the "sterling" stamp, the accepted "Hall Mark" of quality.

But you don't know.

A Bank might be honest and efficient without Government inspection.

But you don't know.

A business concern may be absolutely responsible without a commercial rating.

But you don't know.

A publication may have the circulation it claims without verification by the Audit Bureau of Circulations.

But you don't know.

Better be sure.

The circulation of Sanitary Engineer, Plumber and Steamfitter of Canada is verified by the A.B.C. Sanitary Engineer, Plumber and Steamfitter of Canada is the only Plumbers' Journal in Canada that will supply an A.B.C. Audit.

Any Plumber can interest a hot-water- heat user in a Mueller Auto- matic System of Hot Water Heat Control

THE automatic feature of this System, alone, is a powerful selling argument. Once connected up and placed in operation the System requires no further attention—the water is supplied automatically—the relief is automatic as well as the damper regulations. The householder keeps up the fires—the System does the rest. And here are a dozen other talking points.

1. The Mueller System requires no unsightly expansion tank, eliminating danger of freezing or overflow.
2. Can be installed in less than an hour on either old or new systems.
3. Maintains fresh water in system at all times.
4. Keeps System clean because of the rapid circulation due to pressure and fresh water.
5. Automatic damper control saves fuel.
6. Perfectly safe—impossible to have too high or too low pressure in the Mueller System.
7. The Reducing Valve and Relief Valve are positive in action, opening and working freely even after long periods of inactivity.
8. The water does not boil nearly so quickly as in the old type open systems with sluggish water.
9. Reducing Valve closes when the System is filled and the pressure reaches 10 pounds.
10. When the pressure reaches 25 pounds the Relief Valve operates allowing a small amount of water to pass from the system.
11. Both of the above operations are automatic and take place without the attention or knowledge of the owner.
12. Being Mueller Made, the System is thoroughly dependable—an absolute insurance of satisfaction to you and your customer.

Like a Right-hand Man!

You can't be without Rawlplugs if you want quick, permanent attachments!

For attaching plumbing, fixtures, or any other job that needs screws, Rawlplugs are best and most economical.

Leading Contractors and Engineers use them because they hold equally well in Brick, Plaster, Hollow Tile, Marble, Slate, Concrete or Cement and because they never rot through dampness. Rawlplugs save time, assure a job that will last indefinitely and reflect credit on your work. We will be pleased to send you samples of this fibre screw anchor and our list price—upon receipt of your letter. Write *immediately*.

FIX IT WITH

THE Royal

Automatic Gas Water Heaters

The word "Service" does not mean a thing to the plumber who installs a Royal Heater.

Once this compact heater and storage tank is erected, it will carry on for years without any call for your services to adjust or repair it.

The Royal Automatic Gas Water Heater and Boiler combined gives the kind of satisfaction that prevents complaints, makes friends, builds business and puts money in the bank.

Sold only through or by plumbers.

Write for full information.

PNEUMATIC WATER SUPPLY SYSTEM

Gives country residents all the advantages of a city water system without the excessive cost

The wide-awake dealer will make big profits out of this system among customers who now have difficulty with their water supply. It is so simple to operate and costs practically nothing for upkeep.

The outfit consists of an air-tight steel tank which can be placed in the basement, and a "Myers" famous guaranteed pump (hand or power), suitable for pumping air or water, together with pipes and fittings.

Any plumber or gas fitter can easily install it. Every outfit guaranteed to do the work for which it is designed. For small or large dwellings.

Write us for Water System Catalogue and prices. Now is the time to interest your customers.

Burnham Boilers

This square shouldered, broad chested Twin is about 71 inches wide and but slightly over 80 inches high.

Let The Lie Lie

If a thing isn't so, and you find it out, and go right on letting folks believe it's so, is that a lie?

If it is, then we are letting the lie lie, by not changing the ratings on the Burnham Twin Sectional Boiler.

The ratings are now altogether too low, according to the work the boiler did over and over again during last winter's severest of tests.

But we are not going to jack up the ratings. We prefer to have it do more than we claim it will do.

Gurney Reputation is Something You Can Sell

As a practical heating engineer, you know that people are demanding proven heating systems. Antiquated "coal eaters" have wearied a lot of furnace owners by their wastefulness and drudgery. You've got to show performance for the make of Boiler you recommend.

You know just as well that Gurney Hot Water and Steam Boilers have a long-established reputation for reliability, efficiency, economy and easy operation. You can bank on that reputation, built up by three generations of Gurneys.

No other heating system made on this continent can show fewer repairs than a Gurney. That's a fact you can prove to any boiler prospect.

In specifying Gurney Heating you are guaranteeing satisfaction to the user and adding to your prestige as a heating engineer. And, of course, we stand four square behind your recommendation of Gurney Boilers and Radiators.

Yours sincerely,

Holt Gurney

P.S.—Why not write, and see if we've some suggestions for you? There are lots of replacement jobs to be had this Fall.

Gurney

Gurney Furnaces for Steam, Hot Water and Warm Air
—Gurney Stoves for Electricity, Gas, Coal and Wood
are good products worthy of the Gurney name.

Is this special border familiar to you? A consumer advertisement in our National Campaign told, within this very border, how a Gurney Hot Water System paid \$43 annual dividends in saved coal. And it advertised you in these words: "The steamfitters who install our furnaces are at your service to give you advice and estimates of the cost of installing Gurney Hot Water or Hot Air Furnaces in old or new houses." Why not benefit from this Gurney advertising?

The test of time has proved Gurney Heating to be efficient, economical, elastic. There's a "Gurney" system that will solve every heating problem with credit to the engineer who installs it.

Have you the latest literature on Gurney Boilers and Radiators? Let us have your request to-day.

Better in Every Way

Made in Galt by the manufacturers of Teck Flush Valves, Perfecto Brass Goods and Vitro Tanks.

Our New Quick Opening Radiator Valve

SANITARY Engineers! Just look over the following description of this new valve that opens and closes at one twist.

Shoulders on each connection prevent pipe from interfering with the barrel.

Body is threaded on the OUTSIDE.

Bonnet tightens down on a fibre gasket insuring a tight connection.

Cushion packing nut which is easily repacked.

Made of best quality metal mixture.

Parts are machined to gauge and are interchangeable.

Broached handle with curved top that holds no dust.

Neat in appearance. Carries the same "Two-for-One" guarantee as the famous Perfecto Brass Goods.

The New EMCO Concealed Fixture for Tiled-in Baths

has valves of by-pass construction permitting connections from above or below, or allowing for shower connections if required. The handles and escutcheons are porcelain, the spout is of generous design, giving the exposed part of the fixture a handsome appearance. The EMCO concealed bath room fixture is very simple to install. There is enough adjustment in its construction to take care of ordinary variations in the thickness of wall.

See your jobber or write us regarding the
new "EMCO" concealed bathroom fitting.

Compression Stop and Waste

This special design Automatic Compression Stop and Waste is unequalled for simplicity, efficiency, and durability.

The Waste opening is in the adjustable hood which can be set in any position permitting Stop to waste from either side and at any angle.

No. 3483— $\frac{1}{2}$ and $\frac{3}{4}$ Sizes.

Automatic in action—no caps to remove—but wastes automatically with the closing of the Stop.

The waste does not begin until the stop is shut off.

All parts are standardized and interchangeable assuring ready repairs in event of mishap.

This easily operated Compression Stop and Waste is being very generally installed replacing the Ground Key style which becomes impractical in use owing to the keys setting tight.

Your Own Salesmanship Is Not Enough

The testimony of satisfied owners—owners of boilers and radiators that you have installed, is necessary to the up-building of a successful heating business.

The average Canadian wants, and demands from his heating plant adequate heat—and wants it at a minimum of trouble and of fuel consumption.

Daisy Boilers and Viking Radiators always, unfailingly, give just this service; they build good will for the dealer; they enhance his reputation; they are his surest salesmen.

Fall Home-Builders are alive to the necessity for reliable heating systems. Estimates are being furnished and plans being made—now. Your golden opportunity is at hand to recommend, sell, and instal “Daisy Boilers” and “Viking Radiators.” We are ready to go over specifications with you.

The Joys of a Built-in Bath-tub

HAVE you exploited fully the joys of a built-in bath-tub? Do you tell customers of its beauty of appearance? That it occupies less space? That it is more sanitary? That dirt cannot collect below or behind it.

The "Standard" built-in bath-tub is as big an advance in comfort over the four legged bath-tub, as the comfortable chesterfield is over the old horse-hair sofa.

Built in bath-tubs, pedestal lavatories, and other up-to-date plumbing fixtures are being exploited in a powerful and effective manner by the "Standard" advertising campaign now appearing in a select list of Canada's Magazines and newspapers.

Heating Features Every Householder Understands

With one eye on the coal bin and the other on the ever mounting price of coal, your prospect for a New King heating system wants to know two things:

First:—Will it give me adequate, even heating at all times?

Second:—Is it economical of fuel?

The answer to both questions is an emphatic YES.

The following features of design and construction assure the maximum of heating comfort at a minimum expenditure of fuel.

Perfect circulation guaranteed at all times by the TWO WAY NIPPLE construction. Fire pot made entirely independent of the first section. New King Smoke Control. Improved grate operation.

When you sell a New King Boiler you sell more than just a furnace; you sell years of cosy winter comfort and uninterrupted satisfaction.

Install IMPERIAL RADIATORS with a King Boiler—they look better, last longer and radiate the heat.

Catalogue for the asking.

—But it doesn't mean anything

*The Anthes Syphon
"The Heart of
the Disposal System"*

Rarely will you find a farmer who will admit he is making money; it was ever thus.

"Crops are poor"; "Prices are low"; "Times are hard"—so runs his plaint year in year out—but it doesn't mean anything.

To-day the Canadian Farmer is sitting pretty. Despite vigorous denials he has money to spend to better his living conditions.

It is your privilege, Mr. Sanitary Engineer, to pry him loose from enough cash to pay for a complete indoor lavatory equipment.

He owes it to his women folk, to himself and to the community to banish the outdoor privy into the limbo of discarded, outworn things along with the rack, the thumbscrew, earmuffs, and red flannel underwear.

Jobbers' Cost Laid Bare Under the New Sales Tax Regulations

Unlicensed Jobbers Selling to Licensed Jobbers or Manufacturers Must Show Amount of Sales Tax Paid on Their Purchases at Six Per Cent.—Jobbers Take Advantage of Opportunity to Put in Stock by Dec. 31—Various Plans of Quoting Used by Manufacturers

WITH only a tentative outline of the new Sales Tax regulations to work on, manufacturers, wholesalers and plumbers throughout the country are giving much attention to the likely effect upon their branches of trade of the new basis on which the six per cent. tax will be applied after January 1, 1924. In some districts the trade have been gathering together to discuss the subject and make recommendations to Ottawa before the final regulations are framed; but in others the matter has received little attention and Sanitary Engineer has been requested to provide some details of the controversial points arising in the various discussions.

From a general review of the regulations it is evident that the new tax of 6 per cent., being an increase from the present $4\frac{1}{2}$ per cent. tax, is to be collected by the government at the source after January 1, 1924. The source means from licensed manufacturers or licensed jobbers. Practically every manufacturer will be licensed and be compelled to hand over to the government 6 per cent. on the invoice value of goods as sold for consumption. The 6 per cent. is not to be included in the cost on which sales tax is figured. Thus, if a bill of goods for sale to a wholesaler or retailer is invoiced at \$100, the total as it is received by the buyer will be \$106. Were the manufacturer to absorb the 6 per cent. in his cost he would charge 6 per cent. on \$106. Licensed jobbers on whose sales tax must also be returned to the government, include those jobbers who sell more than 50 per cent. of their total sales of goods to licensed manufacturers or producers, to be used in articles manufactured for sale.

No Tax on Raw Imports

After January 1 no sales tax will apply to a manufacturers' importation of raw material and a refund is to be granted of the $4\frac{1}{2}$ per cent. sales tax paid before that date on all material on hand on that date, notice being given in writing on December 1 and an inventory to be submitted with claim before June 30, 1924. No deduction to be allowed in respect of goods not accounted for prior to March 31, 1924.

Under the new regulations the Sales Tax will be collected entirely at the source and not split up into two stages of collection as at present. The tax will therefore be more concealed than at present, and judging from efforts being made by manufacturers to take care of the increased tax, it is thought unlikely that it will cause as much confusion among jobbers and retailers as has formerly existed.

In view of the apparently more favorable buying conditions existing prior to January 1, when the increased sales tax becomes effective, it is felt that there will be a tendency for wholesalers and retailers to stock up between now and the end of December.

Jobbers Are Stocking

Questioned on this point wholesalers in Toronto pointed out that they were already taking steps along this line in respect to certain goods. On lines where there was long dating, such for instance as spring goods which would ordinarily be placed in warehouse about February and paid for about next April on terms prevailing at time of delivery, steps were being taken to secure delivery in December so that terms prevailing in that month would apply and thus save $1\frac{1}{2}$ per cent. sales tax.

That this practice could not be followed out to advantage in all lines was pointed out, however, on account of the terms which some manufacturers have made already on booked orders. Some manufacturers have revised prices already and lists carry the advice "these prices include Sales Tax." This complies with the regulations, and it is the intention that these prices exist for immediate business as well as for after the turn of the year. Requests made by certain jobbers for reduction in these prices to compensate for the lower sales tax now existing compared with that to apply after January 1, have been met with the response that these prices include sales tax, and the manufacturer is not saying what or how much sales tax they include. There is no way of knowing whether the manufacturer is absorbing any or all of it. This plan is much more desirable, according to jobbers, for the tax is absolutely concealed, but in such cases there is no incentive to secure delivery before Dec. 31. As a matter of fact there is advantage in postponing buying of such goods until after January 1, as at present these jobbers are compelled to pay a $2\frac{1}{4}$ per cent. tax in addition, which will not apply after January 1.

Retailers May Do Likewise

On the lines being quoted in such a way that there is an advantage to jobbers in buying before that time, it is pointed out that retailers might also buy to advantage. Unless the sales tax is included in the price being quoted for present and future business there is an advantage of $1\frac{1}{2}$ per cent. which will accrue to the wholesaler or retailer who has the goods by December 31, compared with the one who has to

buy thereafter. On the point of whether this advantage will be taken or not, wholesalers were non-committal.

It was not thought that the tying up of manufacturers' money in sales tax paid on raw materials on hand January 1, until rebate can be secured, would be sufficiently serious to warrant much slackening off of buying of materials during the latter part of the year. This opinion was based on the fact that most industries are busy at that time of year working on spring orders and that the present policy of buying materials only for current requirements would hardly be altered in a firm market with the consequent danger of having to pay higher prices, merely for the advantage of having the use of funds representing sales tax on materials on hand on January 1 for a couple of months.

One of the most interesting points raised in discussion of the regulations was that dealing with the responsibilities of an unlicensed jobber selling to a licensed jobber or manufacturer. Under such conditions the unlicensed jobber who sells the goods is compelled to show on his invoice the amount of sales tax which was paid on the goods when he bought them from a manufacturer originally. This is in order that the licensed manufacturer who subsequently buys the goods will be able to make application for rebate of that amount (the article carrying sales tax when again passed on to the consumer by him). Under this plan it is at once apparent that the exact cost to the unlicensed jobber and his profit margin are disclosed to the buyer. This is information which it is not always desirable should be passed on and some jobbers are much incensed over it. It sometimes happens that an unlicensed jobber in a district may sell some merchandise to a local licensed jobber with whom he is in competition and under this plan his cost, and therefore profit margin, is quite apparent, because the sales tax is paid on the cost of the goods to that unlicensed jobber, and he must pass on a notice of the amount of that tax on the invoice.

Jobbers affected by this regulation are putting forward the claim that they should secure the rebate of that sales tax when they in turn sell a licensed manufacturer or jobber.

Generally speaking, wholesalers are of the opinion that the plan of including the sales tax in the price quoted by the manufacturer or licensed jobber, will be much better for wholesalers and retailers. One wholesaler cites the fact that last year he was forced to pay \$12,000 out of the firm's profits for sales tax, which it was impossible to collect under the existing regulations. It is known that many manufacturers have been faced with the same problem. It is the opinion that on goods carrying established resale prices there will be more of a tendency for manufacturers to take care of some part of the sales tax in their quotations to the trade. The mar-

(Continued on page 17)

Outstanding Points of Sales Tax Discussions

1. Steps being taken by jobbers to stock up by Dec. 31 and to secure delivery of goods by that time which carry spring dating where goods do not carry a price which already includes sales tax.
2. In some cases manufacturers are already quoting prices which include sales tax and are effective now and after January 1. Buying is being curtailed on such lines now because jobbers have to pay the existing $2\frac{1}{4}$ per cent. tax which will be eliminated after January 1.
3. There will accrue to the wholesaler or plumbers with goods on hand on January 1 the advantage of $1\frac{1}{2}$ per cent. sales tax, being the difference between the present $4\frac{1}{2}$ and the new 6 per cent. tax. Whether this advantage will be taken by jobbers in sales to plumbers is questionable.
4. Manufacturers cannot get rebate for tax paid on materials on hand on January 1 for probably a month or two, but it is not thought that this tying up of capital will be serious enough to warrant any curtailment of raw material buying in December.
5. An unlicensed jobber selling to a licensed jobber or manufacturer has to show on his invoice the amount of sales tax he paid when he bought the goods. At 6 per cent. it is then simple for the buyer to figure that jobber's costs. These jobbers want to secure this rebate themselves and not give away this information.
6. It is thought much confusion will be eliminated and loss from necessary absorption of sales tax curtailed under the new regulations. Manufacturers of lines carrying established resale prices are said to have shown more inclination to make some allowance in discounts for the sales tax.
7. Some manufacturers object to concealment of tax in price quoted on ground that two prices would be necessary in selling to licensed or unlicensed jobbers respectively.

Manufacturer Shows Why Tax Concealment Would be Unsatisfactory

Claims Two Sets of Prices Necessary in Selling to Licensed and Unlicensed Wholesalers Would Cause Confusion and Dissatisfaction—Long Standing Lists and Discounts Would be Upset

DISCUSSING the proposal made by certain wholesale interests that manufacturers should conceal in their selling prices the new six per cent. sales tax, to come into effect on January 1, George Spence, sales manager of The Steel Co. of Canada, Ltd., Hamilton, Ont., stated to Sanitary Engineer, that from present indications this firm would continue to follow the policy which has been adhered to under the existing sales tax, viz., handling the sales tax as a separate item. Apart from the question of it facilitating matters to merely extend the present plan to cope with the six per cent. tax, and eliminating any necessity of interfering with existing lists and discounts on the various products manufactured, there are some other important considerations involved.

It was pointed out that were the firm to adjust prices so as to include the sales tax, that two sets of prices would be necessary in selling to wholesalers accordingly as they are licensed or unlicensed. Reference to the official copy of the Act concerning the new Sales Tax indicated that where a manufacturer sells to an unlicensed wholesaler that the tax is collected on that transaction, but in selling to a licensed wholesaler no sales tax applies until the merchandise passes on from the wholesaler. Thus it is quite evident a price including

the sales tax in one case would not do in the other case, and it is held much confusion would result, especially where long standing lists and discounts are in effect.

The fact that the tax is to be paid by the consumer and that pyramiding is largely eliminated under prevailing conditions, was thought to be sufficient indication that the tax can be taken care of without working any hardship on any branch of trade, by following out the present plan. With the idea of following this policy after January 1, orders being taken now for delivery after that date are being taken "subject to buyers' account," the increased sales tax to apply providing the regulations as finally drafted do not include any drastic changes.

Concerning the question of manufacturers hesitating to purchase stocks of raw material before January 1, so as not to have money tied up in sales tax for a couple of months before rebate is available, Mr. Spence stated that his company would probably take advantage of this situation to some extent, but that in their case this could not be done on a very large scale because the ore and coal which is largely handled during the shipping season is already in hand in sufficient quantity to last for some time.

Gasoline Stations Equipped With Sanitary Accommodation for Patrons

Question of Adoption of International Comfort Station Mark is Brought up in Toronto—American Stations Display Sign and Find Business is Increased as Consequence

THERE is a growing tendency on the part of municipalities all over the country to compel owners of gasoline filling and service stations to provide certain sanitary accommodations for their patrons, a movement that has taken root in the city of Toronto to an extent not yet fully realized by the average citizen.

Under civic regulations, no service station can be erected in the city at a cost less than \$10,000, and, according to the plans, approved by the city architect, must contain two water closets, one for the use of male patrons and one for female patrons.

Through an oversight in the preparation of the regulations, however, no provision was made at the time of their origin for the showing by the service station that such accommodation was to be found on their premises. Consequently, though all stations erected during the past two years are thus equipped, very few of them make the fact known to the public and as a result the existence of the sanitary accommodations has remained more or less of a dark secret and has been of no service to the motorists for whom the accommodation was originally intended.

It is claimed by the service station proprietors that were they to put up signs, indicating the presence of lavatories, the public would take that as a sign that the accommodation had been placed there for general use, making the maintenance of the services considerably higher than were the use confined to patrons of the stations as was the intent of the regulation. The service station proprietors do not feel that they should be called upon to provide accommodation for the general public at their own expense any more than the proprietors of any other business places.

However, the regulations stand, and to make them of some value by the achieving of the object originally intended, the civic authorities are again taking up the matter and it is expected that a ruling will be handed down shortly as to the placing of signs at the stations, indicating the presence of the sanitary accommodations.

It has been suggested that the city adopt the International Comfort Station mark, already so familiar to travellers in the United States. This mark consists a circle board of piece of metal on which an outer circle is painted in olive green and the inner circle white. On this inner circle is a four-pointed star of lemon yellow outlined in green, the whole presenting the appearance indicated in an accompanying illustration.

This mark is now attaining wide usage in the United States and its adoption in Canada, particularly in Toronto and those other parts where the American tourist traffic is heavy each summer, would serve a two-fold purpose. In the first place, the objection raised by the proprietors would be minimized. The mark bears no wording whatever, thus eliminating the idea of a public accommodation and is still a mark that would soon become familiar with motorists and result in a real benefit to the stations showing it. In the second place, its use would tend towards standardization and would prove as informative to visiting tourists as to resident patrons.

Whether this will be adopted in Toronto or not, has not been decided as yet. It may be that service station proprietors will be obliged to put up small notices. The International mark, however, is superior from every point of view and there is little doubt but what its adoption would be welcomed by all concerned.

Filling stations are more profitable when they display a public comfort station sign. The sign signals the traveler to stop and enjoy the use and comfort of modern, sanitary plumbing facilities. Once stopped, what more natural than to buy some "gas"!

Public comfort station equipment is a profitable investment in building good-will—quickly pays for itself in increased, friendly patronage.

Says Women Are Increasingly Important Buyers of Plumbing Supplies

Overcoming the Woman's Instinctive Dread of Dirty Plumbing Shops, the Modern Sanitary Engineer Must Have a Spotless Showroom With Clean, Attractive Goods on Display—The Home Owner Who Buys One Piece of Equipment at a Time

WINDOW displays put in at regular intervals and made as attractive as possible have been a most important factor in making the heating and plumbing department one of the most important sections of the store of H. Knell at Kitchener, Ont. Mr. Knell makes a special point of always including a generous showing of bathroom fixtures in every plumbing window that is dressed. There are two reasons for this, he says. One is that bathroom fixtures carry an unusually wide appeal. The other is, that the majority of the lines are so attractive, and so well finished, that they naturally enhance the display value of other lines of plumbing goods, and not only sell themselves, but help to sell other merchandise.

His Best Advertisement

"I am not exaggerating one bit when I say that our display windows are our very best advertising force," said Mr. Knell. "A window display of bathroom fixtures and plumbing goods brings immediate and very satisfactory results. The display besides producing immediate sales brings in many inquiries which later develop into good business."

Just here it might be mentioned that Kitchener is a factory city, having more factories per capita than any other city

in the Dominion. It stands third in the percentage of homes owned, approximately 80 per cent. of the men employed owning their own homes. Few cities have such a large percentage of really comfortable, well-built homes. A great many of the workers, with the thrift that is characteristic of the city, build a home and then proceed to instal modern heating and plumbing as they can afford it. This means that there is a constant demand for various lines of heating and plumbing goods, and by constantly keeping before the population these lines of merchandise Mr. Knell is enabled to cash in on some splendid and profitable business. He also in addition attracts his share of the business that comes from those building new homes where complete installations are required.

People Like It

"One cannot keep too much merchandise out where the buying public can see it," said Mr. Knell. "Every home owner is interested in anything that will make his home better or that will add to his comfort and convenience. I find that in a great many cases women make the first suggestions for improvements in the home. They interest their husbands and then both come down to look over our stock and decide what will be put in.

It is a decided advantage to be able to show them the various pieces set up and looking as they will when installed. Displays of this kind go a long way toward closing sales, and they have a very distinct value also in helping to keep the store and its windows interesting and attractive."

Kept Well Lighted

Mr. Knell aims to keep his windows working for him 16 hours a day. By keeping them well lighted until 10 o'clock at nights he interests scores of prospects who are down town attending the theatres or on other errands, and secures many inquiries. As stated above he gives his windows and displays the most careful attention. The windows, the window floor, and every article shown, is kept in spotless condition and looking its best. This, Mr. Knell regards as essential, and especially so in any business where women want to visit the store and make a selection of the merchandise they are buying. Women, he believes, will not visit any shop or inspect merchandise that is badly kept, much less purchase. He believes that in keeping his entire stock, not only of hardware, but of plumbing goods, in spick and span condition, he is going a long way to speed

An effective window of a wide range of plumbing equipment, including small bathroom accessories, is shown here as used by H. Knell, Kitchener, Ont. Such window displays are said to be the best advertising medium found in this store and every window display brings immediate and satisfactory results.

turnover and build a good reputation for himself and store.

"Home owners who have visited my shop," he said, "never hesitate about coming back again or sending their friends. Many might consider this an unimportant matter, but I believe it is a really big factor in building sales. Many women have an instinctive dread about going into plumbing shops, fearing that they will have to look at merchandise which is all over dust and dirt, and that they will get covered with grime themselves. It is important to the trade that this prejudice should be dispelled, and the only way to dispel it is to keep one's stock in A 1 condition. It is good for

the merchant also and keeps merchandise moving."

Mr. Knell has had good results from the use of bill board advertising. Special large signs, erected by him in conspicuous locations, have brought in business. On them he features the firm name and location and various lines of plumbing and heating goods.

Mr. Knell declares that experience has proved to him that there is an all-year need for plumbing and heating equipment, and that by going after it aggressively one can get very satisfactory and profitable business. Bathroom fixtures he finds are constant sellers, many home owners buying one piece at a time until they have a complete set.

full knowledge and consent of all interested parties.

8—He will not use unfair means to win professional advancement or to injure the chances of another engineer to secure and hold employment.

9—He will co-operate in upbuilding the engineering profession by exchanging general information and experience with his fellow engineers and students of engineering and also by contributing to work of engineering societies, schools of applied science and the technical press.

10—He will interest himself in the public welfare in behalf of which he will be ready to apply his special knowledge, skill and training for the use and benefit of mankind.

Code of Ethics for Engineers Adopted by American Society

Annual Guidebook Outlines Guiding Code for Maintenance of the Dignity of the Profession—Well Worth Consideration of all Engaged in Engineering Work

THE American Society of Heating and Ventilating Engineers, in their 1923 guidebook, have included a "Code of Ethics for Engineers," the text of which is well worth reading and considering.

Engineering work has become an increasingly important factor in the progress of civilization and in the welfare of the community. The engineering profession is held responsible for the planning, construction and operation of such work, and is entitled to the position and authority which will enable it to discharge this responsibility and to render effective service to humanity.

That the dignity of their chosen profession may be maintained, it is the duty of all engineers to conduct themselves according to the principles of the following code of ethics:

1—The engineer will carry on his professional work in a spirit of fairness to employees and contractors, fidelity to clients and employers, loyalty to his country and devotion to high ideals of courtesy and personal honor.

2—He will refrain from associating himself with or allowing the use of his name by an enterprise of questionable character.

3—He will advertise only in a dignified manner, being careful to avoid misleading statements.

4—He will regard as confidential any information obtained by him as to the business affairs and technical methods or processes of a client or employer.

5—He will inform a client or employer of any business connections, interests or affiliations which might influence his judgment or impair the disinterested quality of his services.

6—He will refrain from using any improper or questionable methods of soliciting professional work and will decline to pay or to accept commissions for securing such work.

7—He will accept compensation, financial or otherwise, for a particular service, from one source only, except with the

GAS HEATING CHEAPER

Edmonton, Alta.—With the increase in the use of gas, for heating purposes, it has been pointed out to the civic authorities by the gas company that the civic block could be heated with gas at a cost which would be \$469 less per year than heating by coal. The figures are being checked and the proposed change investigated.

THE LUXURIES OF A GENERATION AGO WHICH WERE ONLY FOR THE BANKER WHO LIVED ON THE HILL—

ARE BENEATH THE CONTEMPT OF THE AVERAGE WAGE EARNER OF TO-DAY.

How the Sales of Furnaces Can Be Boosted During the Autumn Months

Stressing the Idea of Selling Heating Systems Preferable to Selling Furnaces—Convince Customer of Value of Service Rendered in Installation Work—Economy in Use of Fuel Another Strong Sales Argument

THERE is every indication that the furnace business this fall is going to outstrip by far that of the past two or three years. Representative dealers throughout the country are reporting a volume of business available that is highly gratifying to the trade at large and are already making heavy inroads into it. This being the case, it is up to every progressive dealer to make sure of his share of the increase.

One of the big problems that he is bound to have to contend with is the fact that many house-owners think of the purchase of a furnace too much from the price basis and give scant regard to

the service to be obtained. Of course, there are those people with whom quality and satisfactory service mean little—speculative builders who have as their main object the construction of houses on as cheap a plan as possible—but the average man is open to the sort of sales arguments that emphasize the value of a furnace that will last many years without important replacements, and to the necessity for the sort of installation that will ensure sufficient heat in the coldest weather.

It is, then, up to the dealer to give prominence to such sales arguments, both in actual conversation with his

prospects and in his advertising. Advertising often goes a long way in preparing the prospect. People must be shown how they can better their condition, raise their standard of living and add to their comfort before they will condescend to part with a large sum of money on a furnace.

A well-worded advertisement used recently by one merchant dealt with the subject of health and ventilation in a manner that could not but help greatly in paving the way for the salesman. Under the heading "Fresh Air Essential to Healthful Heating" the copy ran:

JEWEL
PIPELESS FURNACE
Made in Three Sizes
The Most Efficient and Economical Heating Appliance for the Home
As dealers familiar with all lines of furnaces, we take special pride in handling the JEWEL PIPELESS FURNACE, made by the well-known Burrow, Stewart & Milne Co., of Hamilton.
The Jewel Pipeless Furnace provides the most scientific, safe, perfect system of heating yet devised. It takes less than a day to install, and will heat your house thoroughly and economically. Elimination of heat pipes keeps the heat in the house and the house cool and the house water, and runs your coal bill in half.
Come in and let us tell you more about it. We also handle the Jewel Pipeless Furnace which is made in live size.
SOLD AND INSTALLED BY

At this season of the year, when the selling and installing of heating equipment is occupying the attention of the trade so extensively, it is interesting to note what may be done in the way of boosting business by the use of advertising. The accompanying ads. illustrate what has been done along this line by some progressive Canadian tradesmen.

Tinsmithing and Sheet Metal Work

Patterns for a Tank Charger

Written for Sanitary Engineer by O. W. Kothe, Principal St. Louis Technical Institute.

THESE tank charger working drawings were submitted for solution. A direct tracing of the drawings were made, so measurements are omitted in our drawing, although measurements can be filled in of any size as long as this method of development is used; the patterns should come out all right.

As working drawings, we only need the side elevation and a half plan. Arcs are described in plan to suit measurements. Owing to the roll all around the bottom, the corners will have to be bumped into a spherical shape, and hence will require a little trimming afterwards.

Observe our plan gives spread or flare, while the elevation gives altitude between points. So divide the quarter turns of back end in equal spaces as 3-9 and 4-10, joining the points with triangular lines.

Next divide the hopper arc 1-4 in equal parts, and drop lines into elevation as 1'-2'-3'-4'.

From these points we square out the true section C, making lines 1'-; 2'-2"; 3'-3"; 4'-4" equal in length to those in plan as 4-4', 3-3', 2-2'.

This enables tracing the outline of section C, and is the girth length along the round end of hopper.

In determining the true lengths of triangular lines, observe the back end we treat the quarter circle, and add the flat part of the bottom extra. The cut is made in the pattern as shown; that is when seams must be made as the drawings show.

Then for the front at A, the hopper is treated as a transition, while the roll is worked in by cutting the pattern as at A and B in pattern.

So let H-T be the altitudinal line, and from each point in section C as 1'-2'-3'-4' square over lines to cross H-T.

With dividers pick the plan lines as A-1; A-2; A-3; A-4; A-5; 4-5 from plan, and set them to the right of point T as shown.

Pick the rise 5-4 from line H-T, and set as T-h, and then h-5"; 4-4; 3-3, etc., are true lengths for the hopper.

The true lengths for the back end are picked and set off on the left of line H-T in points as shown, and when lines are joined with proper points—you have all true lengths necessary to set out the patterns.

The patterns are set out the same as all triangulation problems and so further comment is hardly needed.

JOBBER'S COST LAID BARE

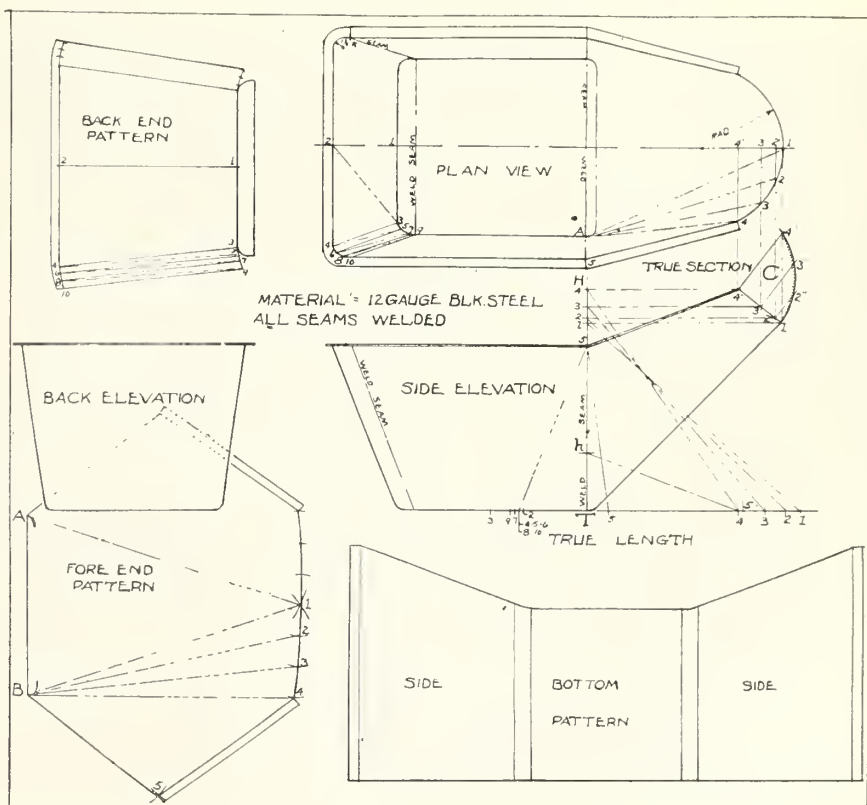

(Continued from page 12)

gin of profit on some of such lines was said to be already small enough without the manufacturer forcing the jobber or retailer to absorb the sales tax between them in order to leave the price to the consumer unaltered. A tendency in this direction was already reported by one wholesaler, a manufacturer of a line of goods carrying an established resale price having adjusted discounts so as to provide for absorbing some of the tax. It was felt that this would be done in cases where the tax really amounted to a considerable sum, but where it was a small item it was the feeling that retailers might make some adjustment of resale prices without any danger.

Concerning the policy of placing the sales tax on the invoice as a separate item, which certain manufactures state they will adhere to after January 1, the opinion of some wholesalers was that confusion would be prolonged by this plan; that there would continue a very mixed policy of taking care of the tax and that the advantages of a concealed tax would be lost.

Steady Improvement Noted in English Metal Market

LONDON, ENG.—Although the recovery in the iron and steel trades is less sensational than has been stated in some quarters, the improvement in demand is undoubtedly more widespread. Pig iron makers still hold large stocks, but business is now sufficient to absorb current production, while the revival of forward business is especially encouraging. It is expected that Japanese orders for iron and steel will be slow to materialize but other overseas orders are accumulating, including large orders from Brazil, Colombia and India.

Sales Letters for Owners of Stores, Theatres and Garages in Connection With Good Health Week

Emphasis Placed on the Safety to Health That is Found in Adequate Sanitary Facilities—Economy of Good Equipment Also Stressed—Letters Cover Entire Available Field

(Garages and Filling Stations.)

FIRM LETTERHEAD

Date.....

Dear Mr. (or Mrs.):

You are courteous and considerate of customers—you give them prompt service. You are careful to create an impression of square dealing.

You do all this because your judgment tells you it is the profitable thing to do. But, the motoring public has learned to expect another service that you cannot afford to ignore. That is, providing modern comfort station facilities.

People will drive extra miles to reach such conveniences—and buy where they find them. There's not much room to advertise just gas, oil or repairs, profitably; but you can bring the folks to your runway by advertising a clean, inviting, well-ventilated toilet and rest room.

The individual farm or suburban water system makes it possible to have a sanitary comfort station anywhere there's a stream or a well, or even a rain water cistern.

We will be glad to show you how economically your comfort station may be installed and operated—made almost self-sustaining with coin operated locks and vending machines.

Yours for greater profits,
Your signature,

City

(Letter to owners of stores, theatres, etc.)

FIRM LETTERHEAD

Date.....

Dear Mr. (or Mrs.):

Why do the most desirable patrons go most to certain theatres, garages, restaurants, etc.?

Other things being equal, it's because of superior consideration for their comfort and convenience that they find at those places.

When you go abroad from your own premises, what do you find that you appreciate more than wash room and toilet facilities that are clean, inviting, sanitary and well ventilated? Surely, your own patrons will react the same way to the same things.

Modern comfort service in hotels, stores, theatres; all public and semi-public places; influences people favorably. The public has a right to expect that those who solicit public patronage should provide adequate sanitary facilities.

During National "Good Health Week" October 21st to 27th, much attention will be directed to such things. Let us help you to economically make such improvements.

Yours for better sanitation,
Your signature,

City

(Letter on general sanitation)

FIRM LETTERHEAD

Date.....

Dear Mr. (or Mrs.):

If this letter can tell you how to protect your health, it's worth reading, isn't it?

Entire communities have been stricken with disease because of obsolete or total lack of means of sanitation in some home, factory, store or other building.

The week of October 21st to 27th has been set aside as National Good Health Week. Civic bodies, sanitation leagues, plumbing dealers and heating contractors will strive to make everybody realize the need for modern sanitation, ventilation and hygiene.

No home is safe, no building is fit to work in; and no public place has the right to solicit patronage unless completely equipped with modern plumbing, heating and ventilation.

We will be glad to offer suggestions, and show how economical such equipment really is. Let us help you with the improvement of your property.

Yours for better living,

The Two "Better Relations With the Public" Windows

WINDOW display 105 will effectively stimulate demand for modern, sanitary plumbing; and, at the same time, promote better relations with the public. It points the lesson that the plumbing dealer or heating contractor renders a service that is praiseworthy as well as necessary.

The first step is to drape the entire back ground and side walls with light colored soft cloth. Gray ramie cloth will do nicely. The cloth should be gathered in folds and allowed to drape itself naturally.

The window show here is just about 4 feet deep from glass to background.

Next, built a false floor over the entire bottom of the window, about 3 feet above the side walk outside.

Out of wall board or light lumber, sawed to shape, build an archway and walls as shown in the picture. The archway should be in the centre of your window about 2 feet six inches from the front, with two walls running diagonally from the sides of the arch to the front corners of your window. Out of similar material, saw the profile of a good looking little house; and set this about one foot back of the arch, so that it appears clearly in view through the archway. All these, of course, should be appropriately painted in water colors.

Make a roadway with sand, leading through the arch as indicated by the pic-

ture. Cover the rest of the floor of your window, wherever in view, with window decorator's grass, real sod, or with excelsior broken up small and dyed green.

Use small twigs of shrubbery or evergreen, to reproduce the effect of shrubbery and trees as shown in the photograph. Be sure to get a few spots of this in front of the walls; and paste a few sprigs of some small vine on the walls in the manner shown by the photograph.

Place a big sign across the raised front of the false floor, bearing the legend shown in the picture. Add the lettering over the archway, and the three miniature signs, shown in the picture, and you will have a very effective display.

Be sure to use the three little signs shown in the picture, one on the house, and two as posters, one on each wall. They are an important part of this display. The one on the house should read "Modern Plumbing (& Heating)," with your own name and address as a signature. The two on the walls should show your name and address followed by the legend, in one case "Modern Heating—Steam—Hot Water—Vapor;" the other should read "Modern Sanitary Plumbing."

Show window 106 provides the heating contractor with a truly effective display. It cannot help attracting the interested attention of the passer-by, to

the fact that "Heat by Radiators" offers more advantages of comfort, economy, and convenience, than any other method.

The first step is to drape the entire background of your window with soft light-colored cloth, allowing it to fall into natural folds. Cloth used in our window is gray ramie cloth.

Then, with wallboard or light lumber, build a false background for your display, tinting it attractively and cutting an archway in the centre. This archway should be proportioned to the size of the radiator you intend to use. Place this false background close against the rear of your window, with the drapery showing through the archway. Immediately in front of this place a box, or some other pedestal for your radiator, about 6 in. to 8 in. high. Place this slightly diagonal to the rear line of your window, and cover it with drapery of some agreeable contrasting color. This drapery in our window is tan ramie cloth. On this pedestal place your radiator, showing it fully equipped with valves, etc., as if actually in service.

In front of this, on the floor of your window, place a rug of appropriate size. Also place a floor lamp and a good looking chair in position as indicated by the photograph. You should have no difficulty in borrowing all of these articles from the furniture store.

Heating and Ventilating Department

Results of Tests of Radiator Traps

Performance Data on Nineteen Radiator Traps Covering Venting of Air, Drainage of Water, Trapping of Steam, and Freedom From Noise

AN IMPORTANT work has been done during the past year by the Committee on Research of the National Association of Building Owners and Managers in testing radiator traps. No less than nineteen well-known makes were selected and subjected to a comprehensive series of laboratory tests. It is proposed to follow these up with reports on experiences in building operation covering the points of freedom from fouling and maintenance.

The full test figures and data are contained in a preliminary report published by the association. In addition to the tests themselves, the report takes up in an interesting way the principles of heat, the various types of heating systems and boilers, together with a general discussion of the functions and classifications of radiator traps.

As the report states, a complete and adequate system of tests would measure each trap in respect to its performance of all of its duties, including:

- (a) Venting of air.
- (b) Drainage of water.
- (c) Trapping of steam.
- (d) Performance under service conditions.
- (e) Freedom from noise.
- (f) Freedom from fouling.
- (g) Maintenance.

Unfortunately, no single system can measure performance in all of these duties. The only way, it is pointed out, to obtain complete results lies in combining a system of laboratory testing with a system of reporting building experience (the experience of managers of buildings in the actual use of the traps with which their buildings are equipped).

Advantages and Disadvantages of Laboratory Testing

The system of testing which the Committee on Research worked out for laboratory use covers the first five of the seven enumerated duties of the trap. Laboratory testing, it is added, so far as these five trap duties go, produces results of a considerable degree of accuracy and, so far as different kinds of traps go, a considerable degree of fairness.

The advantage of laboratory testing, as far as it goes, lies in the exact sci-

tific methods used and results recorded. The disadvantage lies in the limited ground covered.

Value of Building Experience

The value of data based on extended service in buildings is emphasized in the report by the statement that it is upon building experience (the experience of managers of buildings in the actual use of the traps with which their buildings are equipped) expressed in the form of questionnaires, that we must rely for testing the two remaining duties of the trap:

- (f) Freedom from fouling.
- (g) Maintenance.

The advantage of building experience lies, of course, in the broad ground covered. It is proposed to make hundreds, even thousands, of observations of the traps of a single make. The performance will, in most cases, cover a period of years—instead of hours. Every variety of service conditions will be covered. On the other hand, the disadvantage of building experience, as the committee recognizes, lies in the absence of exact, scientific methods, and the entrance of the human element with its capacity for error. Observations will, in most cases, be opinions, rather than test and measurement; recording, in most cases, will be in generalities rather than in figures.

The accompanying diagram (Fig. 1) indicates merely the general construction of a trap-testing apparatus.

The steam enters the trap through the inlet valve. At the opposite end of the radiator is installed the trap to be tested. The water of condensation, drained by the trap, flows directly downward into Pot A. Any steam that may be passed by the trap rises up into the condenser, where it is cooled and condensed to water, and flows into Pot B.

Condensation Ratio

Pots A and B are emptied from time to time, the water from each being carefully measured. The proportion of the contents of Pot B to the contents of both pots is obviously the percentage of steam passed and not trapped. Taken the other way around, the proportion of the contents of Pot A to the contents of both pots is obviously the percentage of steam entirely condensed in the radiator; it is the percentage of steam-trapping efficiency of the trap in operation.

Temperature Ratio

As to water-draining efficiency, this is tested by thermometers T_0 attached to the outside of the radiator at different points. These indicate by their temperatures whether inside the radiator at these points there is (hot) uncondensed steam, or (cooler) water of condensation. These temperatures by their proportions indicate the water draining efficiency of the trap in question.

Air-venting efficiency is considered indicated by the same thermometer and

Fig. 1—General Diagram of Testing Apparatus.

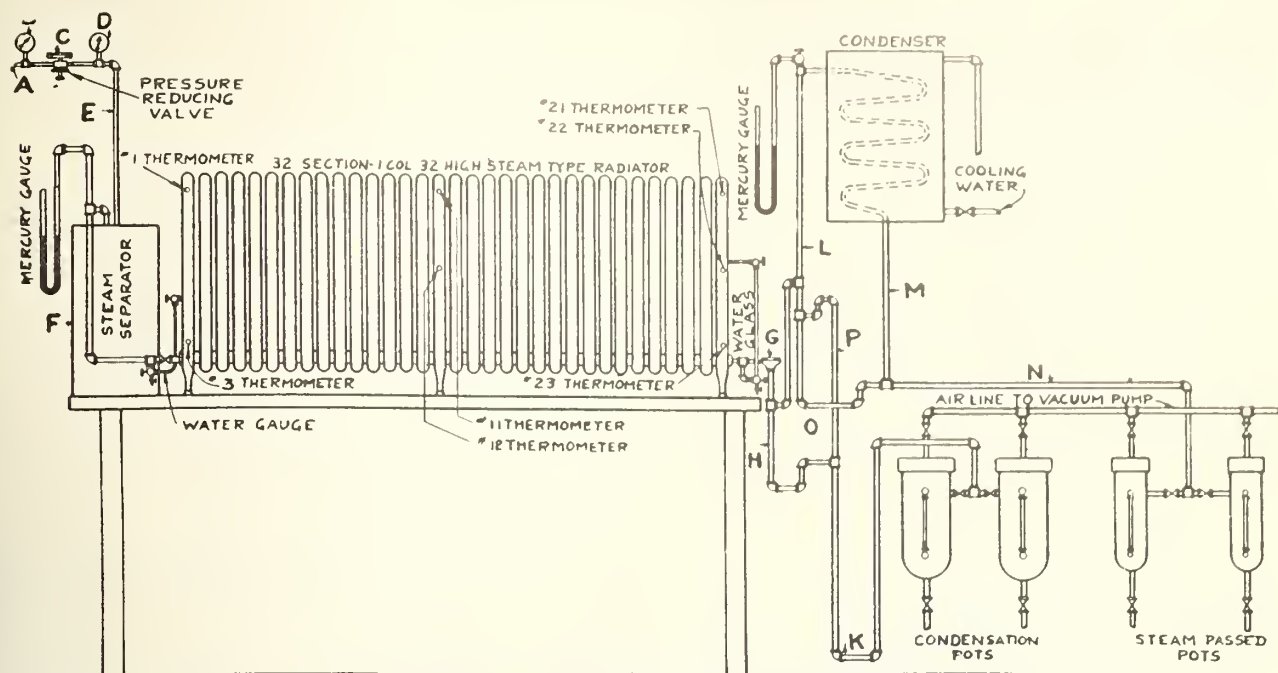

Fig. 2—Apparatus Used in Committee's Tests.

temperature proportions that indicate water-draining efficiency.

Testing Apparatus Used

Fig. 2 indicates the exact construction of the apparatus used in the tests made by the committee. This apparatus, it may be added, conforms in every respect with that used and recommended by the United States Bureau of Standards. The total radiator surface is 80 sq. ft.

The steam used comes by way of supply pipe (A) equipped with a steam gauge (B), a reducing valve (C), and a second steam gauge (D). By operation of the pressure-reducing valve and by observation of the two steam gauges, the different pressures required by different tests are obtained.

The steam passes by the pipe (E) into a steam separator where any water of condensation is collected and from the top of which clean and dry steam can be taken by the pipe (F). To this pipe is attached a mercury gauge registering in inches the pressure of the steam actually used. In the tests of the committee, the first set of tests was at 6 in. pressure and 10 in. vacuum; the second at 6 in. pressure and 0 in. vacuum; and the third at 1 in. pressure and 5 in. vacuum.

The steam passes by the pipe (F) and by an inlet valve into the radiator, the pipe and the first column of the radiator being cross-connected by the glass water-gauge. Any water of condensation about the inlet valve and the adjoining column or two of the radiator is indicated in the water-gauge. The temperature of the incoming steam was calculated according to the indicated pressure at which it entered the radiator.

(To be concluded in next issue)

(Continued from page 16)

"Too many people forget the relation of fresh air and adequate ventilation to the healthful heating of the home. Heat without ventilation becomes 'stiffness'—a decided lack of pure, fresh, invigorating air.

"You can't get successful and adequate ventilation by merely opening the windows. Instead, such a practice defeats your purpose.

"Ventilation should be a part of the heating system to insure permanently successful results. Thousands have found this true in the — furnace, installed in efficient manner by expert workmen, such as compose our staff."

Another firm approaches the furnace question from an entirely different point of view, yet one which is of vital importance in the mind of every furnace owner, particularly in these times of uncertain fuel supply and consequent high prices.

Across the top of the advertisement was shown a loaded coal truck with the caption "Reduce the Number of Those Loads," and followed by the copy. "How many times a year does the coal truck have to stop at your residence? Why not reduce the number of coal deliveries and get perfect heat as well? Coal costs won't bother you nearly so much if you instal a — furnace."

There is a point that should be borne in mind, however, in the advertising of furnaces. It is not enough to advertise furnaces as you would stoves and leading people to believe that all there is to the furnace business is to buy one and set it up as you would a stove. The idea of selling a heating system should be stressed, service being taken into account.

There are the questions of capacity—the ascertaining of the required amount of heat for a given building and the form of installation that will provide this amount most economically. There is the providing of the right size and kind of chimney, the ascertaining of the best location for radiators and registers and their required capacities for the rooms to be heated and other problems dealing with the piping. All these must be given consideration if service is to be provided and it is this expert service that the customer must be made to consider in purchasing a heating system.

Quite frequently when purchasers of furnaces do not secure results, the furnace is blamed when as a matter of fact the fault lies with the person who installed the furnace. It is a regrettable feature that a good furnace made by a reliable manufacturer is often unjustly condemned by the user because results are not as expected.

May Locate at Soo

Sault Ste. Marie, Ont.—Consideration is being given by the Board of Trade to a proposition of L'Air Liquide Society to establish a branch plant here, a canvass of the different users of oxygen and acetylene indicating that the demand would be sufficient to meet the expected output of the firm.

Factory Changes Location

Buffalo, N.Y.—The plant and offices of the J. H. Williams Co., tool manufacturers, will be removed to this city from their present location in Brooklyn. A representative sales force will retain offices and warehouses in Brooklyn.

Ventilation Problems

AN OLD theory of ventilation was founded on the belief that decidedly harmful substances were present in respired air, and as a result the removal of such air and its replacement with fresh air was practically the only factor considered worthy of discussion.

Foul air was considered as air that had been contaminated by human respiration and fresh air its antithesis, provided always it was obtained from out of doors and not from any place inside a building.

These terms, unfortunately, still encumber much of the literature of "aerology" and prevent to a great extent the proper appreciation of what ventilation means at the present time and what really can be accomplished by properly-designed mechanical equipment.

Leonard Hill, in his report of the recent experiments in the Physiological Laboratory of the London Hospital Medical College, says:

"Heat stagnation is the one and only cause of the discomfort arising from the so-called vitiated atmosphere of crowded rooms. The moisture, stillness and warmth of the atmosphere are responsible for all the factors, and all the efforts of the engineer should, therefore, be directed toward cooling the air in crowded places by setting the air in motion by fans."

It is, therefore, apparent that the physical condition of the air is of great importance, indeed it is the determining factor so far as physical comfort is concerned. At the same time the engineer cannot safely neglect the dust content of the air, the bacteria it may contain, odors that may be present, an excessive amount of carbon dioxide, a deficient supply of oxygen or the presence of deleterious gases.

In solving ventilation problems, each must be given its proper weight as a part of the whole.

Heat Transmission

DEFINITE steps are being taken by many authorities. There is a tendency among the plumbing trade in Canada the object of bringing about more efficient heating and the saving of fuel. The Building Research Board, an English body which has been working on the subject, deals at length with walls of brick, plaster and concrete in a recent statement. The results confirm in a remarkable way the long-held opinion that no method of building is cheaper, or more effective in regard to heat transmission, than timber frame con-

struction. The section used for the experiment was $\frac{3}{4}$ -in. weather boarding on 1-in. rough boarding outside, with lath and plaster inside, all on 4-in. by 2-in. studding. This method gave the low heat transmission factor of 9.6 B.t.u. per square foot per 24 hours for 1 deg. F. difference of temperature between the wall faces inside and outside the structure. Brick in lime mortar ($8\frac{1}{2}$ -in. work) was next with 14.1 B.t.u., and then came stock brick 16.3 B.t.u. (9-in work).

Three appendices, dealing with similar research respectively in Norway, Sweden and Germany, furnish correlated information and add materially to the value of the report. Among other things it has been established that sawdust is an excellent filling for hollow walls; that lightly-burnt bricks are better non-conductors than burnt-hard bricks; that it is important to prevent the circulation of air in hollow walls and to ensure that it is kept dry; and that it makes all the difference whether the main body of an external hollow wall is on the outer or inner face. If the bulk of the material is inside, it is the more easily maintained in a dry condition; it is more efficient, and there is a corresponding economy in fuel consumption for equal heating.

It may be asked: What is the practical value and outcome of these experiments? H. O. Weller, the Director of Building Research, furnishes an excellent answer in his introduction. Taking two recorded results with bricks from Dr. Griffiths' principal table, he shows that over a period of 170 days—an assumed season for artificial heating—there would be a saving of about 1.13 tons of coal in a six-roomed house if the more efficient brick were adopted for building.

Misplaced Condemnation

IN DISCUSSING business conditions with manufacturers these days one frequently hears the statement that people are buying too many luxuries on extended payment terms and thus straining credits; that such buying of luxuries is resulting in a neglect of buying of necessities and that such a condition is responsible for much of the present situation in business which in some lines is described as "uncertain." Pointing out that credit is the servant and not the master, a prominent financial authority recently stated that credit may be used either to minimize or to exaggerate the effects of the imperfect adjustments of trade and industry but that credit in itself is not the cause of the cycles of prosperity and depression.

There is a tendency among the plumbing trade in Canada to go on the cash basis instead of credit. A condition of credit strain such as has been existing here for some time past is apt to encourage this tendency and even to cause alarm. The credit principle should not altogether be blamed, however, for strain on it is more likely the result of abuse than use. The fact remains that 90 per cent. or more of the world's big business is done on credit.

Men borrow money because through credit so available they can carry out transactions that they believe will yield profits. They may be mistaken, but it is hardly logical to blame their mistakes on the availability of credit. Even if they were saved from their mistakes, either because no credit could be had at all, or because those in control of it exercised superior judgment, the situation would not be one whit altered. It is the degree of accuracy with which the collective business judgment estimates a given situation, that determines the outcome of enterprise. The fundamental characteristic of any well organized credit system is that credit shall always be available for sound business enterprises.

At the same time the importance of credit and the responsibilities of those in control of its use, cannot be minimized.

Too Much Propaganda Interferes With Business

TWO places at which we stopped the other morning were widely different in every respect. One was a newspaper office; the other a hardware store. The two men we talked with were distinctly opposite types. One was a city editor; the other a merchant. And yet both talked on precisely the same subject.

"I get enough confounded advertising literature, propaganda, poor advice and unnecessary suggestions through the mail, every day, to keep an old-time election bon-fire going for eight hours running," was the greeting we received from the merchant.

"It's a shame," he continued, "the amount of money that's spent on this kind of stuff. If I attempted to read one-quarter of it I'd never get time to do any real business. Something ought to be done about it."

In the city room at the newspaper office the floor around the city desk was littered with papers, pamphlets and envelopes in riotous confusion.

"What's the matter; had a cyclone?" we asked.

"What do you mean; that stuff on the floor?" queried the city editor looking up.

We nodded.

"No; that's just part of the propaganda we get here every day," he replied. "The way it comes in you'd think everybody spent most of their time doing publicity stuff."

"I'd like to have the amount of money that's spent in just one day on propaganda in this country. I'll bet I could live like a prince 'till I'm a hundred and then leave enough to found a hospital," he concluded.

The opinions of these two men are typical expressions of a belief that is growing throughout the country.

If one-half of the money now spent for propaganda were invested in constructive business enterprises, in better wages and in carefully planned and intelligently placed advertising, distribution costs might be lowered, and perhaps there would be less need for the purely explanatory and defensive propaganda that now finds its way to the waste basket in every office of the land. What do you think?—Hardware Age.

Why Percentages Should Be of the Selling Price

Minute Message No. 30

Written for Sanitary Engineer by FRANK STOCKDALE

Profit-Figuring Series

A MARK up of 33 1-3% of the sales is exactly one and one-half times as much money as the same percentage of the cost.

Suppose an item costs \$3.00—

(1) 33 1-3% on the cost is a mark-up of \$1.00, making the selling price \$4.00.

(2) 33 1-3% of the sale is \$1.50 and the selling price is \$4.50.

The difference is \$.50 on a \$4.50 item—more than ten per cent. of the selling price and exactly one-sixth of the cost, which in itself makes a very good net profit.

The above illustration shows the difference in the size of the mark-up when the same percentage is taken from the cost and the selling price of any item.

If the cost of doing business were 25% of sales—and cost of doing business is almost always of sales—the merchant would just break even with a mark-up of 33 1-3% on the cost.

In other words there is just as much money in "cost of doing business" section of the whole circle as there is in the shaded section—"cost of goods."

Better be safe than sorry.

Figure percentage of mark-up of your sales.

How Modern Machinery Kept Down the Overhead for a Heating Contractor

Power Pipe-cutting and Threading Machines Shown to Save Money and Make Hard Work Easy—Gets Work Done Quickly—Some Actual Facts and Figures—Machines for the Small or Large Shop

Written for Sanitary Engineer by EDWIN NEWSOME, Consulting Sanitary and Heating Engineer

NOT very many years ago the writer took a contract to instal a heating system. The largest size of pipe on the job was four inches. Not having a pipe machine to cut such a size, figures were procured to cut and thread all the pipe for the job, above two inches in diameter. The best price submitted was \$61.75. The pipe had to be hauled back and forth by the heating contractor and the cost of this would have amounted to \$14.30, bringing the total to \$76.05. That's one story.

Another experience: A heating contractor took a job about four miles from the city. Some eight inch pipe was necessary for the job. The contractor had been in the habit of getting his pipe cut at a local machine shop, which by the way, he had run up such a business as to warrant the purchase of two pipe-threading machines, and the writer was informed by this very machinist that his pipe-threading machines paid him the biggest profit of any investment he had made.

This heating contractor, having the large pipe to cut and thread, could see plainly that to haul backward and forward all the pipe in sizes from two and one-half inches to eight inches, was going to increase his cost and cut a big slice off his profits. He therefore began to devote some time to finding out how he could increase his business on the whole, and how this particular job could be made to show a substantial gain in place of a big loss.

This contractor never dreamed that to instal power pipe-threading machines

would be the means of revolutionizing his business, but it was, and to-day that very concern is one of the largest in Canada. The writer, in speaking to the proprietor not very long ago, referred to the time, years ago, when power machines in the shop were looked upon as luxuries, to which the proprietor replied with feeling: "It's beyond my power of comprehension to know how we managed to get the work out with the aid of the machine shop."

Speaking to another contractor some years ago, the statement was received that the small contractor, employing one or two men, could not afford to invest in power threading machines. The time has come since, though, when this contractor had an opportunity to tender on a little bigger job than he had usually undertaken, and his revised opinion is that a power machine meant more to him than three or four extra men. To-day, though, this man conducts only a moderate sized establishment, he has often stated to the writer that the power pipe-threading and cutting machines solved his labor problem.

Get Down to Real Data

First of all, power pipe machines are designed to cut and thread pipe at a lower cost than is possible by the use of man power. The cost of a man, even a laborer, would be at least forty cents per hour and hand pipe-threading is hard work. Thus, there is a first loss on even a forty cent per hour man on account of reduced production in pipe-cutting and threading.

In the designing of a power machine for cutting and threading pipe, the material of which the pipes made must be known so as to determine the speed at which it can be cut. Specially tempered tool steel for the dies or chasers must be furnished and the speed at which such dies will cut a clean thread must be determined also.

The ease with which various changes of speed can be effected is an important factor and the period of time taken to cut and thread a pipe is a matter to be computed easily. The motive power and transmission to the threading machine plays an important part with the numerous changes of speed procured in a gear box.

Now, the rate of travel is the factor which determines the threading speed and, of course, the greater the speed of pipe travel, the more thread can be cut per hour. Most electric motors travel at a very high speed and this speed must be reduced, thus bringing, as it were, the speed down to actual brake horse power, for after all, all forms of power work act as a kind of brake upon the agency from which the operated machine derives its motion.

Speed to Cut and Thread Pipe

Experience has proven without doubt that a pipe should not travel faster than twenty feet of its circumference a minute when being threaded and if a small pipe, say one inch in diameter, is being threaded, it must revolve at a greater speed than if a two-inch pipe were being

Showing pipe cutting and threading machinery.

Pipe cutting and threading machinery in use.

threaded. For example, the circumference of a two-inch pipe is 7.4 inches and that of a six-inch pipe is 20.8 inches. On threading pipe of these sizes the die must cut metal from the pipe as it travels round, and it must cut it off smoothly so that when screwing the pipe into a fitting the threads will fit well and insure a really tight joint.

Very well, let us say that the pipe is being turned round at a speed of twenty feet per minute. The size is two inches; therefore the pipe would have to revolve 32.5 times per minute, so that it would take about one minute of actual time to cut two, and one have a two-inch thread. A two-inch pipe has about twelve threads to the cut.

When a six-inch pipe is being threaded, the pipe must revolve about fourteen times to cut a complete thread and traveling at the rate of twenty feet per minute this would mean that the pipe would revolve 11.5 times per minute, which proves conclusively that a six-inch pipe can be threaded in about one and one-quarter minutes.

More Than Mere Threading Time

It might justly be said that it takes time to insert pipe in a machine and take it out; that the mere threading of the pipe is only part of the time involved. Just so, and for the benefit of the reader and for the trade as a whole, tests have been made by a disinterested plumber and steamfitter.

Several changes had to be made just as would occur on a job. Short lengths of pipe were used, not more than five feet, and the time items included in the threading time includes locking pipe in vise, cutting the thread and releasing the dies. Cutting time includes putting on cutter and making cut, which two operations complete the job. The sides of pipe varied from one-inch to four-inch inclusive.

Table Showing Time Taken in Cutting and Threading Pipe by Power Machine

Pipe Sizes	To Cut Min. Sec.	To Thread Min. Sec.	Total Min. Sec.
1 in.	0 14	0 40	0 54
1¼ in.	0 15	0 40	0 55
1½ in.	0 15	0 50	0 65

2 in.	0 20	1 00	1 20
2½ in.	0 26	1 20	1 46
3 in.	0 28	1 30	1 58
3½ in.	0 30	1 40	2 10
4 in.	0 32	2 00	2 32

The Human Factor

To procure the greatest degree of efficiency from a workman these days is to make hard work easy. That is a statement easy to prove. The day is gone when a man takes pride in his job if it be a hard one. Men, as a rule, are only overgrown boys and, like boys, are pleased to see a lot done in a day. There is a certain amount of satisfaction in being able to feel like the village blacksmith referred to in the poem that runs: "Under the spreading chestnut tree, the village smithy stands," where the smith's heart feels glad as he reflects: "Something attempted, something done, has earned a night's repose."

Hard work made easy by the adoption of power pipe-threading machines secures results sufficiently great to warrant in most cases the cost of investment in such machines.

There is no doubt whatever but that the plumbing and heating industry will have to adopt more labor-saving equipment in their business, and it is astounding to find out the amount of waste ends of pipe that could be turned into good stock.

The writer once showed a clear margin of \$800 in one year in a certain shop as the direct result of being able to have all short pieces of piping from each job threaded up and put into stock. A number of bins filled with short, threaded pieces of pipe are a boon to every shop and particularly when a big "roughing in" job is being handled, and when these short ends can be made into good saleable stock by the use of power machines, it seems almost an industrial crime to permit the waste.

TWO BETTER RELATIONS

(Continued from page 19)

From the toy store borrow a dressed doll, of the same size as an average child of a year in age. Get, from the same source, a set of alphabet blocks. Pose

this doll with the blocks, as shown by the photograph.

On each side wall of your window, place something in the way of wall ornamentations that will harmonize with the rest of the window.

The large card shown in the centre below the radiator in this picture reads: "HEAT BY RADIATORS—Is The Modern Way of Warming Any Building With The Most—COMFORT, ECONOMY, CONVENIENCE." The other card at the right hand of this picture reads: "STEP IN—You Are Cordially Welcome to Question Us About—HEAT BY RADIATORS."

CAMPAIGN FOR WATER SYSTEMS

St. John, N. B.—James Robertson and Co. Ltd., have instituted a campaign in behalf of water systems for country homes. Exhibits have been placed in most of the Eastern Canadian fairs, as one of the principal means of attracting attention to the campaign. To each visitor to the fairs, the following circular is given: "You can have running water in your country home and enjoy the same conveniences as those living within the city limits.

"The price is reasonable, as the cost of upkeep is remarkably low, and the saving in time and labor proves a most valuable investment for the home in the country.

"These systems can be supplied by us for use by hand, gasoline or electric power, all units being supplied complete, and range in size from those for bungalow to the largest farm building. You will find our exhibit where our attendants will be pleased to demonstrate our systems and quote prices."

The local manager of the company is E. J. Terry, who is also president of the St. John Exhibition Association, and he has been instrumental in utilizing the fairs in the company's energetic campaign in behalf of the water systems.

DISCONTINUES BUSINESS

Broadview, Sask.—G. E. Sterling, who has conducted a tinsmithing business here, has discontinued his establishment.

News Notes From Coast to Coast

Doings in the Plumbing and Heating Industry

NEW BUSINESS

Comber, Ont.—O. R. Stevens, formerly of Chatham, has opened a plumbing and tinsmithing business over Reid's Hardware. Mr. Stevens has had considerable experience in this work in Chatham.

NEW PLANT OPENED

Ottawa, Ont.—W. G. Edge, Ltd., heating, plumbing and sheet metal contractors, have announced through the local press the opening of their new factory, which is fully equipped for all classes of sheet metal work.

SUFFERS FIRE LOSS

London, Ont.—In the recent disastrous fire in the business section of the city the Wright Teal Plumbing Co. were among the firms whose premises were damaged.

NEW BUSINESS

Windsor, Ont.—The Universal Oil Burner Co. Ltd., which has established temporary headquarters at 11 Brock St., will manufacture and market in Canada, principally through the heating, plumbing, and electrical trades, a smokeless oil burner, which is the invention of Donald Stuart, president and chief engineer of the company.

ON BUSINESS TRIP TO CANADA

Gilbert Shanks, of Shanks & Co., Barrhead and Kilmarnock, Scotland, manufacturers of a wide range of sanitary enameled ware, is at present in Canada on a business trip. He is spending some time with W. H. Cunningham, of W. H. Cunningham & Hill, Ltd., representatives in Canada for this line. He will visit all the chief points in Canada through to the Pacific coast.

PERSONAL

G. W. Mallory, Blenheim, Ont., manufacturer of the Marvel door holder, is now on his annual trip east to the coast, calling on the wholesalers.

George P. Fraser, Toronto, representing Sand's levels, Armstrong tools, Trimo wrenches, Detroit torch, etc., has left for a business trip to Vancouver, calling on the trade at intermediate points.

STOVE WORKS ENLARGED

Hamilton, Ont.—The Hamilton Stove and Heater Co., Ltd., has completed the arrangement of its manufacturing plant extending the buildings used for manufacturing to the rear and least valuable part of the property, taking advantage of the high rents available on the John St. frontage, which is one of the most

important cross-town streets in the city. This arrangement has provided approximately 25 per cent. increase in capacity.

OPEN NEW SHOWROOM

Toronto, Ont.—The Pease Foundry Co. have rented the premises next to their downtown offices on King St., and will open them shortly as a boiler showroom. The space at their disposal will allow a wide showing of their goods, as well as providing additional stockroom space in the rear.

SECURES HEATING CONTRACT

Durham, Ont.—The contract for installing a new hot water heating system in the North Grey Registry Office, Owen Sound, has been awarded to J. H. Harding, local plumber and hardware merchant. This is the first occasion a local firm has secured a contract in the county town against county competition.

ENGLISH FIRM CHANGES HANDS

London, Eng.—Announcement is made of the purchase of the Woodchester, Glos., works of the United Brassfounders & Engineers, Ltd., by Newiman, Hender & Co. Ltd., whose business was absorbed by the United Brassfounders in 1910. A complete line of valves, cocks, and general steam and water fittings will be manufactured.

BELLEVILLE FIRM BUSY

Belleville, Ont.—The contract for re-modelling roof and cornices of the post office building has been awarded to Howe & Hagerman, sanitary and heating engineers. This firm also has workmen engaged installing plumbing, heating, and ventilating systems, in two schools in Sydney Township, and the new consolidated school at Frankford, and has just finished a large contract in the new Coleman ward school.

LARGE HEATING INSTALLATION COMPLETED

Montreal, P. Q.—The new heating plant of Henry Morgan & Co. Ltd., St. Catherine St., departmental store, has been completed and put into operation. The heating plant is across the road from the main store block, and connected to it by a subway. The building housing the new plant occupies a space 75 by 100 feet.

RETIRE PREFERRED STOCK

Toronto, Ont.—Shareholders of the Port Hope Sanitary Mfg. Co. have been notified to attend a special meeting at the head office on Oct. 29, to approve a by-law for the retirement of the preferred stock by the purchase and cancellation of 5,000 shares. The company is capitalized at \$500,000 preferred, and \$750,000 common, of which \$456,000 preferred is outstanding, and \$750,000 of common.

ROTARIANS HEAR NEWSOME

Oshawa, Ont.—A very practical address on "The Value of Sanitation" was delivered before the Rotary Club recently by Edward Newsome, of the Department of Agriculture. During the address, Mr. Newsome referred to the proposed new sanitary and plumbing by-laws, and urged that these be given full support, as the health and success of any community depends very largely upon its system of sanitation, and its water supply.

APPLIES FOR SANITARY POST

Amherst, N. S.—An application has been received from J. B. Black, by the town council, asking that his qualifications be considered when the post of sanitary inspector, made vacant by the death of the late Mr. McCaughey, is made. The vacancy has not yet been filled.

MAKING SANITARY SURVEY

Stouffville, Ont.—Norman M. McLean has been appointed by the Board of Health to make a sanitary survey of the civic territory. Stouffville is without a proper sewage system, and there is a network of drains, laid by private enterprise, of which no record exists. Hydro workmen installing the new power system were constantly discovering drains while digging postholes.

WILL ENFORCE REGULATIONS

Peterborough, Ont.—While the local health authorities have met with a good deal of success in their campaign to rid the city of unsanitary outdoor closets, Sanitary Inspector C. S. Stapleton has reported to the Board of Health that there are a number of residents who have been warned to make the change who have ignored the warning. It has been decided to prosecute these offenders.

CHLORINATING PLANT OPENED

Cobalt, Ont.—The chlorinating plant at the town water pumping station has been placed in operation and citizens are rapidly becoming accustomed to the change in the taste of the water.

Important Changes in Bankruptcy Act Effective October 1

Outstanding Feature is the Abolition of Present System of Authorized Trustees and Substitution of Procedure More Favorable to Creditors — All Assignments to be Made to Official Receiver

THE outstanding feature of the Bankruptcy Amendment Act, which comes into force on October 1, is the abolition of the system of authorized trustees and the adoption of the English method of administration of insolvent estates by trustees elected by the creditors, the main object of the new Act being to give the appointment of the trustee or trustees at the outset to the creditors, who are most interested in choosing a proper person. This will ensure the feeling on their part that they can have confidence in the trustee.

Under the Bankruptcy Act of 1919, a large number of authorized trustees were appointed by Order-in-Council, especially in the Province of Quebec, with unsatisfactory results to commercial interests in numerous cases. Consequently, a joint committee of the Canadian Manufacturers' Association and other organizations, after several meetings, made representations to the Department of Justice, with a view to securing the substitution of a method of procedure which would ensure the trustee being the servant of the creditors and not of the debtor. The amending act is the result.

Under this measure, all assignments are to be made to an official receiver, in each bankruptcy district, who shall be deemed to be an officer of the court and shall be appointed by the Governor-in-Council.

Concurrently with the making of the assignment, the assignor must deposit with the official receiver his sworn statement of assets in the prescribed form, showing the property of the debtor divisible among the creditors, the names and addresses of all his creditors and the amounts of their respective claims, and the nature of each, whether privileged, secured or otherwise. The assignment is then filed with the court by the official receiver. The official receiver then appoints a custodian, whom he shall, as far as possible, select from the most interested creditors.

The custodian then takes charge of the property of the debtor and the debtor ceases to have any capacity to dispose of or otherwise deal with such property. In the case of compulsory assignments, the appointment of a custodian will be made by the court.

The custodian then calls a meeting of creditors within fifteen days. At this meeting, the creditors shall by ordinary resolution appoint any person but the official receiver as trustee for the administration of the estate. A trustee

may be removed and another appointed or substituted at any meeting of the creditors.

Where an insolvent debtor intends to make a proposal for a composition, extension, or a scheme of arrangement of his affairs, he may, after the making of a receiving order against him, or the making of an authorized assignment by him, require in writing, the trustee duly appointed to convene at the office of such trustee a meeting of such debtor's creditors, for the consideration of such proposal. If the Court approves the composition, extension or scheme on being duly submitted to creditors, and shareholders, it may make an order annulling the Bankruptcy or Authorized assignment, and vesting the property of the debtor in him, or in such other person as the Court may appoint, on such terms and subject to such conditions, if any, as the Court may declare.

Sanitary Inspectors' Association Re-elect E. W. J. Hague as President

E. W. J. HAGUE, chief health inspector, Winnipeg, Man., was re-elected to the presidency of the Sanitary Inspectors' Association of Canada at the eleventh annual convention of that association, held in Calgary in September. A. Officer, tenement and supervising inspector, Winnipeg, Man., was re-elected secretary-treasurer.

The election of branch presidents resulted as follows: Ontario, A. R. White, chief provincial sanitary inspector, Toronto, Ont.; Manitoba, J. W. Richardson, sanitary inspector, Transcona, Man.; Saskatchewan, A. Wright, sanitary inspector, Prince Albert, Sask.; Alberta, L. H. Bennett, principal, Institute of Technology, Calgary, Alta.; British Columbia, H. S. Sturgess, Vancouver, B. C.

The executive council for the year is composed as follows: President, immediate past president, branch presidents, secretary-treasurer, A. Rigby, R. McQuillan, F. C. Austin and H. H. Marshall.

The presidential address, dealing with "The Sanitary Inspector. What He is, What He Should be, and His Value to the Community," formed one of the outstanding features of the opening session of the convention. While an able paper on "Methods of Infection and Disinfection," by Dr. W. A. Lincoln, and an address on "The Veterinarian in Relation to Public Health," by R. C. Duthie, V. S., D. V. S., Health of Animals Branch, Department of Agriculture, Dominion Gov-

External Trade Shows All Round Improvement

ANADA'S external trade is showing greater activity this year than in last, according to figures compiled by the Dominion Bureau of Statistics. They indicate that during the five months of the fiscal year, ending August 31, Canada's exports reached a total value of \$386,226,799, as compared with \$316,640,668 over the same period of the preceding year. Similarly, the total export business for the twelve month period ending August 31 reached \$1,001,037,574 as compared with \$779,467,399 for the twelve months immediately preceding.

Canada's total imports for the five month period were \$392,979,117 and for the twelve months \$891,891,035, the figures for the five and twelve months of the previous fiscal year being \$303,597,326 and \$732,391,895 respectively.

In the matter of duties collected, the proportion of increase is comparatively similar. Collections for the five months ending August 31 were \$57,712,148 as compared with \$55,516,217 for the same five months of the preceding year. For the twelve months ending August 31 the total was \$135,987,445 as compared with \$127,484,256 for the preceding year.

ernment, formed important items of the same session.

On the following day, a number of equally interesting topics were dealt with, among them being: "A Triangle of Inspection," by C. C. Thom, B. A., M. Sc., chemist and bacteriologist, Union Milk Co.; "Some Causes in the Spread of Infection," by A. Wright, sanitary inspector, Prince Albert, Sask.; "The Activated Sludge System of Sewage Disposal," by G. Purden Head, provincial sanitary inspector for Alberta.

FRAUD CHARGE DISMISSED

Toronto, Ont.—George L. Rapier and William A. Wineberg were defendants in a recent court action here, charged with obtaining \$50 by fraud from Herbert Carter, of the Carter Welding Co., they being supposed to have sold the sole Canadian rights of an aluminum solder to a number of people, each at \$50. The case was dismissed, evidence not being available to prove the sale of "exclusive rights."

OBITUARY

Montreal, P. Q.—Edward A. Tait, a retired steel manufacturer of this city, passed away in New Rochelle, N. Y., following a brief illness. He was 59 years old and had been visiting friends in that city when taken ill.

DISGUSTED

Peter and John (seeing a large plate-glass pane put in): "We may as well go home. They are not going to let it fall."

MIRRORS NOT NEEDED

"I do not see a single mirror in your house."
"What is the use? We have floor varnish."

PA HAD BEEN THERE

Little Willie: "Say, pa, what is Paris green?"

Pa: "The average American tourist in France, my son."

TOO GOOD

"Am I good enough for you?" sighed the timid lover.

"No," said the girl candidly, "you're not, but you are too good for any other girl."
S. E.

GETTING EVEN

Wifey: "This book says that men grow bald because of the intense activity of their brains."

Hubby: "Yes, and I suppose women have no whiskers because of the intense activity of their chins."—S. E.

SARTORIAL

"Did you ever try a London tailor, Binks?" asked Witherbee.

"Yes—once, but never again," said Binks, "why, Bill, I don't believe one of those London tailors could make a coat of paint fit a hen-coop."

FOLLOWING INSTRUCTIONS

Mike was passing Pat's house and saw Pat painting his home on a hot summer day with three heavy coats on. He asked Pat if he was cold and Pat said: "No, but the color card said to put on three coat to get the best results."

METHOD IN HER MADNESS

Oh, rouge is red and powder's pink,
And when these's things Sal's face encase,
They serve the damsel's purpose well—
In staving (?) off a homely face.

SOME GRAMMAR

Prof. Abraham Lincoln Williams: "Ulysses, am pants a common noun?"

Ulysses S. G. Adams: "Pants am an uncommon noun, Professa."

Prof. A. L. W.: "How come—uncommon noun?"

U. S. G. A.: "Becos, Professa, pants am singular at the top an plural at de bottom."

THE REASON WHY

A little boy asked his father, a confirmed dyspeptic: "Dad, did Moses suffer with indigestion?"

"I am sure I don't know," snapped his father, whose temper was rather soured by his infirmity.

"Well, I think he must have had it, for our teacher told us on Sunday that God gave him two tablets."

A GOOD REASON

Sympathetic Visitor: "So sorry, Johnny, that you had toothache yesterday. Has it stopped aching now?"

Johnny: "Don't know. The dentist kept it."

NO CAUSE FOR ALARM

He: "I just read an account of two girls getting lost in the Alps in mid-winter."

She: "Terrible! Were they frozen?"

He: "No, they warmed themselves on the mountain ranges."

NOT FIT COMPANION

Mother: "Tommy, you must not use such dreadful language."

Tommy: Well, Mum, Shakespeare uses it."

Mother: "Then you are not to play with him any more. He's no fit companion for you."

ABUSED

He struck her, but she uttered not a sound. He struk her agen butt no wurd eskapt her lips. Once moor he hitted on the hedd brav thing that she wuz, she did not even wimpurr. Then enraged beyond awl reezon at her unconcern of his akshuns, the brute uttered a lo oth and began raining bloo after bloo on her prettee little hedd, even skratcing hur in his maduus. Even thru this she had reamined silent. Butt finelly, not being able to stand it any longer, she heeved a reluctant sputter and berst into flame.

For yu sea she wuz only a match.

ACCOUNTED FOR IT

"Have you seen anything of that plaster of Paris I brought home yesterday?"

"Was it stuff that looked like flour, in a paper bag?"

"Yes, that's it."

"And does it get hard when it is wetted?"

"Yes."

"And sticks to everything like glue?"

"Yes."

"Oh, Joseph! It is just like you to leave horrid stuff like that lying about. Why, it took me more than half an hour with the hammer and chisel to get the cake out of the baking-tin."

Following items are reproduced from MacLean Pub. Co., trade paper files of September, 1903:—

"Stevenson & Malcolm, recently with Bennet & Wright Co. Ltd., Toronto, have started in business in Guelph, Ont., and have several heating contracts calling for 'Safford' radiators."

"One of our visitors a few days ago was W. J. Burroughes of London, Eng. About ten years ago he was one of the best-known master plumbers in Canada, having his headquarters in Toronto. He was instrumental in starting the National Ass'n. of Master Plumbers."

"H. A. Knox, Ottawa, secretary National Master Plumbers' Ass'n., reports the organization of local associations in Victoria, B.C., and in Sherbrooke, Que. J. Brown is president of the Sherbrooke association, with R. Sampson secretary, and including A. R. Wilson, Complin & Delorme, O. Trudeau, J. O. Brousseau and P. Lebreque."

"The semi-annual convention of the Ontario Ass'n. of Master Plumbers is to be held in Toronto on Thanksgiving Day, October 15. President Mansell had his sub-executive committee together this week."

"A friendly baseball game took place between teams representing the president and first vice-president of the Toronto Master Plumbers' and Steam Fitters' Ass'n. at Woodbine Park. President Ross selected his team from the west end of the city, the personnel being Messrs. McPherson, Jas. Powers, Maxwell, Benson, Robinson, R. Harrison, Torpy, Jessamine and Boddington. The vice-president's team was chosen from the east end, including R. Wright, M. Mullen, Menzies, J. Fullerton, Lyndon, Allison, Cooper and Thompson. The game resulted in a tie, 24 all, which will be played off later."

Catalogs and Booklets

Those interested in any of the catalogs described below can procure a copy of the same by writing direct to these firms. Mention that you noticed this in Sanitary Engineer.

PLUMBING AND HEATING SPECIALTIES CATALOG

A new catalog, No. "A," has just been issued by W. H. Cunningham & Hill, Ltd., 269 Richmond St. West, Toronto, which covers completely their wide line of high-grade plumbing and heating specialties and tools. This volume contains sixty-four pages, each article being illustrated by a clear and well defined cut, which is accompanied by a complete description.

This catalog takes the form of a combined catalog and price list and is arranged as nearly as possible in alphabetical order, making same a handy and quick reference both as to prices and goods which may be obtained from their stock.

EAVESTROUGH, CONDUCTOR PIPE AND FITTINGS

A new catalog has been issued by Wheeler and Bain, Limited, 179 King St. East, Toronto, which contains forty pages, and which covers a complete line of eavestrough, conductor pipe, conductor pipe fittings and roofing specialties, as well as many other lines of sheet metal requirements.

The size of this volume will allow of its being carried in the pocket, or it can be hung up by the string hanger. This catalog is well bound and will stand much usage.

A table of weights covering sheets is contained, as well as instructions for estimating corrugated iron jobs.

A valuable addition to the contents of this booklet is in the fact that it contains a list of prices and illustrations covering a full line of tin stock for heating work.

DATA BOOK AND STANDARD SPECIFICATIONS

A new book has been issued under the name of Data Book and Standard Specifications by the Duro Pump & Mfg. Co., of Dayton, Ohio, and which is being distributed by Empire Brass Mfg. Co., Ltd., of London and Toronto. The information contained in this volume is primarily designed to give essential and authentic information concerning the specification and installation of water supply systems, pumps, pneumatic pressure tanks and filters. This new book includes the following headings: Accessories, Booster Systems, Deep Well Pumps, Electrical Data, Foundation Plan, Friction Table, Pit Construction (waterproof), Shallow Well Pumps, Specifications (standard architect), Tank Discharge Between Pressures, Water Filters, and How to Compute Water Requirements.

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

BUSINESS conditions have shown improvement during the past two weeks, this being most noticeable in heating lines and repair work. Furnace and stove dealers report very good trade all year, up until the present, and in most cases substantial improvement has been noted over last year. A very optimistic view is taken regarding this trade during the remainder of the Fall, now that the coal situation has been settled, and as a good supply of coal is almost sure to be obtainable. Good trade in furnace and stove repairs has started and it is felt that a few more days of cold weather

will stimulate this line of business to a great degree.

A fair number of changes have occurred in prices since last issue of Sanitary Engineer. Range boiler prices declined, standard boilers now selling at 45 per cent. off list, in Toronto and Montreal; some lines of power washing machines also have declined.

An advance is announced in prices of wall and floor registers, and black sheets as well as scrap materials are also slightly higher.

Montreal Markets

MONTREAL, Sept. 29.—Dealers report that business conditions are much improved over those existing two weeks ago, and sales are reported to be most encouraging. A decline is noted in the price on enamelled ware, which is now being quoted at 35 per cent. off the list. Range boilers are now quoted at lower prices. A new discount of 45 per cent. is being quoted on standard boilers, with the exception of the 30 gallon size, which is selling at \$9.50 net. Extra heavy are quoted at 40 per cent. off the list.

Dealers in radiators and boilers state that business at the present time is exceptionally good and prospects for a good fall trade are very encouraging. The ingot metal market has hardly maintained the firm tone already shown, with the exception of tin, all lines showing a slightly lower tendency.

LOWER PRICES ON RANGE BOILERS

New and lower prices are now issued on range boilers. A new discount of 45 per cent. is now in effect on standard boilers, with the exception of the 30-gallon size, which is now selling at \$9.50 net. Extra heavy are now quoted at 40 per cent. off the list.

BRISK TRADE NOTED IN RADIATORS AND BOILERS

Montreal.

Dealers in radiators and boilers state that business at the present time is exceptionally good, and a large volume of trade in this line is anticipated this fall. Business in this line is said to be in a very healthy condition at the present

time. Prices remain unchanged and are in effect locally as follows:

RADIATORS AND BOILERS—

Radiator list prices are for 1, 2, 3, 4 and 5 column radiators, per sq. ft.

45 in. to 38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60. Discount 44 per cent for hot water, and 45 per cent. for steam.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05; Discount 41 per cent.

Boilers—Round hot water boilers, sizes from 0 to 10, 52 per cent. off list. Square or sectional hot water or steam boilers, 15 in., 3 per cent. with Ontario Government trimmings, list. Square or sectional water boilers, 19 in. to 36 in., 8 per cent. Square or sectional steam boilers, 19 in. to 26 in., 6 per cent. Ontario Government trimmings, list plus 7 per cent. Square or sectional water or steam boilers, 48 in., list plus 10 per cent. With Ontario Government trimmings, list plus 18 per cent.

Round steam boilers, standard trimmings, 16 per cent. Ontario Government trimmings, 13 per cent.

F.o.b. Montreal, Toronto, Guelph.

COMPRESSION GOODS ARE SELLING IN GOOD VOLUME

Montreal.

Quotations on compression goods remain steady after the recent reductions in some lines. Dealers report that sales are showing considerable activity, and still better business is anticipated in the near future. Quotations in effect locally are as follows:

SCRAP MATERIAL MARKET SHOWS IMPROVEMENT

Montreal.

Scrap materials are moving a little more actively, especially during the past week. Dealers are becoming more op-

timistic and better business is expected in the near future.

Prices are low and dealers see no reason why business should not go ahead as soon as a demand for scrap is felt. Current prices are as follows:

SCRAP—

Automobile Tires.....	0 50
Rubber Shoes.....	0 02
Yellow brass.....	0 06 1/2

SALES IN METAL LATH ARE GOOD

Montreal.

Sales in metal lath are reported by dealers to be quite seasonal. Prices remain firm and fail to show any tendency to deviate from the following:

METAL LATH—

	per sq. yd.
Painted—	
26 gauge.....	23c.
24 gauge.....	25c.
32 gauge.....	32c.
Galvanized, 5c. per sq. yd. extra.	

Stove Sales Increased 48 Per Cent.

SALES of stoves and furnaces for this year have been very satisfactory, and with most firms business in these lines has shown much improvement over last year's sales, which sales as a rule ran slightly over those of 1921. One firm in Ontario informed Sanitary Engineer during the past week that, from the first of this year to the first of September, their sales had increased to the extent of 48.02 per cent. over those of last year during the same period.

The stove and range business is now distributed mostly throughout the rural districts with very few coal-burning ranges being sold in the cities. Large numbers of Quebec heaters with ovens are, however, being sold in the cities as well as in the rural and country districts.

The increase in the furnace business has been particularly noticed in reference to sales made in the large towns and cities. Stove and furnace dealers

have not received very much business from the West as yet, but a good late fall trade is anticipated from the Western provinces as a result of the exceptionally fine crops being harvested this fall.

The stove repair business has been very active this year, and a good demand for parts has been felt, though the demand for these lines is not quite up to the exceptional call that was made on these lines two years ago.

Reports go to show that the sale of large steel ranges for the rural districts has dropped off considerably, due to the high cost of these ranges and to the fact that a number of second-hand ranges have been put on the market in exchange for the tortoise type of cook stoves.

On the whole manufacturers of stoves and furnaces are well satisfied with prospects for the future, and believe they are entering on a steady run of business for some time to come.

WROUGHT PIPE PRICES ARE FIRM

Montreal.

Prices on lapweld and butt weld pipe remain firm. Sales in this line are reported as being quite good, with prices still being based on price list No. 59, which was issued some time ago.

WROUGHT PIPE

Price List No. 59. April 24th, 1923.

Blued 60s	6 00

WEAKNESS NOTED IN INGOT METAL MARKETS

Montreal.

The metal markets have hardly maintained the firm tone recently shown, with the possible exception of tin. Copper

continues weak and other lines show a slightly lower tendency.

TIN.—After the sharp reaction which occurred last week a recovery took place, and there are rumors of heavy buying in London by a New York syndicate. The general tone remains strong, and higher prices are expected. The local market is firm at 47 1/2 cents per pound.

COPPER.—This metal continues to decline both in London and New York and prices have receded to the low levels of the early months of the year. Support appears to be lacking, and in the absence of any inquiry for domestic consumption, prices are apparently allowed to drift. To what extent this will go is difficult to say, but copper is now at a very attractive level as a purchase. The local market is quiet at 19 1/2 cents for electro, and 19 cents for casting.

LEAD.—The New York market remains steady, but London has declined somewhat, owing to heavy arrivals there. There is no marked tendency in either direction and prices are likely to change very little. The local market is quiet at 8 cents per pound.

ZINC.—The American market is sagging slightly, but this is probably only temporary, and as soon as European buying assets itself there will probably be a recovery in price. The London market remains fairly steady, but naturally they are desirous of buying at as low a price as possible in the U. S. A. The local market is quiet at 9 1/2 cents per pound.

ANTIMONY.—This metal is very dull, and demand is conspicuous by its absence. Local prices are unchanged at 8 1/2 cents for English, and 8 cents for Chinese.

Toronto Markets

TORONTO, Sept. 29.—Local dealers and jobbing firms have noted an improvement in trade during the last two weeks. Firms manufacturing stoves, heaters, and furnaces, report that trade has been much better than last year, one manufacturer reports a 48 per cent. increase up until the present time. Fall prospects are very good for the stove and furnace repair trade.

New and lower prices are in effect on range boilers, some lines of power washing machines and also on pig iron. Price advances are announced on wall and floor registers, black sheets and some lines of scrap materials. New discounts have been issued on several types of pumps.

Good trade is reported in asbestos lines, some firms being very busy on heating plant and pipe covering contracts.

Local collections have undergone a slight improvement.

BLACK SHEETS AT SLIGHTLY HIGHER PRICES

Toronto.

The prices on black sheets have advanced to the extent of about 15 cents per 100 lbs.

Basic cost prices have not changed to any great extent, but the elimination of price cutting on these lines which has been going on for some time, and a good demand being in existence for black sheets, is given as the reason for the stiffening in prices. The new prices are given as follows:

TANK STEEL PLATES—

1/4-in. and heavier, base	3 60
3-16 in.	3 95

BLUE ANNEALED SHEETS—

10 gauge, base	4 50	4 60
12 gauge	4 55	4 65
14 gauge	4 60	4 70
16 gauge	4 65	4 75

BLACK SHEETS—

18-20 gauge	5 45
22-24 gauge	5 50
26 gauge	5 55
28 gauge	5 65

A charge of 25c per 100 lbs. is made for less than case lots. An extra 10c. per 100 lbs. is also charged on sheets 26 in. wide.

ADVANCE IN PRICE OF SIDE WALL AND FLOOR REGISTERS

Toronto.

Floor registers, japanned and common oxidized, which have been selling at 35 per cent. off standard register list for sizes 12 x 15 inches and smaller, have been advanced in price. The discount now in effect is 30 per cent. off

list on these sizes. Larger sizes than 12 x 15 inches take a discount of 35 per cent.

The discount now in effect on side wall registers in above finishes is 30 and 15 per cent. off list.

LOWER PRICES ON SOME POWER WASHERS

Toronto.

Lower list prices are now in effect on Dowsell-Lees electric washing machines, Seafoam and New Century. The Seafoam washer is now listed at \$90 each, and the New Century at \$115 each.

Discount from these prices 25 per cent.

Maxwells have announced a new discount of 30 per cent., which applies to electric and engine driven washing machines, included in their list No. 71, to be effective at once. Prices to be in force after Jan. 1, 1924, will be announced at a later date.

NOTICEABLE DECLINE IN PRICE OF RANGE BOILERS

Toronto.

During the past two weeks prices have been in a very unsettled condition as regards range boilers. This condition was brought about by some price cutting which was going on among manufacturers of range boilers. Prices are somewhat settled now and have been

Copper Selling Below Lowest Production Cost

Copper Production Dependent Largely Upon European Conditions—Little Future Buying Being Done Despite Low Prices

THAT the copper market is very uncertain at the present time, with prices lower than production costs information secured by Sanitary Engineer from C. J. Marsh, vice-president, Standard Underground Cable Co. of Canada, Ltd., Hamilton, Ont. Ordinarily under these conditions large orders would be placed for future delivery, but it is significant that this plan is not being followed. Possibility that the market might remain as it is for some months or reach even lower levels, was pointed to by Mr. Marsh.

European countries were said to be the largest users of copper, and European conditions were governing the world copper situation very largely at present. Were conditions in Europe to show considerable improvement, copper prices would probably react.

While Western conditions have not been favorable in this line of business

since 1920, Mr. Marsh is of the opinion that a considerable improvement is now taking place. He believes that even if a comparatively high price is not secured by Western farmers for their crop, that the monetary value of the crop distributed throughout the sparsely-settled districts of the West should bring about lessening of the credit strain and improve business conditions.

Concerning the application of the new sales tax, Mr. Marsh pointed out that bookings for the new year were taken subject to tax conditions prevailing at that time.

There are two mills in Canada producing copper rods, one at Brockville and the other in B. C. Copper rods enter Canada duty free where they are to be used exclusively for wire and cable work, whereas ingots for tube and bar work are dutiable.

established at substantially lower levels than was the case when the last issue of Sanitary Engineer went to press. A new net price of \$9.50 each has been established on the 30-gallon standard boiler; on all other lines of standard boilers a discount of 45 per cent. is in effect, and on the extra heavy weight a discount of 40 per cent. has been made effective.

A net price list is given herewith which quotes the new net prices now being quoted to the trade.

RANGE BOILERS—	St'nd'rd	Ex. He'vy
5 gallon	7 43
10 to 15 gallon	7 70
18 gallon	8 25
25 gallon	9 08
30 gallon, special net price on standard	9 50	10 50
35 gallon	11 28	12 30
40 gallon	12 52	13 65
52 gallon	20 90	22 80
66 gallon	33 42	36 45
82 gallon	40 70	44 40
100 gallon	56 65	61 80
120 gallon	64 35	70 20
144 gallon	98 40
168 gallon	112 20
192 gallon	126 00
EXTRAS—	Add
For horizontal tapping	1 15
1" Special for gas heater	1 00
Each extra 3" tapping	3 00
Each extra 2" tapping	1 75

The above prices are net and are based on standard range boiler list. Standard at 45 per cent. off and ex. heavy at 40 off, with the exception of 30 gal. standard, on which there is a special net price of \$9.50.

PIG IRON PRICE DECLINES \$2 PER TON

Toronto.

The pig iron price is off \$2 per ton. The new price is \$31.30, in place of \$33.30, which has been in force during the last few weeks. This revision in prices to lower levels has brought out quite a volume of inquiries, which have been held back for some time. Requests for immediate shipment of orders indi-

cate that buyers have been holding off as long as possible.

Stocks are reported to be small and the continued high rate of output as compared with consumption does not tend to strengthen the price structure in any way.

PIG IRON—(Price per ton)—
In ordinary quantities 31 30

NEW PRICES ISSUED ON SOME PUMP LINES

Toronto.

New lists are issued on prices covering Maxwells' pumps, effective immediately.

List No. 202, covering pumps and dated June 15, 1923—Net list.

Hydro wing pumps—discount 10 per cent.

Prices on above lines to be in effect after the first of the new year will be issued at a later date.

SCRAP PRICES AFFECTED BY EUROPEAN SITUATION

Toronto.

Some lines of scrap materials have advanced in price during the last two weeks, higher levels being reached on steel turnings, No. 1 cast iron, stove plate, heavy lead, tea lead, scrap zinc, and rubber boots and shoes. Conditions at the present time in the scrap materials market are noticeably slow, as far as trading is concerned. Local dealers in these lines attribute this situation to the unsettled condition of political affairs in Europe existing at the present time. Dealers anticipate a further advance in scrap prices as soon as there is any direct evidence that a settlement is under way as regards occupied German territory. It is expected that this ad-

vance in prices will be of a general nature and that all lines will be affected.

Prices existing at the present time are as given herewith.

SCRAP MATERIALS— f.o.b. Toronto
Gross Tons—

Scrap Iron	
Heavy melting steel	11 00
Scrap pipe	7 00
Steel turnings	9 50
Malleable scrap	16 00
Rails, scrap	12 00

Car wheel (std.)	15 00
Scrap Metals	
Heavy copper wire	12 00
Light copper	9 00
No. 1 composition	9 00
Red brass turnings	8 00
Light brass	4 50
Heavy yellow brass	6 50
Heavy lead	5 25
Tea lead	3 25
Scrap zinc	5 00
Aluminum sheet and clippings	14 00
Aluminum cast	13 00
Hard lead	4 25
Scrap Rubber	
Boots and shoes	1 75
High rubber boots	1 50
Auto tires	0 25

GALVANIZED SHEETS SELL AT \$6.50 TO \$6.65 BASE

Toronto.

No changes are noted in the prices on galvanized sheets. A slight stiffening in basic markets has been observed recently, but it is evident that all of the metal purchased last winter is not consumed and some price cutting is still in existence. Current quotations are as follows:

SHEETS, GALVANIZED—		per 100 lbs.
Premier and Apollo Brands—		
Premier and Apollo Brands—		
10½ oz., 3 ft. wide	7 25	7 40
10½ oz. narrower	7 05	7 15
28 U. S. gauge, 3 ft. wide	6 85	6 90
28 U. S. gauge, narrower	6 50	6 65
26 U. S. gauge	6 20	6 35
22 and 24 U. S. gauge	6 05	6 20
18 and 20 gauge	5 90	6 05
16 U. S. gauge	5 75	5 90
12 and 14 U. S. gauge	5 60	5 75

F.o.b. and delivered in Toronto.

An extra 20c. per 100 lbs. is charged for Keystone and Premier brands copper-bearing sheets.

Long and Satisfactory Service is Assured with **JENKINS RADIATOR VALVES**

Fig. 490.
Steam Radiator.
Valve, Angle
screwed.

Fig. 493.
Hot Water Radiator,
Valve, Angle
Screwed.

Ordinary radiator valves cannot compare with these Jenkins models.

Made of virgin metal they are much heavier and stronger and embody the well known Jenkins Standard in design, material and workmanship.

These Radiator Valves can be supplied in either screwed or male union ends. The Angle Patterns, Figs. 490-1, are fitted with genuine Jenkins renewable composition discs for either steam or hot water service which ever may be desired.

The Quick Opening type, Figs. 493-4, which are recommended for Hot Water Heating only, are fitted with a plug or cylinder of suitable metal. Both types are equipped with polished, black fibre composition wheels.

Catalog No. 9—free on request—describes every Jenkins Valve in detail. May we mail you a copy?

*SMOOTH-ON No. 3 — for making
perfect screw-thread joints*

For _____

*if you fill in here
and return this tag*

SMOOTH-ON No. 3 is much better than ordinary screw-thread joint fillers.

Joints made with Smooth-On No. 3 stay tight because the metallic iron body can't dry out or shrivel from heat or time. Yet the joint can be taken apart if line changes become necessary.

In order that you may know this as well as we do, we urge you to fill in the tag as requested above and return so that we can send you the free sample.

You can get more at your dealers in 1, 5 and 10-lb. gray-labelled tins, or, if he is out of stock, send us his name and we will see that you are supplied.

The Canadian Asbestos Co.

STEEL AND IRON PRICES INCLINED TO BE WEAKER

Toronto.

There has been no shading in basic prices of iron and steel, notwithstanding the fresh weakness in the pig iron market during the past two weeks. Leading producers have not lowered any of their prices. Stocks in hands of consumers are reported to be low. Since Sept. 1 the volume of new business has shown marked improvement.

However, since the late spring, operations have been declining and are now about 75 to 85 per cent. of full capacity, as against 92 to 97 per cent. as was the case in the spring.

Orders are now obtainable from the mills from three to five weeks after placing, and production is still very much in excess of consumption.

PRIMARY INGOT METAL MARKETS WEAKER

Toronto.

The sudden drop in the London copper prices after the steady advances recently served to unsettle the market recently, served to unsettle the market a number of buyers to withdraw, some of whom were negotiating the purchase of fair tonnages. The result was that a very quiet market has supervened. Copper prices, though unchanged locally, are at a very low level but should any improvement occur in the Ruhr situation, better business is expected in basic markets as well as higher prices.

Lead, which has been weak of late, made a recovery this week and on Thursday, the 27th, was the only metal

that advanced in price on the London, Eng., market.

Local prices on all lines remain the same as formerly noted. Prices are given herewith.

INGOT METALS—

Copper \$18.00 to \$19.00; Tin \$45.00 to \$46.00; Lead \$8.00 to \$8.25; Spelter \$9.00; Antimony, \$8.25 to \$8.50; Aluminum, \$23.00 to 25.00.

GROUND KEY WORK SELLING BRISKLY

Toronto.

The existing prices and discounts on some lines of ground keys, etc., are given herewith:

GROUND KEY WORK—

Nos. 3954-3969	56% Off
Nos. 4031-4036	45% Off
Nos. 4043-4048	37% Off
Nos. 4049-4054	37% Off
Flatway stops, Iron Pipe, rough, No. 3968, ½ inch	0 77
Flatway stops, and waste, No. 3969, ½ inch	0 79

Winnipeg, Man.

WINNIPEG, Sept. 29.—Fall business is now commencing and dealers generally are looking for an improvement in all lines. The crop is now moving and it is having a stimulating effect in trade, as purchasers are buying in larger quantities. Prices which have been in effect for some time back have been maintained almost without exception during the past two weeks.

Collections also are showing a slight improvement.

AUTOMATIC FLUSH VALVES ADVANCE IN PRICE

Winnipeg.

A slight advance is recorded on Emco automatic flush valves. Size 1½ inch, for 3 stalls is quoted at \$8.75 each.

REVISION IN DISCOUNTS ON BRANCH TEES

Winnipeg.

There is a revision on discounts on branch tees, and quotations are list price plus 10 per cent.

COMPRESSION STOP COCKS TAKE LOWER LEVELS

Winnipeg.

Lower prices are in effect on compression stop cocks. Nickel-plated with cross handles are quoted at \$28.80 per dozen, less 42 per cent.

CORRUGATED SHEET PRICES REMAIN STEADY

Winnipeg.

Prices on corrugated sheets remain steady. Dealers locally report a fair amount of activity.

PIPE FITTING SALES CONTINUING STEADY

Winnipeg.

A seasonable volume of business is being done in pipe fittings with local prices continuing steady.

SEASONABLE DEMAND EXISTS FOR CLOSET GOODS

Winnipeg.

There is a seasonable demand for all lines of closet goods. Prices remain

BATH FITTINGS HAVING GOOD LOCAL SALE

Toronto.

Good sales have been made locally in bath fittings. Prices are as formerly quoted.

BATH FITTINGS—

N. P. brass handles or indexed, No. 3825	3 78
Indexed, china button, No. 3830.....	4 51
Deep Seal Por. S.N.P. traps, no vent....	3 55
Waste and overflows, 19 ge. 1½ in. T.B.L.	4 00
Do., 19 ge. 1¼ in. country	3 00

PLUMBERS' OAKUM HAVING GOOD SALES

Toronto.

The following prices are those being quoted to dealers at the present time on three lines of oakum:

OAKUM—	Per 50 lb. bale
Plumbers' Spun No. 1	3 20
Navy Spun No. 1.....	7 50
Navy Unspun No. 1	7 00

steady, no change having occurred during the last couple of weeks.

SOIL PIPE AND FITTING PRICES CONTINUE FIRM

Winnipeg.

Sales in soil pipe and fittings are reported quiet by local dealers. Prices show no tendency for any change.

TRADING IN RANGE BOILERS SHOWS IMPROVEMENT

Winnipeg.

The market continues steady, and trading is reported as showing an improvement. There are no changes in the quotations on range boilers.

SEASONABLE DEMAND FOR BOILER STANDS

Winnipeg.

There is a seasonable demand for range boiler stands and former prices in effect are well maintained.

EAVESTROUGH AND CONDUCTOR PIPE PRICES REMAIN STEADY

Winnipeg.

Sales in eavestrough and conductor pipe are reported quiet, and local prices remain steady, with no change noted.

PRICES REMAIN STEADY ON SHEETS AND PLATES

Winnipeg.

Prices on sheets and plates continue steady, and there is little tendency to deviate from present price levels.

Sanitary Engineer

Dominates in Its Field

Because—

SANITARY ENGINEER is the only plumbing and heating paper in Canada giving an up-to-date market service in each issue, from Montreal, Toronto and Winnipeg.

SANITARY ENGINEER has exclusive rights for publishing in the plumbing and heating field the splendid articles by Frank Stockdale, America's outstanding merchandising expert.

SANITARY ENGINEER uses more illustrations in the editorial section than any other Canadian paper in its field.

SANITARY ENGINEER is running the most complete and practical series on sewage disposal of any publication in Canada.

SANITARY ENGINEER is the only paper running in each issue a full page illustrated article on sheet metal work.

SANITARY ENGINEER is the only paper running a classified Buyers' Guide in each issue.

SANITARY ENGINEER runs the most up-to-date news service from coast to coast, outnumbering other publications in its field by more than five to one in the number of news items carried.

SANITARY ENGINEER'S editorial policies are conducted along sane, practical lines, based upon the experience of the very best authorities in their respective lines in Canada.

SANITARY ENGINEER is printed on better paper stock than any other paper in its field, thus showing up illustrations to better advantage.

SANITARY ENGINEER is uniform as to make-up, both in its editorial and advertising pages, thus making it convenient for readers.

SANITARY ENGINEER'S news of the trade, convention notes, convention reports, articles on legislation, are the brightest, breeziest, best-written and most complete reports issued to the Canadian plumbing and heating trades by any publication either in Canada or the United States.

SANITARY ENGINEER takes the lead in providing the trade with new, practical ideas, dealer helps, and proving through the printed word that certain plans are being carried out successfully by leaders in the industry.

SANITARY ENGINEER reaches the leading members of the plumbing and heating trade by paid invitation. Copies are not sent out indiscriminately. The paper is of real practical value to its subscribers, and they willingly pay a fair subscription price for it. This ensures reader interest and attention.

SANITARY ENGINEER carries in each issue a large volume of high-class advertising, and most of the representative manufacturers and supply houses use its pages regularly to carry their messages to the Plumbers and Sanitary and Heating Engineers of Canada.

SANITARY ENGINEER maintains, in addition to regular editorial and advertising staffs, correspondents located in the most important parts of Canada, and in this way provides readers with the splendid news service which is not duplicated by any other publication.

Subscription price, \$2 per year.

Any Plumber can interest a hot water user in a Mueller Auto- matic System of Hot Water Heat Control

THE automatic feature of this System, alone, is a powerful selling argument. Once connected up and placed in operation the System requires no further attention—the water is supplied automatically—the relief is automatic as well as the damper regulations. The householder keeps up the fires—the System does the rest. And here are a dozen other talking points.

1. The Mueller System requires no unsightly expansion tank, eliminating danger of freezing or overflow.
2. Can be installed in less than an hour on either old or new systems.
3. Maintains fresh water in system at all times.
4. Keeps system clean because of the rapid circulation due to pressure and fresh water.
5. Automatic damper control saves fuel.
6. Perfectly safe—impossible to have too high or too low pressure in the Mueller System.
7. The Reducing Valve and Relief Valve are positive in action, opening and working freely even after long periods of inactivity.
8. The water does not boil nearly so quickly as in the old type open systems with sluggish water.
9. Reducing Valve closes when the system is filled and the pressure reaches 10 pounds.
10. When the pressure reaches 25 pounds the Relief Valve operates, allowing a small amount of water to pass from the system.
11. Both of the above operations are automatic and take place without the attention or knowledge of the owner.
12. Being Mueller made, the system is thoroughly dependable—an absolute insurance of satisfaction to you and your customer.

For every water heating job —a Pittsburg!

AND one that will heat the water at the cheapest possible rate per gallon.

Whatever your customer's water heating problem may be, one of the eighteen different types and sizes of Pittsburgs ranging in capacity from 2 gallons a minute to 5,000 gallons an hour, is perfectly adaptable to do the job in the most efficient, most economical way.

And remember—every one of these heaters is made and guaranteed by the oldest and largest manufacturer of copper coil heaters in the world—each has features that can't be copied.

Every home—every apartment house, store and office building that is piped with gas is a prospect for a "Pittsburg."

*Babies
Fires
Accidents
Marriages
Deaths*

They are all news.

They are more than that. They are forerunners of business for someone. The baby-carriage manufacturer ought to know of every birth.

The builder, the brickmaker, the credit manager and the insurance company ought to know of every fire.

The cook-book publisher, the furniture man, the life insurance agent and the photographer ought to know of every marriage.

The tombstone maker and the worker in bronze ought to know of every death.

Every time something happens there is business for someone. Events even outside the narrow realm outlined have a special significance for you.

It is our business to keep you informed on news developments all over Canada affecting you or your business.

Let us outline a press clipping service that will help you. Charges moderate. Service efficient and speedy.

STEAM HEATING For Town and Country Homes

Dunham Packless Radiator Valve.

Users of Dunham Heating often remark, "Zero or below has caused us to appreciate still more our Dunham System."

Dunham Radiator Trap.

The DUNHAM
REG. TRADE-MARK
HEATING SERVICE
(MADE IN CANADA)

THE merits of Dunham Steam Heating in large buildings have been universally recognized. Contractors recommending and installing Dunham Steam Heat in homes do so because it provides the same characteristic services:

Simplicity in operation. Quick response to changes in outside temperature. Individual radiator control with Dunham Packless Valve, which admits as much or as little heat as required. Freedom of circulation through each and every radiator, insured by the Dunham Radiator Trap, attached as an outlet on the radiator. No noise; no cold radiators. Ideal heat in spring and fall, when only a little fire is required and unsurpassed efficiency in bitter cold weather.

'Phone or write any Dunham office for information or assistance in putting your Dunham Steam System proposal before your customers.

A RANGE BOILER WITH UNUSALLY FINE FEATURES

BRAZED AND RIVETTED

Seams are heavily rivetted and carefully brazed. Metal of substantial weight and finest quality; thoroughly galvanized.

Costs a trifle more than an ordinary quality range boiler but well worth the difference. Gives a lifetime of service without repairs or replacements.

In a word, it is a "Toronto Hardware Manufacturing Company" Product, staunchly built, carefully tested and inspected, and worthy of our best traditions.

Are These The Opportunities You're Looking For?

Fan Heating and Ventilating Engineering is the pinnacle of all other forms of heating, and of all branches of steam fitting and sheet metal work. It prepares you for:

1. For Employers it enlarges their business opportunities 100%.
2. Employees it raises to Foremanship of a large shop.
3. Or as Designing Engineer of some large Heating Contractor.
4. As an intelligent Salesman of Heating Appliances.
5. As Chief Engineer with a Heating or Furnace Manufacturing Company.
6. Later a Consulting Engineer to Architects and Building Contractors, etc.

Which of These Are You Working for?

Full Information Free.

The Greatest Value Obtainable in Ceiling Plate

TOP VIEW No. 10.

Our No. 10 Split Ceiling Plate can be attached to mains and risers at the very last, and is not exposed during completion of a building on the floors, thereby making an attractive finish. Made in all sizes from 1-1 inch to 6 inches inclusive.

The No. 10-A Narrow Flange Plate is a steel hinged plate flange 3-4 inch wide. Highly finished. Especially designed for twin connection "narrow." Made in sizes from 1-2 to 2 inches inclusive. Write for catalogue showing our complete lines of specialties.

GEM NO. 4 AUTOMATIC AIR VALVE

The best brass possible to obtain is used and greatly preserved against corrosion from plating acids because they are nickel plated before being assembled. This valve is simple to adjust and works automatically.

Gem No. 4.

“What a Neat Looking Valve”

It looks good, this baby member of the Perfecto family—that is the first impression. And the goodness goes right through.

This new valve that opens and closes with one twist has these outstanding features of design and construction:

Read—

Shoulders on each connection prevent pipe from interfering with the barrel.

Body is threaded on the OUTSIDE.

Bonnet tightens down on a fibre gasket insuring a tight connection.

Cushion packing nut which is easily repacked.

Made of best quality metal mixture.

Parts are machined to gauge and are interchangeable.

Broached handle with curved top that holds no dust.

Neat in appearance and carries the same “Two-for-One” guarantee as the famous Perfecto Brass Goods.

Emco Exposed Fitting for Tiled in Baths

THE handsome design and finish of our B9751 makes this fitting a favorite where a high-class installation is required.

All exposed metal parts are highly polished nickel plated. This fitting has proven highly satisfactory where it is inconvenient to conceal the supply and waste pipes.

We have incorporated in this exposed fitting for tiled-in baths the quality of utility and beauty to such a degree that it is being used in the best installations in the homes of Canada.

Examine our B9751 at your jobber or write us for a trial order.

THE *Little Giant* PIPE WRENCH

Patented Feb. 4, 1913.

*“Gets in
the Holes
and Corners
Where You
Want It
to Go—Extra Husky
and Powerful for the
Every-Day Work.”*

Fellow Engineer

Have you seen the *Little Giant*—the wrench that saves time and barked knuckles; makes possible many short-cuts in piping layouts and reduces the repair and replacement cost of wrenches to the minimum?

It has three parts only, and the metal is perfectly proportioned, giving maximum strength. Each part is drop-forged, carefully heat-treated, and practically indestructible.

Two sets of teeth on the smaller *Little Giants* and four sets on the larger ones double or quadruple their service life.

We welcome your investigation of the record the *Little Giant* has already made in plants both large and small and will gladly mail you copies of letters telling just what users think of it.

Better still try one out in your own plant. Our positive guarantee protects you. Order through your dealer or direct.

The Delco-Light Line of Pumps is Complete

WITH a line of 26 styles and sizes of pumps for both deep and shallow wells, the Delco-Light dealer has a Delco-Light Pump to meet the requirements of every prospect. These pumps are made for 32 or 110-volt D. C. or 110 and 220-volt A. C. service, so as to suit the largest possible field of prospect.

For deep wells there are $\frac{1}{4}$ H. P. and $\frac{1}{2}$ H. P. pumps of the pitless weatherproof type. Both of these models are superior to any other deep well pump ever put on the market.

The shallow well pumps give automatic water supply of the most reliable kind.

All of these pumps are simple in design, one place to oil, no exposed moving parts. Well constructed to the Delco-Light high standards. Easy to install. Low in price.

Doesn't this line look like a good money-making proposition for the pump dealer or plumbing contractor? If you are interested, write the nearest distributor for full particulars.

Let's Warm Up Those Cold-Hearted Homes

Inquiries reaching me indicate that there is a whole lot of replacement business awaiting you heating engineers and steamfitters right now.

Many a home with a handsome "face" has a cold heart. I hear of numerous cases of chilly houses, and so do you. Seems to me that a little team-play will place Gurney Heating Systems in most of these buildings this Fall.

You know the Gurney reputation, won by over 80 years of close application to the Gurney ideal of satisfying service. And you know Gurney Products to be living right up to that reputation.

No hesitation about recommending a Gurney System, no matter what the heating problem may be, is there? I thought not. Then let's get together and sell Gurneys to those prospects of yours.

Write to me personally to-day. I've an idea I can give you some helpful suggestions on getting replacement business.

Yours sincerely,

Holt Gurney

Gurney

Gurney Furnaces for Steam, Hot Water and Warm Air
—Gurney Stoves for Electricity, Gas, Coal and Wood
are good products worthy of the Gurney name

The border shown above set off a recent Gurney advertisement that showed how "Gurney Twin" Hot Water Boilers solved the heating problem presented by a very luxurious, but cold, home. That Ad. said this: "If you, too, live in a cold house, get in touch with a good steamfitter or heating engineer and have him look over your heating system." What have you done to "cash in" on that advertising?

Gurney Heating Systems are the last word in efficiency, economy, and simple operation. The initial cost is soon repaid in fuel and labor saving, in satisfaction and comfort.

When writing us, ask for our booklets and catalogues on Gurney Boilers and Radiators.

Canadian Solid Vitreous Lavatories For Factory Wash-rooms

Taking for granted that at least one sanitary wash-room should exist in every factory building, there is a large sales field lying within range of the plumbing fraternity in the equipment of industrial buildings of all kinds in every community.

And wherever wash-rooms are installed, Canadian Solid Vitreous Lavatories will be found to be the most efficient, the most sanitary, the most attractive and the most lasting of any.

Their hard-burned all-clay body, vitreous through and through, ensures a lifetime of hardest wear; their shimmering white, adamant-like, glaze surface defies dirt or germs, being as smooth as a pane of glass and as easily kept clean as a china plate.

The ample slab, the roomy bowl, the quick-draining outlet, the luxurious whiteness and cleanliness of the whole fixture appeal to the workmen and encourage tidiness.

The unchanging endurance of the ware, its pre-eminent sanitary qualities and the ease with which it can be kept clean recommend it to the owner, and render not only lavatories, but closet bowls and other sanitary fixtures of Canadian Solid Vitreous ware superior for factories or institutions of any kind where hard wear is expected and received.

The "Glenhemp" battery illustrated is a suggestion of a very suitable factory installation. We can, however, furnish many other designs to suit any individual requirement or preference.

"More and Better Plumbing and All Branches of Trade in Accord"

Such is the Aim of New Plumbers' Organization Formed in Toronto, According to Chairman Major L. L. Anthes—Has Been Too Much of the Individual and Lack of Co-operation in Past, Says C. F. Rogers—Series of Meetings to be Patterned After Hamilton Organization

AN INAUGURAL meeting of an organization of sanitary and heating engineers in the city of Toronto was held last Wednesday evening. The gathering was attended by some forty or fifty members of the craft along with about twenty representatives of manufacturing, jobbing, and publishing company representatives. The plan was conceived by a number of members of the Toronto craft, after noting the success which had attended such meetings of the craft in Hamilton and steps taken to bring about this impromptu and somewhat spontaneous gathering to sound out the local plumbers and heating engineers as to their attitude toward a similar series of meetings in Toronto this winter.

A splendid dinner was served, during which there was much song singing. This was followed by one of George Baker's inimitable stunts dealing with the conduct of the average English coster at a show. K. B. Allison explained something of the nature which such meetings should take, the necessity for maintaining strict schedules of procedure. Roy Belyea then introduced the chairman of the gathering, Major L. L. Anthes, Managing Director Anthes Foundry Co. Mr. Belyea spoke as follows:—

"We have gathered here to try and draw the plumbing interests of the city closer together and thereby to make things better for the manufacturer, jobber and operator. Major Anthes is the proper man to lead any such movement. We understand a similar plan is working with 95 per cent. efficiency in Hamilton. We in Toronto have about 500 operators and the best we can boast of in an organization way is about 70. We can only get out of these organizations what we put into them, and by helping ourselves we cannot help but assist the other fellow, too."

Will Help Cause

Major Anthes upon rising was greeted vociferously and proceeded to address the meeting on the objects of the gatherings. "I was approached a short

time ago by some of the craft in the city," said he. "These craftsmen thought I was Moses who had come to lead them out of the wilderness of doubt. There is much doubt expressed in the newspapers about the honesty of plumbers and much doubt in the trade itself about certain things. It is unfortunate that many years ago the plumber got a bad name and to-day is suffering for it. This doubt is a slur on the plumbing profession and its personnel. The plumber as I have known him for 29 years has been to me a pretty good sort of fellow and my desire to-day is to do all I can to help the craft of this city to put their trade on a higher plane; to try and persuade the public to exercise more kindly feelings toward the craft and give the plumber the respect which is his due. The foundation of all health is sanitation and proper heating. Enough attention has not been given to the man who prevents disease.

"A few weeks ago I visited the plant of Page-Hersey Tubes, Ltd., in Welland, in company with members of the plumbers' organization recently formed in Hamilton. It was while on that visit I appreciated what could be done by such an organization, and the suggestion was then made that a similar movement could be put under way in Toronto. I decided I would do whatever I could, and we have now taken the first step toward starting such an organization. We will get working committees formed to make future plans. It is our feeling that we should have more plumbing and better plumbing and all branches of the trade should be in accord. We expect to have manufacturers and jobbers at future meetings to discuss their problems. We have all been too far apart."

organization, and the suggestion was then made that a similar movement could be put under way in Toronto. I decided I would do whatever I could, and we have now taken the first step toward starting such an organization. We will get working committees formed to make future plans. It is our feeling that we should have more plumbing and better plumbing and all branches of the trade should be in accord. We expect to have manufacturers and jobbers at future meetings to discuss their problems. We have all been too far apart."

Describes Hamilton Organization

C. F. Rogers, Hamilton, Ont., local manager Standard Sanitary Mfg. Co., gave a very interesting outline of the reasons for forming the organization in Hamilton after which the Toronto organization was to be patterned. Mr. Rogers in answering the points: What do we get out of it? Why do you hold such

MAJOR L. L. ANTHERS,

One of the prime movers in the new organization of Toronto plumbers.

A portion of the group of master plumbers, heating engineers, jobbers, representatives and manufacturers who gathered at Hunt's, Toronto, to lay the foundations of an organization of the city craft for the purpose of holding a series of educational meetings during the winter. At the left at the head table is seen Major Anthes, next to whom is Gilbert Shanks, of Shanks, Ltd., Scotland, who was the speaker of the evening.

meetings? addressed the meeting as follows: "The tendency in the past has been toward too much individualism in this industry. The manufacturer has said, 'I make good goods, I charge what I please for them, and it is nobody's business whether I make 10 per cent. or 100 per cent.' The jobber has said, 'I buy as cheap as I can and sell at as good a profit as my competitor allows.' The plumber and the journeymen express the same idea. I do not say that this is actually done, but there is a tendency toward this sentiment, and, while it may be right in some respects, yet it is all wrong, because the plumbing industry is interlocking."

Mr. Rogers drew attention to a chart which he had prepared showing various circles, one within the other. The smallest one represented manufacturers, next jobbers, next master plumbers, journeymen and the consumer.

"The manufacturer cannot increase his business without increasing the business of the supply house," he continued, "and similarly the supply house cannot increase business without increasing business of the master plumber, and the journeyman in turn gets more work, and we are all responsible to the consumer."

"Take the case of two faucets for instance, the one good quality, and the other containing less costly material. The good one at \$1 may, after two years, be as good as new, but the other one, which perhaps sold for 90 cents, has gone to pieces. The cheap one was an injury to the whole plumbing business. The master plumber who puts in 125 lb. valves where 250 lb. valves should be used injures the reputation of himself and the whole industry. The journeyman who puts a wrench on the wrong end of a 250 lb. valve, and strains it, injures his employer and the manufacturer."

Mr. Rogers proceeded to point out that from his experience in other organizations he felt that too many speakers adopt a "preaching" attitude, which makes the hearers antagonistic. This type of speaker, he thought, should be eliminated in such programs at plumbers' gatherings. He appealed for the elimination of the dirty story or anything of a similar nature which would tend to bring discredit upon the industry. Bearing out the point that from every speaker who tells of his own business problems and how he has met them, some point of interest can be taken by hearers, Mr. Rogers cited a recent address by Sir Joseph Flavelle to which he had listened. The speaker told of how he reserved every Saturday morning to go over statements of the business, so as to have an accurate knowledge of its workings. Mr. Rogers thought this a good lesson for other business men.

Showing how this plan had worked out in practice, Mr. Rogers briefly reviewed some of last winter's meetings of the Hamilton organization. He outlined how Mr. Martin Quinn, National Equipment Co., Toronto, had advised plumbers to raise their profession to the level of that occupied by lawyers, whose advice is taken strictly by clients who quite admit that the lawyer is a learned man.

Mr. Burleigh, H. Mueller Mfg. Co., had shown how the mills took in seven tons of brass at one door and turned out one ton of finished product at the other, pointing out that the price of a bibb could not be judged by the weight of metal in it. Mr. Rogers stated that for the coming winter a banker would address one meeting to show how plumbers could better use the facilities of the bank.

Getting Everyone Acquainted

"It is well to attend such meetings for the social advantages," continued Mr. Rogers. "It is well to know your com-

petitor. We broke up cliques and got the men well acquainted by shuffling two decks of cards, putting one set around the plates and handing out the others till the men were well mixed up. We follow closely to our schedule, starting meetings at 6 and being over at 8 p.m. Last winter, though the first season for the meetings, we escaped anything in the way of a deficit, and the plumbers have pledged their assistance for further series of meetings."

Gordon Stewart, secretary of the Hamilton organization to which reference has been made, and president of the Ontario Society, D. S. & H. E., spoke next, outlining further details. He pointed out how that while at first the plan as outlined by Mr. Rogers had seemed incapable of execution, they made a good try and succeeded in putting it across. Every plumber attending paid his share of the expense, and did his part in making the program a success. Strips of tickets for the whole series of meetings were sold before any program was put on. There was no connection between the organization and any other master plumbers' association. No place was provided on the program for open discussion, there being strict adherence to the program. He urged those attending such meetings to do so with an open mind and not to be critical.

"We are indebted to Mr. Rogers for the success of our meetings. He has given us wonderful help. He has that trait of knowing how these things should be done successfully, and nothing has been done haphazard with us."

Following Mr. Stewart's address, the speaker of the evening, Mr. Gilbert Shanks, was introduced by Mr. B. W. H. Cunningham, whose address is outlined elsewhere in this issue.

Takes Two Months to Make Ordinary Article of Sanitary Pottery

Educational Address on Sanitary Pottery Shows This Ware is Divided Into Three Main Groups—Earthenware, Fire Clay, and Vitreous Ware—Some Difficulties of Manufacture—Some Flaws Not Discovered for Long While

Address by GILBERT SHANKS, Director Shanks & Co., Barrhead and Kilmarnock, Scotland, before Toronto Master Plumbers

THE speaker of the evening at the inaugural meeting of the Toronto sanitary and heating engineers, was Gilbert Shanks, director of Shanks & Co., Barrhead and Kilmarnock, Scotland. Mr. Shanks was introduced by W. H. Cunningham of W. H. Cunningham & Hill, Canadian agents. Mr. Cunningham emphasized the important part played by sanitary pottery in the community life of the country, pointing out that few persons understood the characteristics of the three distinct classifications of such pottery. It was because of this lack of knowledge on the subject that Mr. Shanks had been prevailed upon to give the meeting the benefit of his knowledge of the subject.

In introducing the subject Mr. Shanks pointed out that it was a great honor to him to have such a reception as he had been accorded in all parts of Canada.

"My firm has always had a very close connection with the plumbing trade in the old country," said Mr. Shanks. "We have always endeavored to encourage the closest relations with our friends there and now that we are endeavoring to take our share of Canadian business it seems only right for me to come and make myself known to you.

"The founder of our business, my grand uncle, was a country plumber, a man of ingenuity and ambition and not satisfied to remain a small country plumber. So he started in to manufacture sanitary appliances. He managed to get some capital and along with my grandfather started the firm of Shanks & Co., sixty years ago. They had a great struggle. They had to use their 'Scotchness' to make it go financially. The business grew gradually, however, and to-day we have four plants including two potteries, employing over a thousand men and we trade all over the world.

Big Difference in Wares

"There is a big difference in these wares, they being divided into three main materials. We call them earthenware, fire clay and vitreous china. In this country earthenware is often referred to as china and fireclay is called porcelain.

"Earthenware is composed of highly purified clays. The main characteristic of the body is that it is porous. It is

made very thin, being about $\frac{3}{8}$ in. in thickness as a maximum. It is manufactured by the casting process and is a white body. The glaze put on is transparent and this kind of ware depends on the whiteness of the body for its color. It is not intended to resist hard usage.

"Fireclay is a yellow body and is porous. It is used chiefly for bath tubs and urinals in this country and you call it porcelain. This clay is not purified like earthenware and must be kept very open in manufacture. In fact to keep it well open it is mixed with sawdust which is ultimately burned out, leaving the fireclay very porous so it will be properly vented. It is the only ware practicable for the purpose outlined. It is very thick and the only thing to stand up in large wares. The glaze is opaque to give it a white surface on a yellow body.

"There is a semi-vitreous material on the market here, some lavatories being made of it. It is a cross between earthenware and fireclay. It is not vitreous but is also not so absorbent as fireclay.

Vitreous Ware

"Vitreous ware is made from the same basic material as earthenware but other materials are added to make it vitreous. It is white, and requires a very high temperature. The glaze is applied in the

firing process, substance being added to make it opaque. This gives it a white brilliant surface. It is quite a scientific problem to handle this ware, there being danger at the high temperatures. Vitreous china is the best form of ware that can be used. It is more costly but is much superior. The body of it is strong and not absorbent. It has heat and acid resisting powers.

"This is a difficult line of manufacturing to conduct. There must be a very delicate balance in the mixture of materials, the slightest fault being a serious matter. The firing of the pieces is also tricky, a much higher temperature being needed than for enamelled iron. Sometimes trouble caused by faulty material is not apparent until the article has passed through the hands of manufacturer, jobber and plumber and been installed for some time, and then everyone is blamed.

"It takes two months to make a piece of this ware from the raw material to finished product. You can make a brass faucet in two days, so you can see why sometimes there is delay in delivering this line of goods.

"I have heard it said that Canadians support Canadian industry first, and British products second in all their trade. I am informed that there is not enough pottery ware produced in Canada to satisfy needs. I might say there is plenty of very fine pottery to be obtained from our country. I have been amazed at the great progressiveness and obvious efficiency of this country. I think there are good prospects ahead. In our line I know that high standards of plumbing fixtures are being demanded on all sides. We feel our country can do business with such a progressive country as this. We need the trade. Affairs in our country are not too good. We have a million and a quarter unemployed. Overseas trade is our lifeblood. We cannot support our population on home grown food for two days a week, and there is only a two day a week volume of business as an outlet for home produced goods in our country. Our statesmen are trying to find ways to increase trade. Canada can do its share and will do it we believe because the word British has always stood for all that is strong and free."

GILBERT SHANKS

Big Progress in the Plans for Education of the Plumbing Apprentice

New Courses Outlined in Detail as Being Planned for Various Schools—Schedule of Hours for Instruction—Details of the Minneapolis System—Many Important Topics Considered

EDITOR'S NOTE: — Having been called upon by the chairman of the Apprenticeship Committee of the Canadian Society and the Ontario Society D.S. & H.E. respectively, for some further information concerning progress being made in other parts in connection with instructional courses for apprentices, Sanitary Engineer presents herewith some further information which has been specially secured from various sources, including officials of the National Trade Extension Bureau, concerning such classes:

THE Minneapolis course, to which reference was made in a recent issue of Sanitary Engineer, is conducted for apprentice plumbers, and is one of forty-six schools in operation in Canada and the United States. The Minneapolis plan was worked out by W. W. Hughes for the Minneapolis Association of Retail Plumbers; Wm. Redieske, secretary of the association; Dr. C. A. Prosser, president of Dunwoody Institute, and Charles R. Allen, of the Federal Board for Vocational Education. The Dunwoody Institute operates both the part-time first-year classes and the evening classes for the second and third-year apprentices.

"The plans of the National Trade Extension Bureau," states Mr. E. L. Bowman, educational director, "contemplate a campaign of publicity to master plumbers, apprentices, present and future, to parents of prospective and present apprentices, to journeymen, manufacturers and community organizations.

"We are engaged also in the preparation of standard instructional material in the form of lesson sheets for the use of all approved schools of plumbing. These lesson sheets will be 8½ x 5½ in. on the loose-leaf plan, and will be furnished at cost by the bureau. Along with the lesson sheets will be supplied a teacher's manual giving suggestions as to the best methods of presenting this material. To work out this instructional program, we are fostering the establishment of an experimental school in Evansville and another at a different point in Indiana where, with the co-operation of the local authorities, we can work out the best form of instruction for apprentice plumbers.

"A third phase of our work is connected with organization of community schools. Manuals for local instructors are being prepared on the following sub-

ASKS SANITARY ENGINEER FOR DATA

Editor, Sanitary Engineer,—

In your issue of Sept. 15, page 15, we noticed an item suggesting a scholarship plan for sanitary engineers. The writer is very much interested, being chairman of an Apprenticeship Committee, and wishes to get all the data possible in connection with the training of apprentices for the plumbing and heating trades. We have a training school here, but it is not working as well as we hope to have it. I would be glad to have details about the scholarship plan and any information about the Minneapolis course.

(Signed) Peter C. Ogilvie,
Montreal.

jects: Taking Stock of the Community, Directions for Finding the Facts Which Are Essential to the Proper Development of the Community Plan for Apprentice Training; Organizing the Controlling Bodies, the Setting Up of Joint Apprenticeship Committees and Advisory Boards Together With the Best Possible Control of the School by the Industry; Selecting and Registering Apprentices; Equipment and Texts for a Plumbing School; Choosing, Training and Keeping Instructors; Opening the School; Maintaining Interest and Attendance; and Testing Results. These manuals will be in mimeographed form and are being prepared as rapidly as possible."

To indicate how the Bureau intends to proceed in the experimental school in Evansville, a copy of the schedule prepared for guidance of the interested parties is reproduced as follows:

PROPOSED SCHEDULE

Evansville Experimental School for Apprentice Plumbers

1923-1924—

Nov. 1.—Begin part-time work for all apprentices not previously attending school.

Jan., Feb., 1924.—Employers choose boys whom they intend to make apprentices by June 1.

March 17, 1924.—Open first pre-employment school for prospective apprentices; closes June 13, 1924.

June 16, 1924.—New apprentices begin work.

July 14, 1924.—Part-time school for first-year apprentices begins.

Oct. 6, 1924.—First evening school for second and third-year apprentices opens.

The Minneapolis System

The schedule followed in connection with the Minneapolis plan for training apprentice plumbers is shown herewith.

SCHEDULE OF HOURS OF INSTRUCTION

Shop Work	Total	Pre-Emp.	I	II	III
Shop Construction	220	150	50	10	10
Repair Work (Lead Work)	180	30	30	60	60
Trouble Shooting	20	—	—	—	20
Tools and Their Care	10	10	—	—	—
Total Shop Work	430				
Related Work					
Arithmetic for Plumbers	80	30	40	10	—
Blueprint Reading	80	40	30	10	—
Science for Plumbers	100	50	30	10	10
Trade Press and Progress	20	20	—	—	—
Apprentice and His Opportunities ...	15	15	—	—	—
Conserving the Customer	15	15	—	—	—
Total Related Work	310				

First-year apprentices are required to attend school two half-days of four hours each for 45 weeks, or a total of 360 hours. Second-year and third-year apprentices attend a night school four hours a week for 25 weeks, or a total of 100 hours each year.

The unit on Repair Work in the table which follows includes soldering and the wiping of joints in lead pipe. It is intended that practice in joint-wiping be carried on by the apprentice outside of class.

Trade Press and Progress is intended to familiarize the apprentice with the history of the trade and the current development of it as shown by the trade magazines.

Conserving the Customer covers the means used to insure a satisfied customer, and to induce him to continue dealings with the master plumber because of the faithfulness on the part of the apprentice in caring for the customer's interests.

Following is the proposed division of time for the instructional subjects:

Subject	Total Hours	First Year	Second Year	Third Year
Science for Plumbers	60	45	10	5
Arithmetic for Plumbers	60	45	10	5
Blueprint Reading	60	45	10	5
Shop Construction	170	110	45	15
Repair Work	145	60	25	60
Trouble Shooting	10	—	—	10

THANKS SANITARY ENGINEER FOR INTEREST IN TRADE

Editor, Sanitary Engineer,—

Am in receipt of your letter and wish to thank you for your interest in the trade. As chairman of the Apprenticeship Committee of the Ontario Society I have been endeavoring to find the best way to get acquainted with the different apprentices in the province. I find it nearly impossible for me to get in touch with these apprentices and to know what is doing. We have in Ontario at present apprentices who are anxious to get along. We also have others. But I feel that if something could be done to further assist the apprentice who is both interested and ambitious, our efforts would be well rewarded.

Trade journals are a great asset to the trade, and I have often thought what a great help they could be made if linked up with this apprenticeship question. Now that we have your kind offer of assistance we must get down to a system.

Yours truly,

(Signed) W. Newell,
Hamilton, Ont.

PUBLIC LAVATORIES CONTEMPLATED

Toronto. — The commissioners of the Property, Works, and Parks Commissioners, are now working on a joint scheme of public lavatory accommodation, the proposal being to construct 24 new lavatories in various parts of the city, at a cost not to exceed \$300,000.

APPOINTED GENERAL MANAGER

St. Catharines. — A. M. Welsh, formerly secretary of the Imperial Radiator Co. Ltd., has been appointed general manager of the company, succeeding E. T. Wingate, who resigned a short time ago.

A neat-appearing shop front does much to influence women prospects who pass up the untidy shop with the feeling that a plumber who is not careful of his own premises will not be any more careful while working in the homes of others.

Heating and Ventilating Department

Results of Tests of Radiator Traps

Performance Data on Nineteen Radiator Traps Covering Venting of Air, Drainage of Water, Trapping of Steam, and Freedom From Noise

(Continued from last issue)

THE radiator is equipped with thermometers at the points indicated which give the surface temperatures of the radiator at those points. If these temperatures be averaged, we have the average temperature of the entire radiator surface. The average temperature of the entire surface, divided by the temperature of the incoming steam, gives what is called a "temperature ratio." (To make this ratio more exact for the purpose for which it is to be used, the room temperature is subtracted from the temperature of the incoming steam and from the average temperature of the surface of the radiator, before the above division is effected.)

It is obvious that if the air were not vented from the radiator, the radiator would not completely fill with steam and the average surface temperature would be much below that of the steam at the inlet valve. It is also obvious that if the water of condensation were not drained from the radiator, but filled the lower part of the columns, not only would the surface of the radiator be cooler where the water was so gathered, but also that such accumulation of water would obstruct the free flow of steam to the several columns (in the case of a radiator of the "Column-steam" type); and the surface temperature of the radiator would be lowered thereby. Accordingly, the above temperature ratio is assumed to measure the efficiency of the radiator in the performance of two of its duties, namely, the venting of air and the drainage of water.

Drainage of Water

As the steam condenses in the radiator, the water of condensation passes out of the radiator through the outlet. The outlet pipe and the last column of the radiator are cross-connected with a water-glass similar to that cross-connecting the inlet pipe and the first column, and adapted to show the water level at this point.

The trap that is being tested (G) is connected to the outlet pipe and functions in the usual manner. The water of condensation, draining through the trap (G), flows down through pipe (H) into the first of two water siphons (I).

The overflow from the water siphon (I) flows into the water siphon (K). The overflow from the water siphon (K) flows into one of the condensation pots.

It is obvious that the pipe (H) might connect directly with the condensation pots without the two intermediate siphons (I) and (K). But in such case there would be more or less of a flow of current of water which might carry with it some part of such steam as passes the trap. Accordingly, it has been found better practice to eliminate any flow or current by introduction of the two water siphons. These are filled with water at the beginning of the test. It is merely their overflow which passes into the condensation pots and is measured.

It will be noticed that two condensation pots are used. While one pot is receiving water from the radiator, the other pot is shut off and its contents drawn and measured, and vice versa.

Passing of Steam

Whatever steam the trap allows to pass (without trapping) rises through the pipe (L) into the condenser where it is collected and condensed to water. This water flows through the pipes (M) and (N) to the two steam-passed pots. One of these pots receives the water

while the other is shut off and its contents drawn and measured, in the same way as the condensation pots.

It has been found that some of the steam rising through the pipe (L) on the way to the condenser condenses before reaching the condenser. Nevertheless, it has passed the trap as steam and is therefore to be measured as steam passed. Accordingly, it must be conducted to the steam-passed pots, which is accomplished through the pipe (O) connecting with the pipe (N) above referred to.

The total amount of water collected both in the condensation pots and in the steam-passed pots (measured in pounds) is evidently equal to the amount of steam received by the radiator (also measured in pounds). The amount of water collected in the condensation pots alone, in proportion to that collected in both sets of pots, is obviously the percentage of steam which the radiator has condensed and which the trap has trapped until so condensed. It is the measure of efficiency of the trap in its duty of the trapping of steam.

Use of Vacuum Pump to Reproduce Service Conditions

In order to reproduce service conditions, it is necessary to provide a degree of vacuum on the return system.

Testing apparatus used for radiator traps.

This is accomplished by connecting a vacuum pump to an air line which leads to each of the steam-passed pots and the condensation pots. But such a vacuum applied to the condensation pots would obviously disturb the water siphons (I) and (K), and pull part of the water of these siphons into the condensation pots. It is necessary to balance this pull by one in the opposite direction. This is accomplished by cross-connecting the outgoing water line with the outgoing steam line by a section of pipe (P). The steam line (L) is under the same vacuum by reason of the vacuum pump connection with the steam-passed pots.

The degree of vacuum is measured and registered by a mercury gauge at the top of steam pipe (L). In the first set of tests, a vacuum of 10 in. of mercury was used; in the second, a vacuum of 0 in.; and in the third, a vacuum of 5 in.

Possibility of Re-Evaporation

The apparatus described, the report states, functions with reasonable exactness in all respects but one. That is what is called "re-evaporation." In explaining this the report states:

In the first set of tests, the pressure of steam in the radiator is at 6 in. of mercury (more than atmosphere). At this pressure, water condenses at a temperature of 221 deg. F. (instead of at 212 deg. F. when under atmospheric pressure). Let us assume some water of condensation at 210 deg. to pass the trap—as water.

This water, on flowing into the pipe (H), enters a partial vacuum represented by 10 in. of mercury (less than atmosphere). In this (partial) vacuum, water boils at 192 deg. F. It is obvious that the 210 deg. water of condensation entering this condition of (partial) vacuum, will boil. A certain amount of it will turn into steam, although it passes the trap as water.

This "re-evaporated" steam will ascend through the pipe (L), go into the condenser and so to the steam-passed pots. It will add to the amount of water measured there. It will diminish the proportion of water which is credited as condensed in the radiator.

There appears to be no method of avoiding this result, or of assuming with certainty and exactness how much re-evaporation takes place under any given condition. However, while some amount of re-evaporation might make an unfavorable showing for some one trap tested by itself, when a considerable number of traps which function in a similar manner are tested under identical conditions, the amount of re-evaporation may be supposed to be approximately the same in each.

To this view the report notes one line of exception. If one trap passes hotter water than another, it is more likely to give re-evaporation. And if a trap

Types of radiator traps which underwent test.

passes steam, this would mean that the water passed is hotter still, and there would be still more re-evaporation. In short, if a trap condenses thoroughly,

there will be little re-evaporation; if a trap does not condense thoroughly, the steam which passes is likely to be exaggerated by re-evaporation.

Heating Business is Brisk But—It Can be Made Brisker

Singleness of Idea in Trimming of Window Will Achieve Better Results than if a Number of Objects are Allowed to Produce Jumbled Impression on Passer's Mind

STOVE and furnace trade this fall is reported better from all sources and from every angle than has been the case for some seasons back. Dealers are of the opinion that for some little time back, people in need of new heating equipment have been postponing the purchase in the hopes of falling prices. Repairs have been made until at last the old equipment will stand the strain no longer and there is now no alternative for the householder other than to replace his equipment with new.

Since early in September the volume of stove and furnace sales reported has been heavy as a consequence, and from indications there is still a considerable amount of this business yet unplaced—business that will be spread out over the period from now until the flying of the snows of early winter.

If you are selling heating equipment, it is only natural to expect that a certain amount of this extra business is coming your way. However, if you are among the wide-awake merchants who believe in giving any seasonable sales movement whatever additional impetus may lie within their power, your share will be proportionately greater.

Looking through the daily papers, one finds but very little advertising dealing with stoves and furnaces. Very well then, what little there is will stand out

just that much better and will carry that much more value—if the advertising is of a desirable nature.

Take, for example, an interesting advertisement run recently by a stove merchant. In large letters running in three lines across the top of the ad was the announcement: "A New National Holiday for Women Has Been Declared."

Naturally, this striking lead creates an interest that will cause one to read the smaller type which follows, and in which the following copy is used: "At last a national holiday that can be celebrated 365 days a year. It means absolute freedom from kitchen worries and work. Come down to our store and learn more complete details of this holiday which goes hand in hand with the purchase of a ——— range."

This is a line of advertising which bids fair to touch the hearts and pocketbooks of those who have heretofore been all too neglectful with regard to the comfort and convenience of those who spend much of their time and energy in the kitchen.

This scheme of advertising brings to mind a thought which probably never occurred to a great many people and, therefore, it has utility value; it strikes in a vulnerable spot and stands a very strong chance of bringing direct results.

A Big Opportunity for Plumbers Installing Factory Sewage Disposal Systems

Sewers and Public Water Supplies Not Absolutely Necessary—
Private Systems can be Installed—Many Favorable Features for
Factories in Rural Districts—Details of a Successful System

Written specially for Sanitary Engineer by EDWIN NEWSOME, Consulting Sanitary
and Heating Engineer

TRADE SHOULD TAKE A VITAL INTEREST IN GETTING FACTORIES TO LOCATE IN RURAL TOWNS

Author's Note.—During the past three or four months the writer has visited over 100 towns and villages of from a few thousand to two hundred population. The question of securing or not securing suitable factory locations in such small towns has scores of times hinged upon the question of water supply and sewage disposal systems.

Sanitary and heating engineers can perform a splendid duty and at the same time procure some nice business if, when the question of water supply and sewage disposal systems is discussed, the sanitary engineer or plumber could suggest that the initial outlay for a private system can easily be arranged at a moderate cost and that such city conveniences can be procured at less actual initial outlay than if a public sewage and water system was installed on purpose to draw such an industry.

The trade should do their part in trying to encourage factories and other industrial plants to locate in our small towns and villages.

FROM time to time it has been said that such and such a firm "would not locate here because we have no sewers or water system." As a result, many a small Canadian town or village that would have been in a much more prosperous condition to-day has one or two factories.

Most of these small towns have lots of labor, lots of railway facilities, and in many ways would have been a good location for the establishing of manufacturing industries. But, as referred to above, "there were no main sewers, water supplies, etc."

This stand no doubt has been taken by the executives of many industries in ignorance that one or two wells could very often be drilled, bored or dug and a small pumping system installed at a moderate cost. The charges for a public supply would likely have been more than enough to warrant the outlay and prove in many cases a paying investment.

The sewage disposal problem, too, is one that is easily overcome and the cost of such a system would likely also prove a paying investment. There is no doubt whatever as to being able to construct a private disposal system, as is proved at least in one instance, described here-with.

It must be stated that the nature of this particular industry and the size of it did not at first call for a very elaborate system, and in this case there was a water supply service available. But, in the first place, a cesspool was installed and it began to cause trouble. Then, again, the plant was to be enlarged, which made it necessary to plan and lay down a proper sanitary sewage disposal system.

This installation was designed and put into use several years ago and it was built to take care of the sewage from plumbing fixtures to be used by about 400 employees. The ground available is, as can be seen, located on the bank of the Canagagique Creek. At some seasons of the year it is pretty full of water and the writer was informed that the sewage from the cesspool was at one time polluting the water in this creek.

How to Plan a System

There are quite a number of people who have the idea that the size of a sewage disposal system largely depends upon the number of w.c.'s and other plumbing fixtures there are in a building. This is not the case, and, furthermore, many plants established in rural districts would have had more fixtures installed had not this idea been in the minds of the executives. The result has been that only one set of toilet rooms has been furnished, very often in an out-of-the-way location, causing a big waste of time on the part of the employees because of their having to walk long distances to and from the bench or work table to the lavatory.

The size of a septic tank and sewage disposal system must be determined according to the number of persons employed, just as is the case with a residence. Sizes are always so arrived at. Then, again, the size of the septic tank, which, as a rule, has two compartments, is based upon the amount of sewage to be discharged by the syphon every twenty-four hours, which syphon is located in the dosing chamber. See Fig. 1.

The cesspool, which is shown in both the plan and elevation, was not in any way disturbed. The plant now employs upwards of 400 persons, which is almost equal to the population of a small town, and the system is working so well that when the writer called, several years after the work was completed, the engineer of the plant could not tell just where the pipes or tanks were laid, he not having been employed there when the disposal system was installed. This was at least one proof that the system is working O.K.

The size of the discharge or dosing chamber is, it will be noted (see Fig. 1), 20 feet long, 10 feet wide and a total depth of 3 feet 7 inches. The depth of the sewage, however, is only 2 feet 2 inches, this height being necessary to discharge the 5-inch syphon. It will, therefore, be seen that this chamber contained approximately 434 cubic feet of sewage, or about 2,620 gallons.

The Amount of Discharge

It would appear that the discharge of sewage would amount to 434 cubic feet. This is not so, as will be explained by referring to Fig. 2, which shows a larger view of that portion of the dosing chamber with the syphon in place.

The lower edge of the syphon bell is 3 inches from the bottom of the tank. Then there is a small syphon break at the side through which air is drawn. This operation will be explained later. The action of the syphon is stopped when the sewage is 4 inches deep. Thus, out of the whole 434 cubic feet, 4 inches of sewage is left in the tank, making the amount of discharge at each operation about 384 cubic feet. The operation was timed to take place in this installation once every 24 hours or thereabout, so that there would be approximately 2,500 gallons of sewage flushed into the disposal bed of field tile every operation. As the number of people to be employed was at that time about 400, an allowance of about six gallons per person per day was made, which, according to the way the system has worked, is apparently all that could be desired.

The size of the cultivating chamber is arrived at in the following way. First, having decided upon the water allowance

per person per day, it is very good practice to make the cultivating chamber about 20 to 50 per cent. larger. Now turn to Fig. 1 again. There are three compartments, but this would not occur in regular practice. As stated previously, there was a cesspool in use. This is shown in the small square compartment and it was not disturbed in any way. But, in arriving at the size of the receiving or cultivating chamber, an allowance was made for the already-existing tank and it was connected as shown. The total area of the two compartments, however, is equal to about 20 per cent. more than the discharge from the dosing chamber. The reason why it was only 20 per cent. larger was that the area in which the disposal tile is laid is made up of cinders from the boilers and railway cinders. Being 20 per cent. larger also permits of more time for the bacteria in the cultivating chamber to break up the solids.

To many there appears to be something of a mystery about what is going

on in a septic tank, therefore a little explanation will be of interest.

First, all manner of domestic waste, paper and excreta from w.c.'s, soapy water and greases, etc., flow into the cultivating chamber. Septic action, or a form of fermentation, takes place like brewing. The solids are broken up in this compartment by anaerobic bacteria, a germ which does its best work in a dark chamber free from light and air.

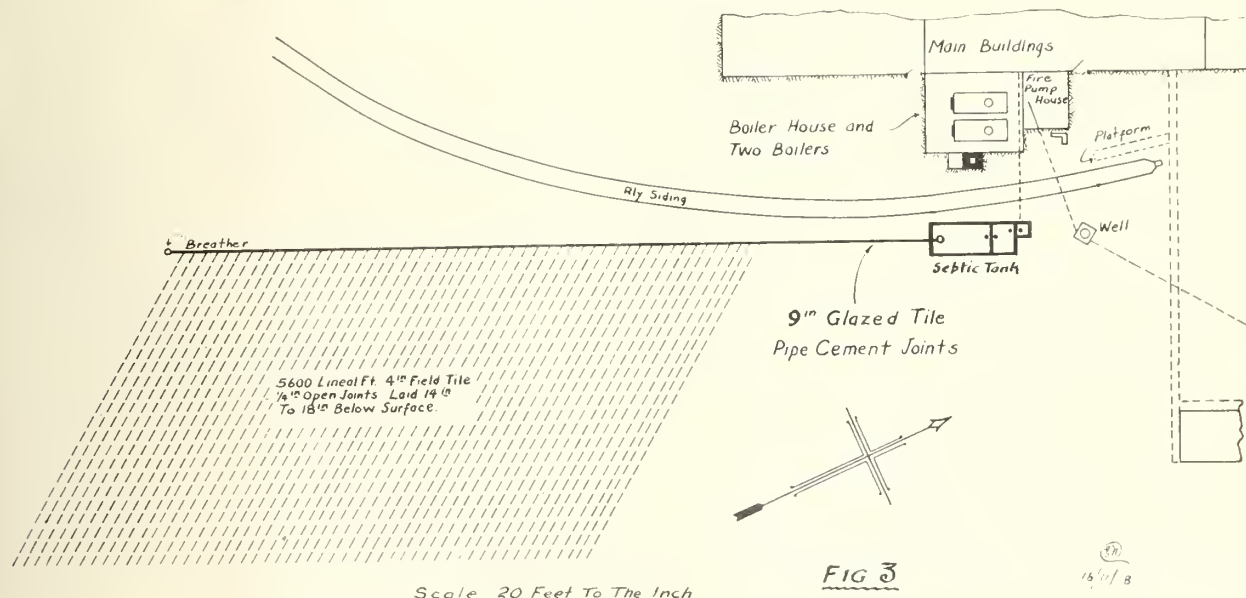

This anaerobic germ throws off carbonic acid gas, H_2CO_3 , and this gas must be carried off by way of the soil pipes which go up through the roof of the building. If the reader will note the complete plan, Fig. 3, and trace the pipe line from the end of the 9-inch main line, it will be found that the whole system is ventilated through this breather, so that no foul gases can accumulate anywhere in the system (a very necessary condition).

Now, the solids being all broken up, the effluent from the larger of the receiving chambers flows up through a pipe with a long leg into what is known as the dosing or syphon chamber. There is now little if any bacterial action taking place until the effluent is distributed into the field tile area.

Operation of the Syphon

Before allowing any sewage to enter the syphon or dosing chamber, the trap of the syphon must be filled with water; then place the bell on the top of the long leg and it will be found to be resting on the top, about 3 inches from the bottom of the dosing chamber. Having what is known, then, as "primed" the syphon, the whole system is ready for operation, that is, provided that the field

Complete Plan of Sewage Disposal System For Factory Employing 400 Persons

Tinsmithing and Sheet Metal Work

Skylights Over Garages and Power Plants Are Ever in Demand

The Working Drawing Shows How to Make a Pattern of a Skylight that Inclines Four Ways, With a Ventilator

Written for Sanitary Engineer by O. W. KOTHE, Principal St. Louis Technical Institute

TINNING shops doing tinning and plumbing have ample opportunity for making skylights in small villages over garages and power plants, as well as in cities. So here we take on a skylight that inclines four ways and has a ventilator of a rectangular design set in the centre and to which the various bars join. Now skylight work is simple in assembling and erecting, but the workman who has done little in the laying out of it, generally has considerable difficulty in understanding the various miters and positions used in the development. Much of this

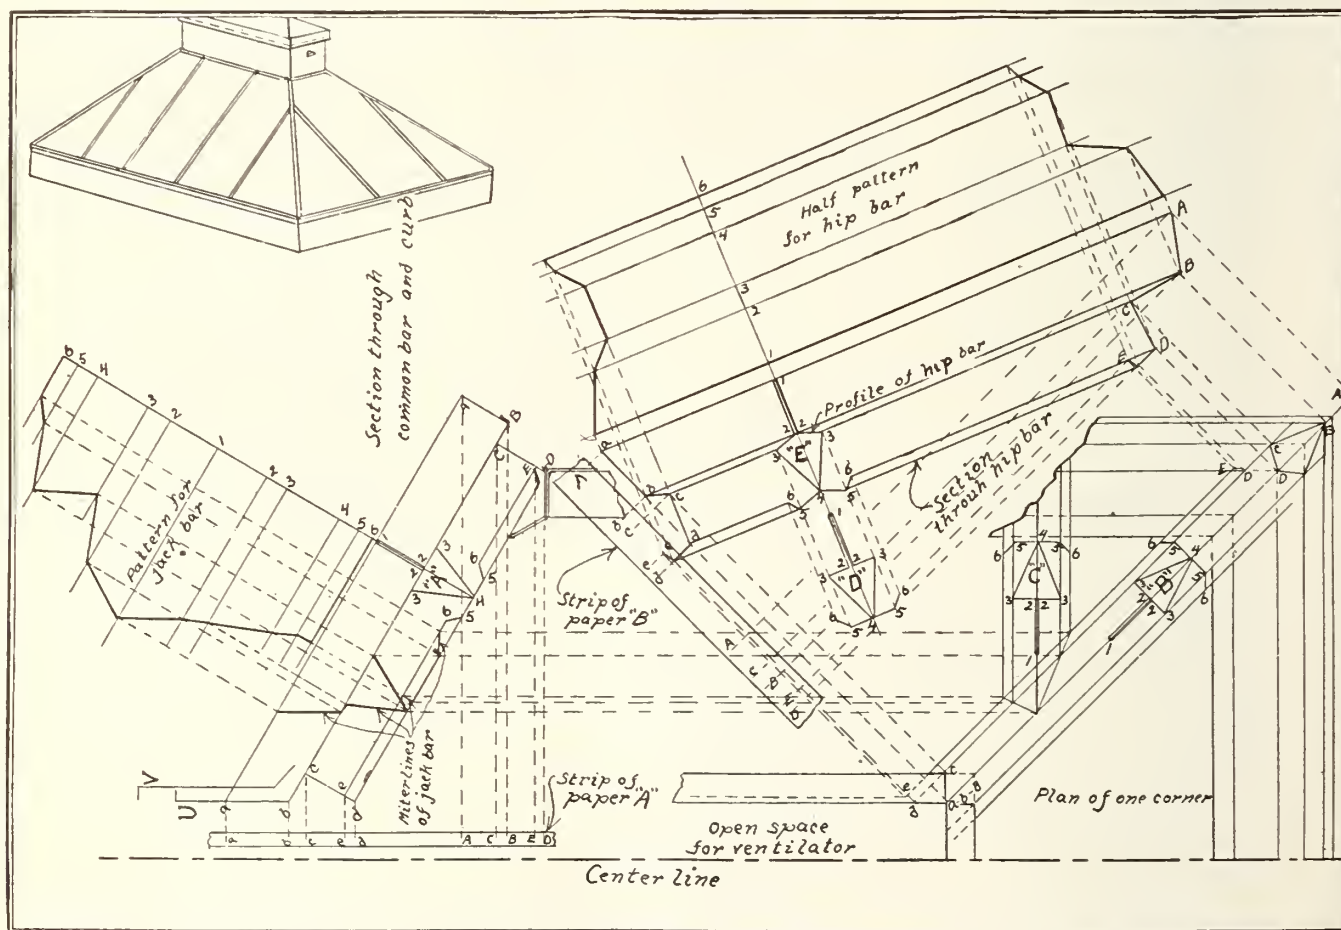

must be associated with the frame work on roofs of buildings, and when considered in that light, it should come easier.

We first draw the section through common bar and curb, making the pitch of skylight to a 30 deg. angle, as B-b. Then at right angles to it, detail the common bar "A," detail it so that it can be made out of the $7\frac{1}{4}$ in. strip of metal for average work, which enables getting four strips out of a 30 in. sheet. From each point as 1-2-3-4-5-6 in the section "A" extend lines both ways parallel with the line B-b. At a convenient place draw the upper ventilator bar U,

taking on the shape of the detail shown by a-b-c-d. Also detail the lower curb to the design you wish to make this and this gives the shape A-B-C-G-E.

We next develop a quarter plan of the hip, so we draw any line as A-a on a 45 deg. angle and from each point in the ventilator bar U, also from the lower curb, we drop lines indefinitely, to intersect this hip bar a-A. By this means, we draw the part plan of the curb and the ventilator bar. Next reproduce the detail "A" with all its points to the position of "B." Then from these points extend lines parallel to a-A until they intersect corresponding lines in the ventilator bar and the lower curb, which enables tracing the miter line as shown. These intersections are quite difficult to see through for a beginner, but the workman must watch his points and trace his lines of corresponding numbers until they intersect, and that is the only way you can draw the miter in the ridge and the curb. Observe

(Continued on page 27)

Garages and power plants in small towns, as well as other buildings requiring top ventilation, are frequently equipped with skylights of rectangular design. The tinsmith not familiar with all forms of mitering may save himself time and embarrassment by studying carefully the layout given.

Unusual Selling Stunts Are Put to Good Use by Maritime Plumber

Believes in Putting "Pep" Into Advertisements—Contrast With Usual Plumbers' Style Makes This Plan Very Effective

CHARLOTTETOWN, P.E.I.—Fred Trainor, a plumbing contractor of Charlottetown, has been conducting "A Bath a Day" campaign in and about Charlottetown. Mr. Trainor believes the early Fall period is the time to strike out for bath tub installations, and shower bath installations, so he has been concentrating on an advertising campaign, linking his watchword of "A Bath a Day," with his own business as a contractor.

Mr. Trainor has issued the little rhyme, which reads "A bath a day keeps you fit every way." He has been using this rhyme in most of his advertising and in conjunction with his slogan "Plumbing installed by Trainor is a guarantee nothing will be slighted."

The usual advertisement of a plumbing contractor is looked upon as a dry affair. A little more pep helps in this case. A little wit can work wonders frequently, as witness driving home the necessity of frequent baths, with the following joke:

Sergeant: "Did you take a bath to-day?"

Rookie Private: "No, sir. Is there one missing?"

An acrostic as part of an advertisement would add effectiveness to advertising, lending that singular touch. For instance, an acrostic composed as follows:

Plumbing that is flawless
Lengthens the lives of men, women, and kiddies.
Useless to say plumbing is unnecessary.
Medical men agree sanitary systems pay.
Baths daily are pep producers.
In hundreds of houses we have installed plumbing,
Naturally our experience is greatly in our favor.
Good plumbing is our motto.

In behalf of shower baths, a weather report style of advertisement can be inserted such as: "Weather Report for To-day—Showers in many homes of this city and suburbs, installed by — — the Plumber."

In this age of keen and abundant competition, the favor goes to those executing unusual ideas.

Plumbing has been considered a much too dry occupation in the past, despite the connection with so much water. With so many plumbing contractors in the field, it behooves all to digress from the beaten track and delve into untrod trails in order to attract attention and business. When a plumbing contractor buys advertising space in a newspaper he might better make the space a revenue-getter, than have it perform merely the function of adding to the coffers of the newspaper.

Sergeant—Did you take a bath to-day?
 Rookie—No, sir. Is there one missing?

Too Big a Difference

LARGE volume of consistent business at a small margin has been pointed to by business authorities as the palliative for many of the world's business ills to-day. There is a good deal of truth in it, too. These are times when people want value for their money. Value is being demanded in most cases of those who are employed by manufacturers in an endeavor that the manufacturer may be enabled to meet the keen competition of the open market in his product. The only way to successfully compete under such conditions is to exercise every plan tending toward more efficiency and to stimulate turnover so that the per unit overhead cost is reduced to the minimum. It is chiefly a case of the survival of the fittest and there is no place for the worker who does not earn his wage.

The building industry is a shining example of all that is the opposite to the desirable condition outlined. Here we have a very seasonable industry, highly speculative construction which in many cases shakes buyers' confidence, and an unwavering attitude on the part of workers for a high standard of wages even though consistent work is impossible under such conditions. This applies largely to plasterers, bricklayers, carpenters and laborers but it also applies largely to plumbers as well.

In this connection C. Howard Smith, President Canadian Manufacturers' Association, made an interesting comparison in an address recently delivered. He compares wages of these workers as follows:

	United Kingdom per week	Canada per week
Plumbers	\$18.50	\$55.00
Plasterers	18.15	55.00
Bricklayers	18.00	44.00
Carpenters	18.00	39.00
Laborers	13.25	20.00

A big spread is at once apparent between these scales of wages. In many cases these classes of workers are more seasonably employed in Canada than in England and feel they need the money. But it is just a question if this idea is not much overdone. It is not necessary for winter to prove such an obstacle to building as has been the case in the past and it would certainly help improve conditions generally for this trade to be put on an all year basis at a fair rate of remuneration. Building activity will not return to normal until wages of tradesmen are in keeping with agri-

cultural and industrial rates. This can be accomplished without any hardship to anyone by a concerted effort to make building an all year business.

Raising the Status

THERE has been a great deal of misuse of the word "engineer" recently, this term being applied to various groups which have very little connection with anything that represents engineering. Opposition to this was taken editorially in a recent issue of a trade publication dealing with the building industries, and Sanitary Engineer joins in condemnation of loose practice in the use of this term. Probably such practice has developed because of the fact that the term does not convey its true meaning as plainly as does the term "lawyer," "doctor," or "dentist." It means just as much to the engineering profession, however, as do those terms to their respective professions and it is up to those who bear this identification to see that the public is made well aware of what it means.

An indication of how far afield the term "engineer" has rambled is found in the fact that at the recent Canadian National Exhibition, a sign suspended advised passersby that the exhibitor in this instance was a "golf engineer." His duty was the laying out of golf courses. While this may call for some ingenuity and skill it is questionable whether it can be classed as engineering. There are also such terms as packing engineer, caterpillar engineer, vocational engineer.

The term "engineer" as applied to skilled sanitarians and heating operators, lends a certain dignity which is becoming to those who have put in their apprenticeship and who represent such an important profession. Unfortunately many such operators are not sufficiently aware of their own importance in modern civilization. As preventors of disease the sanitary and heating engineers are just as important in their profession as the doctor who is called to alleviate illness. It is up to every man in the industry to do his part to impress the public that his profession is one to be honored, then will he raise the status of his calling.

More Information Desirable

HOW much of the details of the business operations of a corporation should be disclosed in its annual report to shareholders? So long as dividends are maintained, few shareholders pay much attention to the company's statement, provided the published figures indicate that the dividend has been earned.

When the shares of a corporation listed on the stock exchange do not act in accordance with the predictions of those who have advised their purchase, the published statements of the corporation are widely discussed and analyzed. The favorite method seems to be to stress the value of the assets over liabilities, and to compare the book value of the shares with the market price. Strange to say, in these cases the market price of the shares is seldom affected favorably by these published analyses. They do not touch the real cause of the fall in price, which is usually due to smaller net earnings of the corporation. Few company statements give more than a skeleton trading and profit and loss account, and without a trading account showing purchases, sales and expenses, no adequate analysis is possible.

These analyses too would be more accurate if, instead of stressing the assets, the liabilities were dealt with, as these in reality are far more reliable indications of the worth of the company than the assets; they do not shrink in the process of realization. It is not what a man owns, but what he does with it, that decides his business standing, and this also holds true in the case of a corporation.

Why Some Plumbers Lose Money

AN OLD merchant once said that most failures were due to the use of hope rather than arithmetic in bookkeeping.

"Men first deceive themselves," he said, "and then they deceive others."

How true this is!

None of us likes to admit the truth, if it is to his detriment. We postpone unpleasant undertakings, and we try to make black white because it pleases us to do so.

I once knew a printer who was long on hope, but short on bookkeeping.

He had saved \$15,000 out of his earnings and profits in a partnership.

With this money, and some more which he borrowed from friends, he established a thoroughly modern plant.

He knew all about printing, but he knew nothing about bookkeeping. He went out and he sold work cheap. His bookkeeping, which he did mostly himself, showed a good profit. At the end of the first year he thought he had made so much that he bought an automobile for his family. The next year he made other large personal expenditures out of "profits." At the end of five years his creditors asked permission to have his books audited.

This audit was a difficult task, but when completed it showed a \$7,500 depreciation in the value of the plant, none of which had been charged off, while current liabilities exceeded current assets by \$10,000. Although this printer had started with a clean slate, he had gradually fallen behind in his accounts payable until he owed three times as much as he had due him on accounts receivable.

In other words, his net assets were \$17,500 less than when he began business.

He had confused gross profits with net profits; and he had failed to set aside a sum sufficient to take care of the wear on his machinery.

This is the kind of bookkeeping which is based on hope instead of arithmetic.

It is the explanation of suicidal price-cutting, for the price-cutter does not know he is headed toward bankruptcy.

Even in the handling of our personal affairs we would all be better off if we put less emphasis on hope and more on arithmetic.

We all know that some day we are going to grow old and reduce our earning capacity. We all know that seven-tenths of all persons over 65 years are dependent on others.

How much better off we would be if we would squarely face the situation, analyze the facts like a real bookkeeper and be ready to meet all contingencies.

When You're "Inside"--Stay There

Minute Message No. 33

Written for Sanitary Engineer by FRANK STOCKDALE

Sales Series

A SALE is like a revolving door. You're either on the inside or outside.

This is a tip to those who have a tendency to talk too much in making sales.

The main thing, of course, is to know when you are "inside"—that is, when you have reached the point where the customer is ready to buy.

This is done only through practice and observation. Watch carefully the actions, attitude and expressions of your customer.

There is no rule for closing the sale, because every customer is a rule to himself.

Selling is about one part talk, three parts demonstration of the goods and six parts judgment of what to say, when to say it and when to stop.

THINK IT OVER—APPLY IT TO YOUR BUSINESS

News Notes From Coast to Coast

Doings in the Plumbing and Heating Industry

NEW FIRMS

Stratford, Ont.—P. Griffin, and H. Riggs, have opened a small brass foundry in this city, turning out plumbers' supplies and a number of novelty lines.

Winnipeg. — A. E. Green, late of the firm of Green & Litster, Ltd., has opened a plumbing and heating contracting business, with showrooms and offices at 237 Fort St.

BUSINESS CHANGES

Burks Falls, Ont.—Wm. Young has disposed of his plumbing and tinsmithing business to the Burks Falls Hardware Co.

INCORPORATION

Pneu Oil Burners, Toronto, has been incorporated for \$40,000 to manufacture hot air, steam, gas and oil furnaces, stoves and heating appliances, by John R. Rumball, Lawrence A. Landriau and Enoch G. P. Dean.

FIRE LOSS

Arnprior, Ont.—Adam Andrews, plumber and tinsmith, suffered a loss recently in a fire which did serious damage to a number of business properties.

Sault Ste. Marie, Ont.—Flockhart Bros., tinsmiths, 421 Queen St. East, suffered fire loss to the extent of \$250, covered by insurance, recently, when fire broke out on the second floor of the building. The cause is unknown.

PLUMBER INJURED IN FALL

Owen Sound, Ont.—W. A. Owen, a former local plumber, now in business in Jarvis, Ont., met with a serious and painful accident while working on a roof in that town. He slipped and fell twenty feet to the ground, the fall resulting in the breaking of both arms and one hip.

PLAN SANITARY CONVENIENCES FOR PARK

Toronto. — Plans for installing a system of water fountains and lavatories in High Park will be submitted to the city council next year by Parks Commissioner Chambers. This will be a large undertaking, but it is Commissioner Chambers' idea that the work be undertaken by sections, commencing the work next year.

CALLING FOR TENDERS

Tenders are being called for by the Public Works Department for heating, plumbing and electric wiring of the public and separate schools at Haileybury, Ont., Oct. 22 being named as the closing date.

LEAVES LARGE ESTATE

Toronto. — An estate valued at \$281,805 was left by the late John E. Laxton, former superintendent of the Consumers' Gas Co., and Harbor Commissioner. The estate included 916 shares in the gas company, valued at \$145,415.

TO CONSTRUCT JOINT SEWAGE SYSTEM

Bridgeburg, Ont.—It is proposed to co-operate with Fort Erie on the construction of a joint sewage system on Gilmore St., the dividing point between the two towns. Bridgeburg must also take immediate steps to improve its water system, the water now in use having been declared unsafe for drinking purposes.

TORONTO ENGINEER ON EXECUTIVE

Toronto. — R. O. Wynne-Roberts, consulting engineer, has been nominated by the nominating committee as one of the members of the executive committee of the Sanitary Engineering Division of the American Society of Civil Engineers for the year 1924.

TINSMITH'S INFORMER ARRESTED

Toronto. — Recently a local tinsmith was fined \$200 and costs for manufacturing a still. Now it has become known that E. Oliver, the Inland Revenue Department employee, who made the charge against him, had submitted the plan for the still and ordered it. As a consequence, a charge of having a still or apparatus, suitable for the manufacture of spirits, without a license, has been laid against Oliver, the charge being laid under a section of the Criminal Code, which says that any man who incites another to crime is guilty of the same crime.

FIX PERMANENT RATE FOR GAS

Toronto. — The fixing of a permanent rate for natural gas in Western Ontario municipalities is now a matter of the not far distant future, following investigations which are being made by the Natural Gas Reference Board of the Department of Mines. In past years, the cost of production has been the main consideration in fixing prices; now, however, the longevity of the field must be taken into consideration and a rate fixed which will mitigate against waste. Natural gas in Western Ontario is no longer

available for manufacturing purposes, and it is even passing rapidly as a means of heating. The time when it will be exhausted for practical purposes is said to be distinctly on the horizon.

RECEIVE MANY IMMIGRANTS

Ottawa. — From returns to date, it now seems certain that by the end of 1923 Canada will have received about 125,000 immigrants.

OBITUARY

Napanee, Ont.—R. C. Wright, aged 75, who died here recently, was for years a traveling salesman for the Gurney Foundry Co., and was formerly a member of the hardware firm here of Boyle & Wright.

Montreal. — Roy Ashton Hamaker, manager of the Montreal branch of the Canadian Johns-Manville Co., and formerly of Rochester, N. Y., was drowned in Lake St. Louis when he was swept from his yawl into the water during a storm. He is survived by his widow and two young sons.

CATALOGS FOR JAPAN

Ottawa. — In the recent disaster in Japan the office and records of the Canadian Trade Commissioner at Yokohama were completely destroyed. A. E. Bryan has cabled urgently requesting all Canadian firms interested in trade with Japan to forward catalogs, price lists, etc., immediately. His address for the present, it should be noted, is 504 Osaka Shosen Building, Kobe, Japan.

HEATING BUSINESS IS BRISK

(Continued from page 17)

Just as attractive advertising will do much toward the development of a greater fall business in heating equipment; similarly a well-designed window trim featuring this line of goods will have its effect upon trade and will draw into the store many prospects who otherwise might have made their purchases elsewhere.

Place one stove, a line on which you desire and are prepared to specialize, in the centre of your window and build up the rest of the trim around it, taking care that in the remainder of the trim you do not overshadow the main object. The stove may be placed in the window and several allied things suitably placed around it, as stove shovel, coal scuttle, lid lifter and a cooking utensil, with or without a ribbon leading from each accessory thing to its particular place of use on the stove. This also well illustrates the psychological principle that submitting objects to successive instead of simultaneous inspection produces the maximum of nervous difference.

Contracts Awarded

Brantford, Ont.—The roofing and sheet metal contract for the new high school has been awarded to Pursley & King, 639 St. Clarens Ave., Toronto, and that for the heating and plumbing to Fred Langdon, Whitby, Ont.

Birtle, Man.—J. W. Ramez, Portage la Prairie, has been awarded the plumbing contract for the \$10,000 hospital being built here.

Freeport, Ont.—The contract for plumbing in connection with alterations and addition to the waterworks system at the Freeport Sanitarium has been awarded to P. Atkinson, Preston.

Glace Bay, N. S.—The plumbing and heating contracts on the \$15,000 hall and shops being built for the Loyal Orange Lodge have been awarded to Stanley Richard, Fletcher St.

Hamilton. — P. Smith, Kensington Ave., has the heating contract in connection with church being built for the King St. Baptist Church.

Kapuskasing, Ont.—The plumbing and heating contract on community hall being built for the Spruce Falls Co. has been awarded to McAlindon & McCormick, Cochrane, Ont.

London, Ont.—R. Milne, 348 Talbot St., has been awarded the plumbing contract for a central heating plant to heat business block and adjoining buildings. E. Leonard, York St., has the boiler contract.

Montreal. — Douglas Bros. Company, 10 Benoit St., have the roofing contract in connection with \$200,000 church being built on Sherbrooke St., W.

New Liskeard, Ont.—The Haileybury Plumbing & Heating Co. have been awarded the plumbing contract for school for the R. C. Separate Board.

Niagara Falls, Ont. — Flynn Bros., Centre St., have the heating contract in connection with the \$11,000 addition to Nurses' Home for Niagara Falls Hospital Trust.

Ottawa. — Band & Cole have been awarded plumbing and heating contracts on the \$70,000 church being built for St. Paul's Methodist Church.

Victoria, B. C.—Heating and plumbing contracts on \$150,000 terminal building being erected for the C. P. R. have been awarded to W. R. Menzie & Co.

Kapuskasing, Ont.—McAlindon & McCormick, Cochrane, have been awarded the plumbing and heating contracts on the new Imperial Bank building.

Montreal. — E. R. Tucker, 120 Congregation, has the contract for the heating in connection with the \$25,000 molasses distillery being built for the Commercial Alcohol Co.

Ottawa. — Roofing, sheet metal, waterproofing, plumbing, heating and ventilating contracts on the \$300,000 building being erected for the Bank of Nova Scotia.

Smith's Falls, Ont.—John Fader has been awarded the plumbing contract, and Harry Hagen, the heating contract on the \$45,000 business block being built on Russell St.

Toronto. — Duffort Bros., 862 Kingston Road, have been awarded the heating and plumbing contracts for \$15,000 public garage and showroom on Danforth Ave.

Brantford, Ont.—R. S. Hope, 217 Terrace Hill, has the heating contract for \$8,000 residence at 186 Dufferin St.

Sudden Death of Alexander Wheeler

With the sudden death in Toronto of Alexander E. Wheeler a few days ago, the Canadian metal trade lost one of its older and best-known figures. The late Mr. Wheeler was born in Toronto in 1849, commencing in business with Thos. R. Bain over 53 years ago, the two being the founders of the firm of Wheeler and Bain, manufacturers of corrugated iron, eavestrough, conductor pipe and jobbers in sheet metal.

Predeceased some twenty years by his partner, Mr. Wheeler continued an

Late Alexander Wheeler

active member of the firm right up to the time of his death, which occurred very suddenly on October 5.

The late Mr. Wheeler took an active interest in politics, having been a federal candidate once, opposing Judge Coatsworth. He was, at one time, president of the Reform Association.

The survivors include his widow, three daughters and two sons, the latter, George and Norman, being vice-president and secretary-treasurer respectively of the firm of Wheeler and Bain.

Hamilton. — Wm. Newell, James and Augusta Sts., has the plumbing contract, and Chas. Havers, Wentworth St., the heating contract on several residences being erected on Tragina Ave.

Kitchener, Ont.—D. Becker, New Hamburg, has been awarded the heating and plumbing contracts for four residences being built at Baden.

London, Ont.—Allen & Pope have the plumbing contract for L. Bradshaw's new residence on Dufferin Ave.

Montreal. — Jos. Paicment, 3488 St. Hubert, has the contract for the heating and plumbing in connection with two residences on St. Gerard.

Moncton, N. B.—The Moncton Plumbing & Supply Co. has been awarded the plumbing contract for an \$8,000 residence being built on Lime St.

Ottawa. — William Bros., Ottawa, E., have the plumbing contract, and the Pease Foundry Co., the heating contract for a double residence being built on Russell Ave.

Port Credit, Ont.—J. H. Doughty, Mimico, has the heating and plumbing contract on a residence being built on Mississauga Rd.

Port Credit, Ont.—J. Derry, New Toronto, has the plumbing and heating contract on a residence being built on Mineola Rd.

Stratford, Ont.—Cook & O'Donoghue, 111 Downie St., have the heating contract on 20 residences being erected by Wm. Newman, 55 Cherry St.

Toronto. — L. J. Harris, Coxwell and Poulton Aves., has the plumbing and heating contract on a \$7,500 residence being erected on Coxwell Ave.

Toronto. — Daniel Glynn, 992 Dundas St., has the heating and plumbing contract for a \$12,000 duplex residence at 566 Durie St.

Toronto. — W. S. Honeycombe, 124 Yarmouth Road, has the contract for plumbing in connection with \$25,000 residence being built on Forest Hill Rd. for H. H. Horsfall, Leaside.

WELSH TINPLATE CAPACITY GROWS

London, Eng.—One industry that is not feeling the effects of the industrial slump is the manufacture of Welsh tinplate. The tinplate factories are not only working at full capacity, but ten new mills are being erected at Llanelli and Pontardawe as speedily as possible to take care of the orders which are pouring in.

TIN PLATE MERGER ANNOUNCED

London, Eng.—An amalgamation has been arranged between the Gravesend Steel and Tin Plate Co. and the Richard Thomas Co., largest tin plate makers in the world. The combined weekly output will be approximately 1,200 tons of steel and 7,000 tons of tin plates.

Pictorial Records of Two Recent Outings in Sarnia

LEFT—Annual picnic of Sarnia Plumbers:

Left to right (standing)—Bert Bates, J. Foreman, W. J. Barric, W. H. Pinkett, James Sweet, J. B. Cain, of Detroit, Mich., and Clark Turner.

Left to right (sitting)—P. H. Hays of the Taylor-Forbes Co., D. Brown, Harry Hall, and George Thompson of the Chambers Electric Co.

Front row (left to right)—Fred Cook, Robert Kilpatrick, Alex. Joss, Robert Collum, A. R. Calcutt and E. H. Archer of the H. Mueller Mfg. Co., Ltd.

RIGHT—At recent salesmen's convention of H. Mueller Mfg. Co.:

Top row (left to right)—O. B. Mueller, L. H. Burlleigh, M. A. Schroder, E. Newsome, Wm. Twaits, L. O'Neill, B. F. Mueller.

Second row—R. W. Savage, J. R. Jackson.

Bottom row—J. Wright, J. J. Conway, A. B. Baily, O. G. McMann.

Tenders Wanted

Montreal, P. Q.—Tenders are being received by executive committee for electric, plumbing, heating, and ventilating, in connection with new city hall. No closing date set. Architect, Louis Parent, City Hall.

Ottawa, Ont.—Tenders are being received by the general contractor, Ed. Monette, King Edward St., no closing date set, on roofing, sheet metal, electric, plastering, and painting, in connection with \$40,000 fire station.

Asbestos, P. Q.—Poudrier & Boulet, general contractors, Black Lake, P. Q., are receiving tenders on roofing and sheet metal work in connection with \$250,000 church here.

North Bay, Ont.—Heating, plumbing and ventilating contracts are to be let in connection with \$26,000 parish hall being built for the Anglican church. E. Finnegan is the general contractor.

Sault Ste. Marie, Ont.—Contracts for heating and plumbing in connection with \$9,000 mission being built for the Presbyterian Church will be let by McIntyre & Kelly Bros., general contractors.

Tranquille, B. C.—Plumbing and heating contracts are still to be let on farm buildings being erected here, with H. J. Davies, Kamloops, as general contractor.

Cochrane, Ont.—Contracts for heating and plumbing on \$5,000 addition to hotel, James Palangio, owner and builder, are still to be let.

Toronto, Ont.—H. B. Kennedy Construction Co. are general contractors on \$20,000 garage going up at 360 Spadina Ave. Electric, heating and plumbing still to be let.

Toronto, Ont.—H. B. Kennedy Construction Co., general contractor, has the awarding of plumbing, roofing and heating contracts in connection with \$100,000 manufacturing building for the Empire Clothing Mfg. Co., Spadina Ave. and Phoebe St.

A BIG OPPORTUNITY

(Continued from page 19)

tile pipe has been laid as shown in Fig. 3.

In an ordinary house sewage disposal system the usual practice is to allow two lineal feet of field tile pipe 4 inches in diameter to each gallon of sewage to be flushed at each operation. But, on account of the close proximity of the creek, it was decided to furnish a larger number of field tile pipes than usual, so that, instead of only laying about 5,000 lineal feet, 5,600 feet were allowed, not counting the 9-inch main distributing pipe.

It might be asked, why allow such a large number? The reason is that, when a syphon operates, it flushes a large quantity of sewage, and, as the dosing chamber must empty each time the syphon works, the sewage must have somewhere to go, one lineal foot of 4-inch field tile holding about $\frac{1}{2}$ gallon of sewage.

Up to the present there has been nothing said as to what takes place in the ground. There is, however, another

kind of bacteria in the ground which begins to do its part, because the syphon tank is not all in a disposal system. The ground close to the surface is teeming with millions upon millions of what are known as aerobic bacteria, and these germs are the ones which finally take all the harm out of sewage, provided that they get a chance to co-operate with the air and the sun and maintain such a warmth that the fluid never freezes, not even in the most severe climate.

It has been found that some few persons have been somewhat skeptical about such a statement and, despite advice given to the contrary, have put the field tile pipe down several feet below the surface. There being fewer aerobic germs there, the sewage has frozen solid. So, while sewage discharged into pipes several feet below the surface will freeze, such effluent will not freeze if the pipes are from 14 to 24 inches below the surface.

Fig. 3 shows the complete area of the ground in which the disposal tile septic tank is laid, and, as stated before, the installation is working splendidly. Thus it will be seen that the question of disposing of sewage need not be a barrier to locating an industrial plant in a country town or rural district.

HEATING CONTRACT AWARDED

Brampton, Ont.—The contract for the installation of the heating plant in the Peel Memorial Hospital has been awarded to R. T. Harmsworth at a cost of \$4,000. The hospital will be opened on Armistice Day.

SKYLIGHTS OVER GARAGES AND POWER PLANTS

(Continued from page 20)

that neither the elevation nor the plan represents true length, as the elevation gives us the altitude, while the plan gives us the base. So we take a paper strip and set it as at "A" and from each point in the bar U, also the lower curb, we project horizontal lines to this paper strip. Next transfer this strip to all its points at right angles to a-A of plan. From each point in this paper strip "B," square out lines parallel with a-A as plan indefinitely. Now from each point in the miters of ridge and curb, square out lines at right angles until they intersect those from paper strip, as in points a-b-c-d and A-B-C, etc. Join these points with lines and you have the true diagonal elevation of hip.

To get the true profile of hip bar, that is, the angles at which to bend the glass shoulders, also to get the true girth, reproduce the detail "A" with all its points to the position "G," erect lines into section through hip and at these intersections you can trace the outlines for detail "E." Pick this girth from "E" and set it off on a line as 1-6 and

then develop the pattern from the miter lines as shown. As both halves of this hip pattern are alike, only a half pattern is here developed, but in the shop a full pattern should be laid out.

To develop the jack bar, draw any line square from curb, as at "C." Reproduce the detail "B" with all its points, as at "C." From these points draw lines to intersect the hip bar in plan, which will give this miter line as shown. From here lines are erected into elevation until they intersect corresponding lines and that will enable you to trace those having miter lines for jack bar as shown. The only way to get these is to check them up and follow them from point to point. In setting out the pattern the girth can be taken from either detail "A" or "C" and is set off at right angles to the section through common bar B-b. Then draw stretchout lines and from each point in the miter line for jack bar, square out lines to intersect similar lines in stretchout. Through these intersections, draw lines and you have the pattern for jack bar. The common bar can be laid out in the same way. Laps must be allowed for joining the various bars together when assembling the work.

THE ONLY WAY

A man tells of a plumber who started poor twenty years ago and has retired with a comfortable fortune of \$50,000. This money was acquired through industry, economy, conscientious efforts to give full value, indomitable perseverance, and the death of an uncle who left the plumber \$49,999.50.

REAL FRIENDS

Brown, a newly-wedded suburbanite, had promised to be home from town at six o'clock. At midnight his wife frantically sent six telegrams to as many friends living in town asking each if her husband was stopping with them overnight. Toward morning hubby and his broken down auto were approaching the house when a messenger boy rushed up with six telegrams. All of them read: "Yes, John is spending the night with me."

First College Student (over the phone)—"What are you doing?"

Second Student—"I just finished washing my B.V.D.'s."

Central (breaking in)—"I'm ringing them!"

Youthful Curate: "Will all those who have missionary boxes kindly send them in as soon as possible, as the Vicar wants to go for a holiday?"

THREE GOOD REASONS

Village Doctor (to the elder who is paying a call): "But surely, Saunders, you will have a drop of something before you go?"

Saunders: "No, thank ye, doctor, I've three gude reasons for refusing your hospitality. First, I'm the chairman of the local temperance society; second, I'm just gaen' tae a kirk meeting; and third, I've just had one."

HER INTUITION

He, savagely (attempting to start car)—"This self-starter won't work! There is a short circuit somewhere."

She (sweetly)—"Well, why don't you lengthen it, dear?"—S. E.

New Goods of Interest to Plumbers

T. G. Griffith & Company have added a new line in the form of the Robb Coal Carburetor. This device, it is claimed by the manufacturer, saves coal, inasmuch as more heat is obtained from a ton

of coal by the proper mixture of oxygen, introduced over the fuel bed.

This carburetor is a casting, and is bolted to each fuel door of the furnace, and which projects into and above the fuel bed. The carburetor is constructed with ribs on the outside to absorb the heat of the fire, and at the same time strengthen the casting to withstand the heat. On the inside are a series of baffles and ridges, which also go to strengthen the carburetor casting and

divide the air that is drawn through into a number of small streams which become highly heated and spread fan-like among the combustible gases, producing perfect combustion, consuming the gases and preventing a large part of the smoke, which would otherwise pass off unconsumed.

It is claimed that a number of tests have been made on steam boilers with and without carburetors which have proved that from ten to twenty per cent. less coal is consumed to evaporate the same amount of water when carburetors are used than without.

STELCO FELT ROOFING NAILS

The Steel Company of Canada, of Hamilton, have placed on the market, recently, a high-grade roofing nail, described as the "1 Stelco Felt Roofing Nail." The head of this nail is of a checkered pattern, as shown in the accompanying sketch, and is 9-16 in. in diameter.

The special features claimed for the Stelco felt roofing nail are: The sharp point, the round shank, semi-barbed full length, and well-centred head—this last being a particular advantage with a nail having such a wide surface.

In addition to the use of these nails in connection with the laying of all kinds of felt and other roofing, they are also largely used with wire lath.

Catalogs and Booklets

Those interested in any of the catalogs described below can procure a copy of the same by writing direct to these firms. Mention that you noticed this in Sanitary Engineer.

IMPERIAL RADIATOR HANDBOOK

The Imperial Radiator Co. of St. Catharines, Ont., have recently issued a new handbook in which they have presented in a very complete manner, their line of boilers and radiators, and also their other lines of fittings and specialties, etc. This volume is small enough to be carried around in the pocket and it contains 170 pages of reading matter and illustrations. It is well bound and the paper contained in this book is of fine quality. As well as describing the goods manufactured by the Imperial Radiator Co., it contains much useful information for the plumber, sanitary engineer, and steamfitter, such as lists and description of symbols used in reading blue prints, also many tables of weights, measures and pressures.

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

WITH the fine, exportable wheat crop that was harvested this Fall being at present marketed, improvement in business conditions should soon be noticed. Cattle exporting conditions being settled satisfactorily and a noticeable increase in demand for Canadian pulp and lumber should also have a favorable effect on the coming year's pros-

perity. Seasonable lines are moving well in all centres, especially stoves, heaters, ranges, furnaces, boilers, and other heating equipment. Trade in these lines is going ahead in full swing and dealers in heating lines report very favorably on business which has been done this Fall and which is in progress at the present time.

Montreal Markets

MONTREAL, October 13.—Dealers and jobbers in the local market report that a noticeable improvement in trade has been felt during the past two weeks. Canada plates are firmer in price, due to a noticeable scarcity in some lines. Lower prices are now in effect on Dominion wipers. Prices on range boilers are now more settled and quotations are the same as issued two weeks ago.

The metal market continues rather easy in tone with copper being exceptionally weak. The general falling off in business in the U.S.A. seems to have forecast a further lowering of prices at least temporarily.

Collections are reported as showing a slight improvement.

LOWER PRICES IN EFFECT ON DOMINION WIPERS

Montreal.

Prices on Dominion wipers show a decline of one cent per pound, and the following prices are now in effect locally:

COTTON WASTES—	Per lb.
Cream polishing	0 24
White, XXX extra	0 20
White, XX grand	0 18½
White, XLGR	0 17
X Empire	0 15½
X Press	0 14
Colored—

Lion	0 14
Standard	0 12½
Popular	0 10½
Keen	0 08½
Wool Packing—	
Arrow	0 25
Axle	0 21
Anvil	0 17
Dominion Wipers—	
White cotton	0 18
Colored cotton	0 14

SALES IN CORRUGATED SHEETS QUITE SEASONAL

Montreal.

Dealers in corrugated sheets state that sales in this line are quite seasonal. Prices are steady and are quoted locally as follows:

CORRUGATED SHEETS—	Per 100 sq. ft.
No. 28 gauge	7 00
No. 26 gauge	7 50
No. 24 gauge	10 00
No. 22 gauge	12 50
No. 20 gauge	14 00
No. 18 gauge	19 00
Less 10 per cent.	
Lighter than 24 gauge and wider than 27 ins.,	
75 cents per square extra	

TRADING IN CLOSET GOODS FAIRLY ACTIVE

Montreal.

Dealers report that trading in closet goods is fairly active at the present time. Prices remain steady and are in effect locally as follows:

CLOSET COMBINATIONS—

GOOD SALES IN METAL LATH; PRICES STEADY

Montreal.

Sales on metal lath are reported as being quite good and dealers are quite optimistic as regards fall business. Prices remain steady and are being quoted as follows:

METAL LATH—	per sq. yd.
Painted—	
26 gauge	23c.
24 gauge	25c.
32 gauge	32c.
Galvanized, 5c. per sq. yd. extra.	

CANADA PLATES SCARCE; PRICES ARE FIRMER

Montreal.

Prices are very firm on Canada plates owing to a scarcity of some of the better selling lines.

Prices in effect are quoted herewith:

BLACK SHEETS—

10 gauge, base	4 75	5 00
12 gauge	4 85	5 00
14 gauge	4 95	5 10
16 gauge	5 05	5 15
18-20 gauge	5 20	5 25
22-24 gauge	5 20	5 25
26 gauge	5 25	5 40
28 gauge	5 35	5 50

GALVANIZED SHEETS—

	Queen's Head	Fleur de Lis
18-20 gauge	6 90 7 40	6 65 7 15

Do., 4½" and larger	5%

Malleable Fittings—

Price list effective June 1st, 1922. Discount 63 per cent.

BRISK TRADE NOTED IN RADIATORS AND BOILERS

Montreal.

Dealers in radiators and boilers report that a good steady business in this line has been maintained for some time and that prospects for a good volume being done this fall are very bright. Prices show no change and are in effect locally as follows:

RADIATORS AND BOILERS—

Radiator list prices are for 1, 2, 3, 4 and 5 column radiators, per sq. ft.
45 in. to 38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60. Discount 44 per cent for hot water, and 45 per cent. for steam.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05; Discount 41 per cent.

Boilers—Round water boilers, sizes from 0 to 10, 52 per cent. off list. Square or sectional hot water or steam boilers, 15 in., 3 per cent. with Ontario Government trimmings, list. Square or sectional water boilers, 19 in. to 36 in., 8 per cent. Square or sectional steam boilers, 19 in. to 26 in., 8 per cent. Ontario Government trimmings, list plus 7 per cent. Square or sectional water or steam boilers, 48 in., list plus 10 per cent. With Ontario Government trimmings, list plus 18 per cent.

Round steam boilers, standard trimmings, 16 per cent. Ontario Government trimmings, 13 per cent.

F.o.b. Montreal. Toronto. Guelph.

SCRAP MARKET QUIET WITH PRICES STEADY

Montreal.

Dealers in scrap materials report that prices are steady and that trading is noticeably slow. Indications are that

an advance in price in practically all lines will take place in the very near future. Prices existing at the present time are as follows:

SCRAP

Automobile Tires	0 50
Rubber Shoes	0 02
Yellow brass	0 06½
Red brass	0 08½
Light brass	0 04½
Scrap zinc	0 05
Lead, heavy	0 05
Lead, tea	0 03
Light copper	0 09½
Heavy copper	0 11½
Wrought iron, lt. Rd. No. 1 per gr. ton ..	14 00
Malleable scrap (ton)	16 00
Pipe scrap (ton)	8 50
Heavy melting steel	9 50
No. 2 bushing	5 50
Boiler plate	12 00
No. 1 machinery cast	20 00

PRICES ON RANGE BOILERS NOW MORE SETTLED

Montreal.

Prices on range boilers are now more settled with discounts the same as issued two weeks ago. List and discounts prevailing locally are as follows:

RANGE BOILERS—

5 Gallon	\$13 50
12 "	14 00
18 "	15 00
25 "	16 50
30 "	special 9 50 net
35 "	20 50

192 "	210 00

Discount Standard, 45 per cent.; Extra heavy, 40 per cent.

SOIL PIPE PRICES FIRM AT FORMER LEVELS

Montreal.

Dealers report a good volume of business in soil pipe during the past two weeks and prospects are good for fall trading. Discounts remain unchanged and are in effect locally as follows:

SOIL PIPE—

2 and 3 inch	20%
4 inch	25%
5 and 6 inch	20%
8 inch	net

FITTINGS—

2 to 6 inch	37½%
8 inch	net

WEAKNESS IN COPPER FEATURE OF INGOT METAL MARKET

Montreal.

The metal market continues rather easy in tone with copper being especially weak. The general falling off in business in the U.S.A. seems to have forecast a further lowering of prices, at least temporarily.

TIN.—The chief feature of this metal has been the premium ruling for October delivery in London, and there is now a wide spread between spot and futures. New York refuses to respond to the advances in London and the market shows a hesitating tone with prospects of a further decline. The local market is easy at 47½ cents per pound.

COPPER.—The decline this week is even more extensive than previously reported and evidently drastic methods are to be employed to reduce production. With electro selling at 12½ cents in New York, many mines are operating at a loss, but it remains to be seen whether

even this figure will induce any particular demand. At the same time, today's price is low and values can hardly go much lower. The local market is weak at 19 cents for electro and 18½ cents for casting.

LEAD.—This metal is the steadiest on the list and with production and consumption fairly well balanced, prices are practically unchanged from last week. The local market is steady at 8½ cents.

ZINC.—Although the prospects for this metal are fairly good, there is a sagging tendency to the market both in

London and East St. Louis. There is no profit to the smelters at present levels and any increase would see a sharp recovery in price. The crux of the situation lies in the U.S.A. as there is a certain amount of export business going, but local demand is dull. The local market is quiet at 9 cents per pound.

ANTIMONY.—This metal is very dull and there seems to be little demand at the present time. The local market is dull and prices are unchanged at 8½ cents for English and 8 cents for Chinese.

Toronto Markets

TORONTO, October 13.—Local dealers and jobbing houses report that business has been very active in all seasonable lines during the past two weeks, heating equipment sales being particularly good.

Globe, angle and check valves have advanced about five per cent., and gauge glass washers are also higher in price.

Declines have occurred in melting pots, and some lines of iron and steel.

Stronger tones are noticeable in connection with the prices on Canada plates, cotton waste, and galvanized sheets, and easier tones in regard to black and blue sheets, pig iron and ingot copper. The scrap market has been very slow with prices at low levels.

Collections are slightly improved in most centres of Ontario.

NEW PRICES ISSUED ON VALVES 5 PER CENT. HIGHER

Toronto.

New prices are issued on Standard Globe, Angle and Check valves. The former discount of 23 per cent. is now replaced by 20 per cent., and the old discount of 28 per cent. on Jenkins pattern disc valves is replaced by 25 per cent.

Discounts on other lines are as given herewith:

VALVES AND COCKS—		
Compression work—Standard	48%	
Fuller work—Standard	30%	
Basin Cocks, Fuller, No. 0	30%	
Nos. 1 and 2	30%	
Bath cocks—compression	40%

DECLINE NOTED IN PRICES OF MELTING POTS

Toronto.

Melting pots have declined in price in some makes. The new prices being quoted are as follows:

5 inch, 50c. each; 6 inch, 75c. each; 8 inch, \$1.40 each.

TARRED FELT NOW SELLING AT \$3.40 PER CWT.

Toronto.

Tarred felt prices are about five cents lower at present with some dealers than was formerly the case. The price

of \$3.45 per cwt., which has been in effect, has been replaced by the new price of \$3.40 per cwt.

Dry carpet felt and asphalt felt prices have not been changed for some time.

Prices are considered to be at a low level, as the general undertone in the raw materials market is fairly strong and some manufacturers claim, on account of the increasing prices of rags and other raw materials used in the manufacture of ready roofings and felts, that an increase in price is justified on these lines, but on account of conditions prevailing at the present time, no changes have yet been made. Prevailing felt prices are given herewith:

FELTS—	
Carpet Felt, 16 oz.	4 35
Carpet Felt, 20 oz.	4 35
Carpet Felt, 24 oz.	4 35
Asphalt Felt, 10 lbs.	3 45
Asphalt Felt, 15 lbs.	3 45
Asphalt Felt, 25 lbs.	3 45
Tarred Felt, 7, 10, 16 oz.	3 40

CANADA PLATE PRICES FIRMER; SOME SIZES SCARCE

Toronto.

Some sizes of Canada plates are quite scarce at the present time, some dealers being right out of ordinary 52's and ordinary 60's.

Prices have firmed up considerably, most noticeably on the two sizes mentioned above.

Formerly, ordinary 60's were selling at from \$5.70 to \$6.10 per box, and 52's were selling at from \$5.40 to \$6 per box. The lower of these figures is not applicable now, and the prices are on ordinary 60's, \$6 to \$6.10 per box, and on 52's, \$5.90 to \$6 per box.

The range of prices on these and other sizes is given herewith:

CANADA PLATES—		Per box
Ordinary, 75s	5 85
Blued, 75s	6 15
Blued and oiled, 75s	6 25
Polished, 75s	7 05
Ordinary, 60s	6 00
Blued, 60s	6 00
Blued and oiled, 60s	6 10
Polished, 60s	6 90
Ordinary, 52s	5 90
Blued, 52s	5 60
Blued and oiled, 52s	6 00
Polished, 52s	6 80
Welsh polished, 60s	7 35
Welsh polished, 52s	7 25

NEW PRICES ISSUED ON GAUGE GLASS WASHERS

Toronto.

New prices are issued on flat and round gauge glass washers, which are advanced over prices formerly quoted.

The new levels being quoted are given herewith:

GAUGE GLASS WASHERS—		cents per doz.
Flat washers, ½ inch	12
Flat washers, ⅝ inch	14
Flat washers, ¾ inch	16
Round washers, ½ inch	21
Round washers, ⅝ inch	25
Round washers, ¾ inch	25

LOWER PRICES ON SOME LINES OF IRON AND STEEL

Toronto.

Dealers report that local sales of late have been more diversified, and this fact along with the fact that surplus stocks, which have been on the market in many lines since the war and which have been the means of continually upsetting prices on the market, are showing signs of being very nearly exhausted and not nearly as many cases of price cutting are existent. This stabilizing of iron and steel market prices is expected to have a favorable effect on business in these lines and better business is looked for in the near future.

Hoop iron has eased off in price to dealers.

Hoop iron heavier than 1 inch x 20 gauge, which has been selling at \$5.50, is now being sold at \$5 per cwt., and hoop iron 1 inch x 20 gauge and lighter which has been selling at \$6, is now selling at \$5.50 per cwt.

The revised iron and steel list of base prices is given herewith:

IRON AND STEEL—		Per cwt.
Bars, steel	base 3 75	3 90
Bands, 3-16 in. and lighter	4 25	4 50
Hoops hevaier than 1 in. x 20G	5 00	
Hoops, 1 in. x 20 G. and lighter	5 50	
Shapes, structural	4 00	4 25
Shapes, smaller than 1 in.	4 00	
Sheets, Galv., base	6 50	6 65
Sheets, black, base	5 50	5 65
Sheets, blue, base	4 50	4 75
Plates, ¼ in. and heavier	3 90	4 00
Plates, 3-16 in.	4 25	4 40
Cold rolled steel, rounds	5 25	
Sleigh shoe steel	4 10	4 15
Cold rolled flat square, Hex.	5 75	
Tool steel, high grade	30 00	
Drill steel	18 50	
Crucible cast sheet	30 00	35 00

PRICES SLIGHTLY EASIER ON BLACK AND BLUE SHEETS

Toronto.

A slightly easier tone is noted of late on black and blue sheets at basic sources. Prices to dealers are not as yet affected; those formerly published are still being quoted.

Makes Sales— Makes Friends

MUELLER A-2280 Combination Sink Faucet appeals instantly to every woman—unnecessary to urge its strong points—they show at a glance—that's why it sells quickly and easily. Its many convenient uses makes a friend and a prospective future customer.

Mueller Combination Sink Faucet A-2280

(Gives water in any part of sink
—not confined to certain radius)

Lessens dishwashing drudgery—sprays flowers—cleans vegetables—fills pails on the floor—cleans the sink—and saves the woman's hands.

Raising or depressing the center knob gives hot, cold or tempered water through spout or spray.

Rapid construction—cone seat washer—3 feet of good red corrugated hose—a high grade **MUELLER** product at a reasonable selling price netting you a good profit.

Order a sample today. Fully warranted.

H. MUELLER MFG. CO., LIMITED

and Bronze; also Brass Screw Machined Products.

This **MUELLER** Faucet makes it easy to wash the dishes, without making the hands red and rough.

No. A-2280 (Patented)
can be quickly installed on any regulation sink, and will last a lifetime.

Strike Settlement Helps Stove Sales

THE prospects for stove and furnace trade this season show a marked improvement over the last two or three years, and it is the opinion of Sanitary Engineer that a good season's trade may be expected.

No doubt electric cooking during the last few years has affected the sale of regular coal ranges in some of the larger centres, but in other parts it is still too expensive to be used extensively.

There is a very brisk demand for both stove and furnace repairs this season. Possibly the early cool weather has caused the public to think of these things sooner.

One factor that we believe will help stove and furnace business this season is that the question of coal supply has been

settled, and, even though the price is higher, the public know what they are going to get. There is a feeling in some quarters that this will create renewed interest in baseburners for heating on account of the great economy in fuel which they show.

The warm week that has just passed has in a good many cases turned out to be a week of very fine business with manufacturers. This is different from last year, inasmuch as at this time last fall a week of warm weather occurred, and in almost all cases manufacturers reported a sag in orders as being the result. This fact goes a long way toward proving that general conditions are in a much healthier state than they were a year ago.

STRONGER TONE NOTED IN COTTON WASTE PRICES

Toronto. A stronger tone is noted in prices of all lines of cotton waste.

Though the prices to dealers have not been changed as yet locally, no lower prices are looked for. If any movement is made, it is expected to be in an upward direction.

Prices on all lines of cotton waste have been advanced one cent per lb. in U. S. A.

Cotton thread mills are not working full time, and as there is a good amount of business moving now in this line, a slight scarcity has been noticed of late.

Prices in effect now are given herewith:

COTTON WASTES—

FALL RADIATOR AND BOILER BUSINESS VERY BRISK

Toronto. Heating contractors and dealers report that strong sales have continued to be the case ever since the advent of the cooler weather, and that good business in these lines is being done at the present time. Practically every heating firm has had as much business as could be

In U. S., some of the independent mills are cutting prices on some lines to obtain good-sized orders, as bookings are getting scarcer and business may be taken on at lower figures in order to keep mills operating. Prices effective now are given herewith:

TANK STEEL PLATES—	
¾-in. and heavier, base	3 60
3-16 in.	3 95
BLUE ANNEALED SHEETS—	
10 gauge, base	4 50
12 gauge	4 55
14 gauge	4 60

22-24 gauge	5 50
26 gauge	5 55
28 gauge	5 65
A charge of 25c per 100 lbs. is made for less than case lots. An extra 10c. per 100 lbs. is also charged on sheets 26 in. wide.	

PIG IRON BASIC PRICES ARE STILL WEAKER

Toronto. Basic prices of pig iron in U. S. have again taken a decline. Prices existing to-day are \$9 per ton cheaper than the peak price of a few months ago. Prices in effect in local markets have not been lowered.

PIG IRON—(Price per ton)—	
In ordinary quantities	31 30

INGOT COPPER MARKET TONE IS VERY WEAK

Toronto. Very little ingot metal is being purchased these days. Business is decidedly slow in these lines.

Prices remain firm locally and no changes have been made.

Copper ingots in U. S. are very low in price and further weakening is almost a daily occurrence. No buying, however, is being done in this metal of any account and it will be rather interesting to note just how low producers will let the price go.

Business in general in the metal trades seems to have been somewhat slower during the past two weeks and, should this business brighten up, it is believed by many that this would have a steady effect on the lowering price of copper. Prices in effect are given herewith:

INGOT METALS—	
Copper \$18.00 to \$19.00; Tin \$45.00 to \$46.00;	
Lead \$8.00 to \$8.25; Spelter \$9.00; Antimony,	
\$8.25 to \$8.50; Aluminum, \$23.00 to 25.00.	

Here is Heating Business Within Easy Reach

People in your own circle of friends, old time customers of yours, business acquaintances; among these there are many preparing to go through another winter with an antiquated heating system.

A suggestion from you—a few words of explanation about the many wonder-

ful heating features of the "New King" Boiler; its fuel economy and its moderate price, will serve to bring you much profitable business.

Then to make the heating job perfect, instal Imperial Radiators.

Your copy of our catalogue is here; write for it.

BOILER STANDS REMAIN FIRM IN PRICE AT OLD LEVELS

Toronto.

Range boiler stands remain firm in price at levels established some months previous. Sales have been good in this line, as the demand for boilers has been heavy of late. Prices on most of the good selling lines are given herewith:

BOILER STANDS—

Each—5 gal. \$1.50; 12 gal. \$1.50; 18 gal. \$1.50; 25 gal. \$1.50; 30 gal. \$1.50; 35 gal. \$1.75; 40 gal. \$1.90; 52 gal. \$2.10; 66 gal. \$2.25; 82 gal. \$2.50; 100 gal. \$3.80; 120 gal. \$4.00; 144 gal. \$4.00; 168 gal. \$4.00; 192 gal. \$4.00; Adjustable Stands 12 to 14 in., 45c. Stahl boiler stand, 60c.

PRICES ON GALVANIZED SHEETS SLIGHTLY FIRMER

Toronto.

An undertone which denotes a slightly firmer note is evident in connection with galvanized flat steel sheets.

Prices, however, are not changed, and those existing at present are given herewith:

GOOD FALL SALES OF EAVES-TROUGH AND CONDUCTOR PIPE BEING MADE

Toronto.

Regular lines of eavestrough and conductor pipe have been selling very well during the past two weeks. The fall being here, builders are anxious to finish

up the houses that they have been building during the summer, which has created a good demand for these lines, as well as for outlets, elbows, cut-offs, tubes and conductor hooks. Prices which are in force at the present time are as follows:

TROUGH (Eave)—

O. G. Square Bead—	Per 100 ft.	Per 100 ft.
8 inch	\$15 90	15 inch.....\$34 50
10 inch	17 70	18 inch..... 44 00

Outlets, cut offs, tubes and conductor hooks	
List less 50 and 10 per cent.	

STOVE PIPE DAMPERS SELLING IN LARGE QUANTITIES

Toronto.

Dealers report sales of stove pipe dampers to be very good at the present time. Large quantities have been sold during the past two weeks. Current prices are as follows:

DAMPERS (Cast Stove Pipe)—	Doz.
6 in.	1 70
7 in.	2 10

Winnipeg.

WINNIPEG, October 13.—With grain moving and money going into circulation, a stimulating effect on business is being noticed by dealers and jobbing houses. Red sheet packing and cotton candle wicks are quoted at higher levels. Porcelain basins move upward. There has been a revision in discounts on compression bibbs and also on basin and bath cocks. Boiler brushes show a slight reduction. Prices for the most part are holding fairly well.

COTTON CANDLE WICK PRICES MOVE UPWARD

Winnipeg.

The price of cotton candle wick has moved upward, and quotations are 65c. per lb. This rise in price is in conjunction with the recent general rise in cotton products as a result of the poor crops which have been harvested this year in the southern states.

BOILER BRUSHES SHOW A SLIGHT DECLINE

Winnipeg.

A slight decline is recorded on oval wire boiler and furnace brushes. Present quotations are \$6 per dozen.

Sales are reported to be better this season in these lines.

RED SHEET PACKING PRICES ARE ADVANCED

Winnipeg.

Red sheet packing shows an advance in quotations and present prices are quoted at 37c. per lb. Sales have been

fairly good on sheet packings during the past two weeks.

ADVANCE NOTED IN PRICES OF PORCELAIN BASINS

Winnipeg.

A slight advance is recorded on porcelain enameled basins. Twelve-inch basins, round, with patent overflow, are quoted at \$3.50 each. Oval basins with patent overflow 14 x 17 inches in size are quoted at \$5.10 each, and size 15 x 19 are quoted at \$6 each. Sales of bathroom fixtures during the past two weeks have been made in good volume. Part of the good trade experienced in these lines recently is attributed to the fact that a good many houses which were started in the summer are being finished up, and interior fixtures are being installed.

MISCELLANEOUS COCKS AND BIBBS AT LOWER LEVELS

Winnipeg.

Lower discounts are in effect on sill cocks, wash tray bibbs, boiler drain

Stepping Out After It

WINTER is just over the hill. Crisp nights and fresh mornings herald its coming.

In this keen Autumn weather with its foretaste of arctic rigors to come, you, the Sanitary Engineer, can sell more sewage disposal systems than at any other time of year.

In October and early November your efforts to induce suburbanites and farmers to provide themselves with indoor toilet comfort are crowned with greatest success. You have the active co-operation of our old friend Jack Frost himself. Step out and get their business.

Difficulties Experienced in Obtaining Japanese Trade

THOUGH a lot of figuring has been done regarding the inquiries for galvanized sheets, received recently from Japan, concessions in price having been made in these figures by producers in Canada, as well as substantial reductions in profits being figured on, with the end in view of keeping labor employed, it has been found impossible to arrive at a price low enough to compete with English mills for the delivery of galvanized steel sheets for reconstruction and roofing purposes, etc., to Japanese ports.

The cost of chemicals, labor, taxes, and, in fact, all overhead expenses with the exception of electricity are lower in England, making lower primary pro-

duction costs on steel galvanized sheets than production costs of the same materials from Canadian mills. The freight rates from England to Japan are much cheaper than from Ontario mills to the same ports.

Local factories can cope with American mills for Japanese business, but it has been found impossible under existing circumstances to cope with England in these lines.

About the only way in which Canadian mills could entertain Japanese trade in galvanized sheets, profitably, would be in the event of English firms getting filled up with orders and being unable to ship promptly, or if they found it necessary to raise the price of their products above present levels now being quoted.

cocks, compression stop cocks and angle lavatory stops. Revised discounts are as listed below:

MISCELLANEOUS COCKS AND BIBBS—

Sill Cock, N.P.	47% Off

PRICES ON LEAD AND ZINC GOODS UNCHANGED

Winnipeg.

Lead and zinc goods are reported by dealers to be moving in seasonable quantities.

No changes have occurred in prices during the past two weeks on these lines.

WROUGHT PIPE PRICES ARE FIRM AND SALES ARE GOOD

Winnipeg.

Prices on wrought pipe continue firm. Sales are reported as seasonable, with prices showing no change during the last half month.

SOIL PIPE PRICES FIRM AT FORMER LEVELS

Winnipeg.

A fair volume of business is moving in soil pipe and fittings. Prices show no change over those issued in Sanitary Engineer issue of Oct. 1.

CORRUGATED SHEETS SELLING IN SEASONABLE QUANTITIES

Winnipeg.

The trade report a steady demand for corrugated sheets. Quotations continue steady at levels previously established.

OAKUM SELLING IN FAIR QUANTITIES AT \$4.27 A BALE

Winnipeg.

Dealers report sales of oakum as seasonable and quotations are \$4.27 a bale, and in less quantities 10c. per pound.

NEED BETTER WATER SYSTEM

Port Stanley, Ont.—Sir Adam Beck is much interested in the village's water supply, pointing out that the present system of using filtered lake water is totally inadequate and that steps will have to be taken in the near future to insure plenty of good water. Advice on the same subject was secured from experts some three years ago, but the cost of the proposals proved too great for the actual work to be proceeded with at the time.

Mutual Insurance Companies Claim to Have Advantage

ONE of the big advantages claimed for the mutual form of insurance over that of the stock company form is that the policyholder can be guaranteed 100 per cent. protection and 100 per cent. payment of losses, this feature being made possible through the fact that every policyholder in a mutual company is a co-partner in the company, sharing in profits and losses alike.

Thousands of policyholders, chosen from the highest class business men and citizens, insure in the average mutual fire insurance company. Each shares in the profits made in the way of annual dividends. Should the company be so unfortunate, and such cases are exceptionally few, as to suffer a loss ratio in any single year large enough to wipe out the surplus and impair the reserve, each policyholder would be assessed for any part of, or an amount equal to, the premium written in his policy.

Mutual protection is the only form of insurance that can give the 100 per cent. payment of loss guarantee for this reason—the policyholders make up the loss. They do this willingly, as an extra assessment cannot compare with the large amount of money saved through annual dividends. On the other hand, if a stock company's surplus and capital is impaired by excessive losses, only a few stock holders are involved and can require the company to settle losses at so much on the dollar.

Figures covering insurance activities in connection with the largest fires of the past century on this continent show that the mutual companies were able to pay their losses in full in nearly every instance and that even in those rare instances when this was not possible, paid much higher rates than the payments made by most of the stock companies dealing with the same fire. Also, fewer of the mutual companies by far were forced out of business through disastrous fires.

It is also shown that of all the extra assessments levied by mutual companies, and they have been very few, the average of the assessment has been 25 per cent. of the annual premium. It is claimed by the mutual companies that this extra assessment is paid every year by the holders of stock company policies, the difference between the cost of the two forms of insurance making for the same as an extra assessment by the stock company.

ELECTED VICE-PRESIDENT

Toronto. — Word has been received by the Sheet Metal Products of Canada that G. A. Boyle of that firm has been elected vice-president of the Canadian Chamber of Commerce in London, England. Col. A. Lorne Hamilton, of the British Empire Steel Corporation, is president and Hon. F. C. Wade, agent-general for British Columbia, one of the vice-presidents.

Would You SPECIALIZE For 4 Cents a Week?

WHETHER you are a manufacturer, wholesaler, master plumber, journeyman, apprentice, salesman or occupying any other position in relation to the plumbing and heating industry in Canada, you will find that the receipt of YOUR OWN copy of **Sanitary Engineer, Plumber and Steamfitter of Canada**, twice each month, will greatly help you to keep in close touch with what is doing in all branches of the industry.

Qualified technical men and special representatives in every important centre throughout the country keep the pages of each issue interesting and practical. The big problems of the industry are analyzed and the most authoritative data secured for the guidance of those in the industry.

KEEPING IN CLOSE TOUCH WITH ALL DEVELOPMENTS IN THE INDUSTRY; KNOWING WHAT OTHERS ARE DOING AND WHY, IS THE WAY TOWARD PROGRESS.

For \$2 per year, less than 4 cents a week, you can receive YOUR OWN copy of Sanitary Engineer.

Send the coupon on this page and your issue will be started right away.

Polo Grounds

Yankee Stadium

Yankee Stadium Installation

Ruud Hot Water at the World Series

The new Yankee Stadium, baseball's finest plant, is equipped with a battery of six RUUD Instantaneous Automatic Gas Water Heaters.

Over at the Polo Grounds, McGraw's

famous Giants bathe in RUUD Hot Water after each game.

It is altogether fitting that RUUD, the world's leading automatic water heater, should serve these baseball champions.

The Polo Grounds were opened in 1889, the year Edwin Ruud built the first Automatic Water Heater. "Hank" O'Day's pitching helped New York win the world's series from Brooklyn. John M. Ward, the Giants' shortstop, set a record of ten stolen bases during the series.

When Answering Advertisements Mention
SANITARY ENGINEER

You Can Sell More Marvels

Because:

The Marvel has actually more appeals to a customer's thrift, his desire for cheap operation and the comfort-loving side of his nature than any other heater.

The Marvel is different; it is a tank and heater combined; it is compact; it will deliver a gallon of hot water per minute; it won't get out of order—it can be had in any size.

Marvel heaters leave with the dealer a very generous profit.

Sold only by or through plumbers.

PNEUMATIC WATER SUPPLY SYSTEM

Gives country residents all the advantages of a city water system without the excessive cost

The wide-awake dealer will make big profits out of this system among customers who now have difficulty with their water supply. It is so simple to operate and costs practically nothing for upkeep.

The outfit consists of an air-tight steel tank which can be placed in the basement, and a "Myers" famous guaranteed pump (hand or power), suitable for pumping air or water, together with pipes and fittings.

Any plumber or gas fitter can easily install it. Every outfit guaranteed to do the work for which it is designed. For small or large dwellings.

Write us for Water System Catalogue and prices. Now is the time to interest your customers.

Burnham Boilers

A Grave Fact

It has the same 3 times back and forth fire travel, and between section flues as the regular Burnham sectional. It's long on fire travel, short on coal bills.

It's a wise man who digs his own grave in which to bury his troubles.

The Burnham Round Sectional boiler is a grave digger. It digs right in and buries your heating troubles.

It's sectional in construction, and a whale in the work it does.

Sections can slip through the usual door opening.

Send for circular.

THE life of Wooden Tanks depends chiefly on the Quality of the Lumber used in their manufacture. The three grades most frequently required are Fir, White Pine and Cypress.

The Fir used in the manufacture of TORONTO Tanks comes from British Columbia—only the finest quality procurable is sawn for our No. 1 Clear Tank grade stock—a tight grained wood, free from sap, shake, hearts and all knots, excepting a few fine pin knots.

White Pine is a Northern Ontario product and is also of special selection.

Cypress—otherwise known as Gulf Red Cypress—grows in the Southern United States and is similar in quality to our B.C. Fir, although more adaptable in special installations.

TORONTO No. 1 Tank grade lumber is without question the finest quality sawn—thoroughly air dried before being made into tanks—the user is assured of a most satisfactory product.

TORONTO Tanks are made for any purpose—of any size—for all needs.

FARRFHERN CONDENSATOR

The only machine of the kind designed for service on low pressure Steam Atmospheric and Vapor heating. The distinguishing features are a short sensitive leverage which assures the positive operation at all times. The Steam enters the top of the Tank with the Steam Valve high up, thus preventing flooding of the Steam line. The water ways are large, thereby accelerating the return of condensation and discharge of air.

It is the simplest, most durable and dependable equipment that can be placed on any Steam Heating System.

Secure Your Plumbing Fixtures This Way

"This Way" means the Rawlplug way, because it's **SAFE, SURE, ECONOMICAL** and **EASY!**

Every up-to-date plumber and builder knows Rawlplugs and uses them—because they assure better workmanship than other types of Screw anchors. Always a **SURE grip**—a permanent hold—in any material!

Rawlplugs are made of stiffened strands of jute fibre

which expand and become so imbedded that they actually become part of the surrounding material.

Rawlplugs are used by Canada's leading plumbers, builders, electricians and engineers because they are men who know the advantages of "Expansion Means Grip"—Rawlplugs' exclusive feature.

How about letting us send you a few samples—free?

Gentlemen:—We would like to try Rawlplugs and would appreciate a few samples.

Name

Address

The Banner Pipeless is Different

BECAUSE:—

The Banner Pipeless has two casings—the outer casing taking the place of the usual cold-air flue. The warm air rises directly to a larger register over the top of the furnace. This register is divided into two parts, the centre part serving as a warm air register. The outer part acts as a cold air register, drawing cold air down the flue which is formed by the outer casing of the furnace. The outer cold air flue keeps the outer casing always cool so that it is quite safe to keep vegetables and fruit near the furnace. A warm house and a cool cellar is the result.

We manufacture also the Banner Pipe Furnace and the Banner Pipeless Wood Furnace.

Write to-day for attractive agency proposition.

WANT ADS

If you want a buyer, clerk, salesman, traveler, position, you can reach the best men in the trade through these columns.

If you wish to buy or sell a business, or dispose of overstocks, you can reach a larger number of sanitary engineers through this page than in any other way.

Rates (payable in advance) 2 cents per word. An additional charge of 10 cents for each insertion is made when Box Number is required. Each figure counts as one word. When panels are desired a charge of \$2.00 is made for a panel 1 inch deep by 2½ inches wide. Address all advertisements for this section to SANITARY ENGINEER, 143-153 University Avenue, Toronto, Canada.

SALESMAN

with real selling ability and able to direct sales activities in connection with Hot Water and Steam Heating Lines, also plumbers' supplies. Must be fully conversant with French and English languages, also in complete sympathy with all classes of the trade in Provinces of Quebec and Ontario. Age not over 40 years preferred. Advancement assured if ability demonstrated.

Box 206, Sanitary Engineer,
Toronto.

Are These The Opportunities You're Looking For?

Fan Heating and Ventilating Engineering is the pinnacle of all other forms of heating, and of all branches of steam fitting and sheet metal work. It prepares you for:

1. For Employers it enlarges their business opportunities 100%.
2. Employees it raises to Foremanship of a large shop.
3. Or as Designing Engineer of some large Heating Contractor.
4. As an intelligent Salesman of Heating Appliances.
5. As Chief Engineer with a Heating or Furnace Manufacturing Company.
6. Later a Consulting Engineer to Architects and Building Contractors, etc.

Which of These Are You Working for?

"Yes, Madam, Your Husband was a Careful Investor"

*Will your banker be able to
give your widow this assurance?*

YOU do not save money for the mere joy of having it. You have a definite purpose in view. It may be to protect your own later years; to educate your children and start them out in life or to sustain your widow and dependents should you yourself pass on.

For these purposes you save—and invest what you save. It is a sacred trust. To fulfill it you must put that which you save where it will be safe, first, and produce a good income, second. You do this by investing.

Only carefully made investments will achieve your ends. Careful investing requires reliable information.

You can get this necessary sound information and advice weekly in The Financial Post.

Nine thousand other Canadian business men subscribe to it and look to it for news and advice concerning stocks, bonds, mortgages, insurance and business policies in general.

Do the same yourself. Subscribe to-day. Lay the foundation of your fortune on the solid rock of knowledge.

When you have filled in this coupon and attached your cheque for \$5 you have assured yourself of 52 issues full of meaty, intelligible, readable business and investment news. Better do it now.

Which One Instals GRIFFITH All-Metal Septic Tanks?

One of these sanitary engineers is a sterling craftsman and a good salesman, but he is continually out of luck on sewage disposal contracts.

He instals old fashioned septic tanks; delays caused by bricklayers and masons nearly always eat up his profits.

His smiling friend on the right sells the Griffith tank exclusively. He makes but one trip to the job; connects up at once and goes on his way to more sales and more profits.

When in doubt about the layout of a job he puts his problems up to our service department. We put him right.

He makes more money, saves more time and gets more business selling Griffith's lines. Why shouldn't he smile?

Our New Style Emco No. 881 Disc Radiator Steam Valve Has Met With Instant Response

No. 881

This valve has only recently been placed upon the market yet sale has eclipsed even our expectations.

Our No. 881 is equipped with baked enamel mushroom type wood wheels, has a composition disc which may be renewed easily and may be repacked with the valve open.

The No. 881 has not only been made with the idea in mind to perfect a valve which will give constant and dependable service but to make as handsome a product as can be produced.

All Emco products are tested under pressure before leaving the factory and under a much greater pressure than that to which the product will be subjected.

Emco valves save you time and worry on your installations. Of course they carry the Emco guarantee. See your jobber or write us.

Everybody wants a quiet closet

Nothing is more embarrassing in the home, and particularly with guests, than a noisy flushing closet. Even in the installation of a very modest toilet-room, the added refinement of a quiet closet is appreciated. And the desire is so easily gratified by furnishing the Quietus-Bellemeade combination illustrated. The moderate cost of this outfit should make it practicable for almost every household. The labor cost of installation is no greater than for a less desirable fixture.

The superiority of this closet combination exists in its being of syphon jet type, extremely quiet in operation, and possessing outstanding sanitary characteristics. Both closet and tank are made of SOLID VITREOUS ware, hard-burned, all-clay, vitreous through and through, proof against the absorption of dangerous acids, and with a clear white deep glaze surface, possessing no affinity for dirt or germs, as smooth and as easily kept clean as a china plate.

When Time is a Vital Factor

A BROKEN COG in a gear or a crack in the fly-wheel may tie up your plant. Breaks in machinery cause costly delays. Oxy-Acetylene welding and cutting is saving thousands of dollars yearly in effecting quick repairs.

That is when Dominion Service proves up. The purity of Dominion Oxygen and Prest-O-Lite Acetylene, assures the hottest flame and the utmost economy in fuel. The easily-handled cylinders permit the placing of the welding and cutting equipment within working distance of the job, which alone saves valuable time.

Dominion Service is equally good for the small welding and cutting shop, manufacturing plants, and big shipyards or railroads. If you use welding and cutting in your business, or contemplate the use of the oxy-acetylene process, either in production or for general repair work, it will pay you to know about Dominion Service.

Our representative will welcome the opportunity of telling you how Dominion Service will benefit your business.

Building Reputation and Profits

Long and satisfying service from sanitation and heating installations is a factor in developing a reputation which will pay added profits by attracting new business while holding your present trade. Crane valves, fittings and fixtures give this service because they are designed and produced in accordance with the highest engineering standards.

Lower installation costs follow the specification of Crane equipment. All parts are manufactured with the greatest precision—nipples are chamfered to make the threads start more readily and all fittings are machined to insure tight joints at the first assembly. The wide variety afforded in Crane bathtubs, lavatories, closets, kitchen sinks and laundry fixtures assures pleased customers.

The Great Fall Drive

The Anthes Syphon
"The Heart of the Sewage Disposal System"

As a skilful general makes profitable use of every minute of favorable weather—so are all wide-awake Sanitary Engineers taking advantage of these glorious autumn days.

The great fall drive for rural sanitation business is now in full swing right across the country.

Everywhere sanitary engineers are pressing forward to new sales successes in these last weeks of active campaigning.

Aggressive selling, and the threat of compelling him to spend another winter wide open to the flank attacks of Jack Frost, is causing many a "tough" prospect to surrender unconditionally and to accept the Sanitary Engineer's proposals for the installation of complete sanitary equipment.

Join this conquering army. Get your share of the spoils.

Says 90% of Sales of Plumbing Equipment Are Influenced by Housewives

Starting With Small Capital, T. Winters, Kitchener, Ont., Has Developed Prosperous Business on Foundation of Fundamental Business Principles—Keeping the Goods Out Where They Can be Seen and Help Sell Themselves

“ONE of the very finest shops we have seen anywhere,” is what men in the trade and travellers, both American and Canadian, say of the business premises of T. Winters, at Kitchener, Ont.

Starting with capital that was anything but large, but with high ideals of service and selling, Mr. Winters has built up a most prosperous business, and one that is known not only in Kitchener, but for miles around.

It was some time before he accumulated the capital necessary to equip a shop such as he wanted, but right from the start he made it a point of always keeping what stock he had in spotless condition, and ready for inspection by any prospective buyer, man or woman.

An Important Point

One of the most essential points in selling he believes is to keep the merchandise which is offered looking its best. Unfortunately he points out this is not always realized by men in the trade. It is equally important also from a selling

point, he says, to combine as effectively as possible various lines of merchandise which naturally group themselves together in everyday use.

In his store and window displays, for instance, Mr. Winters is careful to keep bath room equipment separate from kitchen equipment and furnaces and heating apparatus separate from either. Similarly he keeps bath room fixtures in a place by themselves.

Displays Essential

Mr. Winters holds the view that no sanitary engineer can possibly make a mistake in keeping too much merchandise out where his prospective customers can see it. Many of the men in the trade, he believes, could treble and quadruple their business if they would only keep their goods out where they can be seen and keep them in such shape that men and women who are building houses can come in and talk about what they want to buy.

Interior of the well-lighted and attractively arranged plumbing showroom of T. Winters, Kitchener, Ont. The arrangement of the equipment, classifying bathroom, kitchen and laundry equipment separately, is described in the article. This showroom brings much business.

A corner of the plumbing and heating showroom of T. Winters, Kitchener, Ont., showing hot water equipment, laundry tubs, kitchen sinks, etc. Note the attractive board with black background showing up the white fixtures prominently. Such a showing is a fitting background for the window display and it is used for this purpose.

One of the most successful features of the large turnover in his own business, he says, has been the real service he has been able to render home owners and the community in general, by suggestions as to how they can improve their homes. A very large percentage of the people in any city or district, he says, are constantly interested in home improvements, and especially in various lines of plumbing goods. By keeping constantly before the people of Kitchener and vicinity, ideas for attractive bath rooms, for modern kitchens, for better heating, etc., Mr. Winters has been able not only to build up a large and steadily growing trade for himself, but he has the very real satisfaction of knowing that by what he calls "real service," he has helped in making hundreds of homes better, healthier and more convenient. This applies almost equally to homes in the rural districts, as well as in the city.

Are Keenly Interested

Farmers, he finds, are keenly interested in suggestions that will make their homes better and more comfortable. Suggestions such as are shown in the accompanying illustrations are constantly "pulling" splendid business for Mr. Winters. One day it is an inquiry for a water pressure system. Another time it is a query about a bath room outfit or a heating system. The best part of it all is, Mr. Winters says, that his window and store displays never lose their "pep."

The reason for this undoubtedly lies in the fact that he constantly keeps a large assortment of plumbing goods constantly before his prospective clients.

At nights his windows are splendidly lighted and day in and day out, week in and week out all through the year, Mr. Winters gets business that is directly traceable to his displays.

From Long Distances

In these days when automobiles have cut distances down so that 50 and 60 miles mean nothing, he finds that his windows are frequently inspected by home owners who reside a long way from Kitchener. Many of these inspections result in queries by mail or by personal call, and when followed up, result in profitable installations.

One of the most profitable angles to his displays, he says, is in the business they bring in direct from home owners in the city. Few cities in the Dominion have such a large percentage of comfortable, well built, well equipped, modern homes, at Kitchener. The people are well to do and thrifty. They have the means to instal modern plumbing equipment and they do it. This tendency, of course, offers a wide opportunity for business that Mr. Winter takes full advantage of and his very best way of coralling such trade, he says, is his store and window displays.

Watch the Women

Time after time he has had a man or woman come in to ask about equipment on display. Very often it is the woman who comes in. Incidentally Mr. Winter points out it is the housewife who is instrumental in taking the initiative in sanitary improvements in about 90 cases out of 100. Every woman, he believes, wants a nice home and is keenly interested in having in it

equipment that will make for better living conditions or more comfort. At any rate he finds that it is very often the woman who comes in to discuss with him installations either for a new home or for improvements in an existing home. This is usually an investigation trip on the woman's part. She wants to get information both as to what is the best equipment and how much it is going to cost. Having obtained these facts, she figures out what she wants and then brings hubby down to assist in making the selection.

Has Been Profitable

Just how profitable it has been for him to keep his premises so that any woman can come in and inspect goods without fear of mussing up her dress, Mr. Winters is unable to say, but he figures that it runs into large figures. No woman, especially clean, thrifty housekeepers, he says, want to go into a place of business where ill kept, dusty, dirty merchandise is kept. The sooner men in the trade realize this the sooner he believes they are going to get busy and clean up and cash in on some real profits that are waiting for the picking.

On the other hand he finds that women, and their husbands, too, for that matter, who have come to him for information and suggestions, and have made installations, never tire of sending their friends or of talking about the shop and its service.

A Splendid Advertisement

"It is the old story," said Mr. Winters, "there is no better advertisement than a satisfied customer. It

doesn't make any difference whether the party lives in the country or the city. If they come in and get the information they want and then improve their homes by putting in a bath, or a heating system or some other equipment, they never stop talking about it. I have got a very appreciable amount of good business through satisfied customers and it is constantly coming in."

"Sanitary" means something very real in the policy of Mr. Winters. As will be seen from the accompanying illustrations, he aims to live up to his ideals of the profession in every way. The interior of his shop is painted white and is kept in perfect condition. The furnaces on display are kept in A1 condition, being painted regularly and dusted carefully. Every bit of enamelware and every piece of nicked goods is looking its best and ready at any time for inspection by the most fastidious home owner.

Another thing that helps sales, says Mr. Winters, is the keeping of as wide a range as possible of style of merchandise. Some home owners, he points out, can afford pedestal basins. Others can only afford the ordinary kind. Some people can buy one kind of fixtures. Others want a less costly variety. All, however, he finds are very keenly interested in seeing exactly how the fixtures or equipment will look when installed and it is a very real help in closing sales to be able to take them over to a display and let them see it just as it will look in their home.

"People greatly appreciate the ideas they get from my shop displays," says Mr. Winters. "Very frequently I find

that their own ideas regarding arrangement are somewhat vague. When I can take them over and show them exactly how a set of laundry tubs or a bath room outfit will look it usually cinches the sale. More than this, it gives them a very favorable impression of the firm. They seem to argue involuntarily, 'Here is a man who knows from experience what he is talking about and his ideas are valuable.' They listen more readily to suggestion, and it is easier to close up business."

As will be seen from the photos, Mr. Winters keeps special displays of bath-

room fixtures in conspicuous places. He finds it very profitable to do so. There are any number of homes in which there are possibilities for selling fixtures. Some people buy them in whole sets. Some people buy one fixture at a time. Some people buy them for gifts. There is, however, Mr. Winters says, a constant call for them and in accordance with his general shop policy he keeps his bath room fixtures displayed so that he is not only not ashamed to have anyone look at them, but so that they usually "sell" themselves.

Functions of Various Trading Branches

Wholesalers, Manufacturers, and Retailers Outline Scope in Distributing Necessities of Life With Aid of New Commerce Bureau

RECENTLY representatives of the manufacturing and distributing industries of the necessities of life were called together under the newly-created Domestic Commerce Division of the Department of Commerce for a study of the complex production and distribution problems growing out of present-day conditions.

The bureau has described briefly but accurately various functions as social factors.

The wholesalers, after careful thought, offered the following definition:

"It is the wholesaler's function to carry a well-selected stock of merchandise; to buy suitable quantities, to ware-

house a reserve stock for retailers, within a radius of economic distribution and convenience of service, and to resell in proper units to retailers."

The manufacturers, with the same care, phrased the definition of their contribution in the following terms:

"It is the function of the manufacturers to supply commodities economically produced to best meet the requirements, needs and tastes of the public, utilizing the experience, methods and equipment at command, to serve these ends."

The retailers accepted the definition of the retailers' function, as outlined in (Continued on page 17)

Bathroom requirements, with small appliances attached are shown prominently in this display which also shows hot water furnaces. Note the use of wall cabinets and orderly arrangement of towel bars, valves, etc. On the left, in full view from the street, a range boiler is shown with connections for both electricity and gas.

Sales Tax Included in Price Quoted, Say New Tax Regulations

Some Technicalities in Connection with Proposed Tax Regulations Cleared up by Issuance to Collectors of Definite Regulations—Unlicensed Jobber Selling to Licensed Party Cleared by Stating on Invoice That Price Does Not Include Sales Tax—Returned Goods

IN THE time which has elapsed since the draft regulations of the new Sales Tax were prepared and sent out to manufacturing and other interests in Canada, an opportunity has been given for representations to be made by various branches of trade, and as a result of such representations the regulations have now been put in more definite shape and sent out to officers of the Department of Customs. The notices now issued contain the final form of the regulations adopted by the department after studying the comments received on the draft proposals.

One of the most important provisions is the following: "Licensed manufacturers and licensed wholesalers, when selling to retailers or consumers, shall not show the tax as a separate item on the invoice. The provisions of paragraph (b) Subsection 12, Section 19, BBB, will be deemed to have been complied with if, when the unlicensed wholesaler sells to the licensed manufacturer or licensed wholesaler, he states on his invoice that the price of the goods does not include sales tax."

As Sanitary Engineer secured a copy of the new regulations just before going to press, only a brief review of them can be made herewith:

Quote License Number

Annual fee for a license is \$2. payable on April 1 of each year.

Every licensed manufacturer or licensed wholesaler when purchasing or importing goods for further manufacture or for resale shall quote his license number and certify on the order or entry that such goods are for resale.

Licensees shall not quote license number nor give a certificate as above when purchasing or importing plant equipment, articles or goods for their own use and not for resale.

Licensed manufacturers shall not quote their license number when purchasing or importing goods to be used in, wrought into or attached to articles specified as exempt from sales tax.

The provisions governing monthly returns are about the same as formerly, provision being made on such returns for separating amounts of non-taxable sales and taxable sales.

When the portion of goods exempt from tax exceeds one-third of the value of all of the materials used in the manu-

facture or production of goods as referred to in Subsection 3 of Section 19-BBB the manufacturer shall take out a license and pay sales tax on his sales.

The section dealing with refunds and deductions is as follows: "Licensed manufacturers or wholesalers who desire to make application for deduction of sales tax paid on materials on hand on Jan. 1, 1924, in respect of goods which have been or are to be used in, wrought into or attached to articles to be manufactured, which articles are subject to sales tax, shall signify their intention of doing so in writing to the Collector of Customs before Dec. 1 next and make an inventory of the goods upon which claim is to be filed.

"Such inventory shall show a description of the goods and trade number, if any, and the quantity and value of each kind of goods, such value being the value upon which tax was actually paid. Each item shall be serially numbered. Goods in transit on Jan. 1 upon which tax was paid or payable shall be regarded as goods on hand.

"Goods in the hands of licensed manufacturers, producers or licensed whole-

salers on Jan. 1 for resale in the condition in which imported or purchased by them are to be included in the inventory of such licensed manufacturer, producer or wholesaler. When the goods are sold the invoices therefor shall be marked with a notation that the tax was paid prior to Jan. 1 and the Collector of Customs shall be notified and the inventory claim reduced accordingly. Claims for total amount of deduction, together with complete evidence, must be submitted before June 30, 1924. Licensed manufacturers may make deductions on their tax returns for the tax paid before Jan. 1, 1924, on materials used in the manufacture of goods up to the close of the period covered by that return."

Conducting Retail Branch

Licensed manufacturers or wholesalers who also conduct a retail branch shall keep separate records for each of such branches and not use their license in connection with importations or purchases for the retail branch.

In respect of goods subject to sales tax sold by retail by the manufacturer in Canada, the value of the goods for purpose of tax will be determined by the Minister of Customs in each class of cases. In respect of goods subject to sales tax sold or transferred by the manufacturer or producer thereof in Canada to his own wholesale houses, the value for purposes of the tax shall not be less than the wholesale price.

Licensed manufacturers and wholesalers dealing in goods shipped in returnable packages may make to the government not later than the end of March each year an annual consumption or sales tax return as to such packages instead of monthly returns, and the tax so payable shall be paid on the difference between the amount charged for returnable containers shipped during the year and the equivalent amount rebated for containers returned during that period.

Concerning returned goods, provision is made that where goods are returned as unsatisfactory or damaged in transit and goods of the same value are supplied in exchange, no charge being made for goods so supplied, no tax is applicable on goods supplied. If the goods supplied are of greater value, sales tax is collectible on difference in value. If of

(Continued on page 18)

SALIENT POINTS OF THE NEW REGULATIONS

Tax not to be shown as a separate item on the invoice.

Unlicensed wholesaler selling to licensed parties can state on invoice "price does not include sales tax."

Goods on hand January 1 to be included in inventory. When subsequently sold invoices are to be marked with notation that tax was paid prior to January 1.

Goods transferred by manufacturer to own wholesale department shall be valued for taxation at not less than wholesale price.

Provision made for refund of tax on returned and damaged goods.

Certain oils exempt from tax when used for ship's stores.

No tax payable on repairs except in respect of material supplied.

Custom work done for licensed parties not subject to tax.

Sales tax not to apply on charge for freight involved in price of article as appearing on invoice.

Is There Such a Thing as Legitimate Stealing in Plumbing Business?

How Many Plumbers Know Overhead or Cost of Doing Business and Their Volume of Business? How Many Pay Themselves a Salary, Limit Expenses, Charge Themselves for Goods Taken From the Business, etc.?

Written for Sanitary Engineer by C. D. HENDERSON, President Henderson Business Service, Ltd., Brantford, Ont.

ORDINARILY to call a man a thief would be to flirt with the undertaker but when no names are mentioned and one can enjoy the protection of the press it's worth chancing especially when it is done with a worthy object in view.

Some time ago I attended a meeting of sanitary engineers and during a discussion of business subjects we asked a few questions. The answers proved conclusively the suspicions I have had for some time that the average merchant cheats himself, cheats his business and his family, in fact, in plain English he is a thief.

Now wait a minute before you call me a liar or any other pet names. Read the following questions which were asked at the meeting along with the answers—by the way there were about 100 sanitary engineers present.

Q.—How many in the room know exactly their overhead expense or cost of doing business and their volume of business?

A.—10.

Q.—How many men pay themselves a regular salary?

A.—16.

Q.—How many of you limit your expenses to your salary?

A.—None.

Q.—How many of you pay yourselves the salary to which you are entitled?

A.—None.

Q.—How many of you charge to yourselves goods which you take from your own business?

A.—8.

Q.—How many of you pay cash for what you take from your business?

A.—None.

Q.—How many of you run contra accounts with other merchants and when settlement is made charge the amounts of these contra accounts against yourselves?

A.—15.

Q.—How many present have relatives help them out in the office or store occasionally?

A.—53.

Q.—How many of these 53 pay these relatives for services rendered. I mean pay in actual cash?

A.—6.

WHY SO FEW ARE SUCCESSFUL

Now in view of these admissions is it any wonder that only about three per cent. of those engaged in the business make a success of it? Does it not coincide with the mercan-

tile agencies' contention that 73 per cent. of the failures are from personal causes (that is the fault of the man himself)?

All of us realize that in order to know where we are at and where we are going we should pay ourselves a salary for managing the business—we know that every article taken from the business for self or family should be charged against us and paid for—surely the laborer is worthy of his hire and every person who performs a service for the business whether they are relatives or not should be reimbursed, otherwise how in the name of common sense is it possible to determine whether the business is a paying proposition or a white elephant?

Why do we not do the things which we admit are right and businesslike? Because it is not the easiest way—because it means a little sacrifice. The average sanitary engineer prefers to take from his own business what he wants for himself and family whether it be cash or goods. He knows it's not business but he prefers to shut his eyes at this point and to go to it blind hoping by some act of providence that he will come out all right.

Yet this same man if his business were formed into a limited stock company or a partnership or if it became one of a chain of stores would receive a stated salary as manager and he and his family would have to live within this salary. Any materials taken from the business would be charged up to him and he would have to pay for them as would any other employee.

What does this all mean? Simply that under compulsion we can and will do the things we will not do when left to our own commands of conscience.

QUESTION OF SALARY

The salary a man should pay himself should not be confused with profits which every business man should aim to obtain

PLUMBER HAS UNIQUE PLAN OF REMUNERATION

A number of varying plans of remuneration are in effect among plumbers, some of which are described in this article. One plumber pays himself \$1.50 per hour and records every hour as a charge against administration or a job. Others pay themselves a salary.

over and above the costs of doing business. Salary is remuneration due the owner for managing the business, the same as salaries paid to other employees—it is a charge against the cost of doing business.

Now the question arises what should a man pay himself for managing his own business? This is not a question easily answered without knowing all the details affecting the particular business; however, actual experience coupled with considerable investigation on this subject, prompts me to offer the following food for thought:—

1. Investigations in other lines of business show that the salaries of managers run approximately 8 per cent. of the volume.
2. In arriving at a proper figure, find out about what you would have to pay a man as capable as yourself to come in and manage the business.
3. Some sanitary engineers pay themselves a salary equal to 50 per cent. more than they pay their best journeyman.
4. Others pay themselves a figure equal to what they believe they could earn elsewhere in a similar position.
5. An Ontario sanitary engineer who conducts a combination jobbing and contracting business keeps a time sheet and records every hour he spends, paying himself \$1.50 per hour.

The point is, adopt some method and stick to it. Draw your salary every week along with the other employees and open up a separate bank account for you and your wife to draw against. Then at the end of the year you will know whether or not your business is a profitable one and your wife will be in a better position to manage that great institution, the home, as both of you would like to see it.

The day of easy money with its first cousin careless methods is gone forever. To-day it is a case of the survival of the fittest. This does not necessarily mean that big business will eat up the small business man. On the contrary the small merchant who studies his business, gives service, keeps down overhead, knows where he is going from day to day and attends to his knitting has as bright a future at as any time in the history of business.

St. Raphael, Ont.—Roofing and plumbing contracts for \$40,000 convent, owned by parish of St. Raphael, have been let to J. J. Breard, 1277 St. Dominique St., Montreal.

Work of Government Demonstration Truck Misunderstood by Many in the Trade

Lack of Progressive Foresight on Part of Sanitary Engineers—
Petty Jealousy the Root of the Matter—Trade Should Co-operate
Independently With Work of Government Demonstration Truck

By EDWIN NEWSOME, Consulting Sanitary and Heating Engineer, who conducted
five months' series of lectures from the floor of the demonstration truck.

THAT the sanitary and heating industry appears to have in some way imbibed or become rather overloaded with shortsightedness, and petty jealousy cannot be easily overlooked. Even in the very rank and file of both manufacturers, jobbers and plumbing contractors alike, the same distrust, the same jealous feelings, are easily scented by any student of human nature.

The manufacturer who has the backbone to suggest any plan to improve conditions is at once "set upon" by all and sundry engaged in like business.

He is charged with having his dice loaded, and so on. The jobber, too, spends most of his time in discussing the underhanded selling policy of the other fellow and Ye Gods! if a progressive plumbing contractor has the nerve to call a meeting of the craft, with the object of overcoming some of the evils which the craft has been struggling against for many a century, every telephone in the locality is busy, one and another of the trade are phoning up to find out if the other fellow has any idea what our nervy craftsman has up his sleeve.

Even the Ontario Government, it appears, or at least the demonstrator of the truck has now come under suspicion. What is the matter with the craft? Just this: The whole industry is being coaxed to sell its wares. It has no sales policy. It doesn't have to sell. The law of natural progress demands that our incorporated towns and cities, every house when built must be equipped with a bathroom, and only those who live in such incorporated districts are selling the service of an industry which is second to none in possibilities. An industry which, in fact, has, up to date, only catered to city dwellers, leaving over 70 per cent. of our population severely alone, to live in "unplumbed" houses, forever and ever, Amen (so let it be).

Demonstration Truck Work Explained

When, in the year 1913, I became editor of Sanitary Engineer, I had an idea that in view of the fact that contract work in towns and cities was so competitive and profitless, that farm and rural houses would provide lots of work for the craft if properly catered to. As a matter of fact, there are isolated cases

where many members of the trade have left "city work" severely alone and have catered to the rural population, and in every case a lucrative and steadily expanding business has been the outcome.

I do not wish to appear boastful but I believe I have written more on this subject than any other person in Canada, under various nom-de-plumes, in trade papers, booklets, farm papers and in small town local newspapers. Last November I was appointed lecturer on the subjects of rural sanitation, sewage disposal systems and water supply, by the Agricultural Department of the Ontario Government.

These lectures resulted in actual business for several members of the trade who linked up their efforts with the work. While, sad to say, too many members of the craft have looked upon the work with suspicion.

After the expiration of one course of lectures, the question of extending the work was taken up, and I was asked to meet a committee of the Provincial members of Parliament, viz., the committee on agriculture, and a number of plans

VALUE OF GOV'T. LECTURES

"Newsome, if I had not heard you lecture on the subject of modern bathrooms in rural homes at the consolidated school last spring, I'd never have thought of having one put in my home."—Jas. McDonald, the Collector of Customs in Wellington made the above statement. This job cost \$1,300.

were discussed, it finally being decided that if the farmer's home could be fitted up with city conveniences, he, the farmer and his whole family, would be happier and healthier in such a home. But to show the farmer how this change could be made was a problem, and after discussing it, in and out of committee, it was decided to take steps to show the farmer just what he could have and the cost, as well as the real working, plan-

ning and layout of sanitary equipment in his home. And finally a decision was arrived at that a truck be fitted up complete with running water, etc., and be taken out to the door (as it were) of the farmer and rural resident.

I was then asked to work out the details, which I did, and later on was appointed by the government to fit up the truck. A man was procured to drive it, and assist where possible, to give advice to those who visited the truck. Bills and other forms of advertising were distributed and a five months' tour planned ahead, which took in the work of lecturing in 120 Ontario villages, towns and cities, and much information was given out.

Some of the bills distributed no doubt appeared to infer that the farmer would be shown how to do the actual work of installing his own plumbing. But those who know the lecturer, those who know their own business, also must know full well that a trade which has heretofore required years of study to make a man competent, could not be learned by any one receiving a few hours' instruction, and the lecturer knowing the business, would never attempt to fool his audience by telling them how to instal their own plumbing.

No doubt a few pointers were given out as to how to make simple repairs, put a washer on a faucet and so on, but who in the world wants such business these days? And who in the world would want a farmer to phone, write or otherwise acquaint a member of the craft with the fact that a faucet was leaking, particularly when it would require a 10, 20 or 30 mile drive. As a matter of fact, the farmer has been scared stiff with the idea that every minor repair to his plumbing (if he got it put in his home) would require a plumber to fix it, and therefore he has refrained from having city conveniences put in his home, to the detriment of his whole family and the sanitary engineering industry as well.

Something Must be Done

And the work of the truck went on. It will be out on the road next year. Lectures of a similar nature will be conducted in 12 counties this winter, and the importance of "city conveniences on the farm" will be enlarged on. But who is going to get the business? Not the

WHAT WOULD HAPPEN?

If every cent invested in the auto industry were withdrawn, if every auto was lost to the world, if every garage and auto industry were closed up, and no more cars could be procured, the world would still go on. But if Sanitary Engineering, plumbing fixtures and all modern bathrooms were cleared off the face of the earth and no more could be made, what would happen to civilization?

petty jealous man, not the fellow who thinks more of putting washers on faucets than installing a whole equipment, not the plumber who thinks he has a life-time strangle hold on every little repair to plumbing.

No! Such men, as a matter of fact, are wasting good food, taking up good room, using good clothes and are doing no good for themselves or anyone else. That sounds like straight-to-the-shoulder talk. The trade have not been given enough heart to heart stuff. But frankly, unless the trade as a whole wakens up, some other men will fill up the gap. Now, where do the trade stand?

Let us look back to the time when automobiles first came into being. Engineers demanded that every driver should be trained in a school of engineering. It was claimed that to drive one of those "gas buggies" was as important and dangerous as driving a locomotive, only more so to the public, because the latter ran on tracks, and so on.

Machinists demanded that none but men serving many years apprenticeship should be allowed to fix these engines of the common road, and even farmers claimed that they went with their lives in their hand when one of these "tin lizzies" was on the road. As a matter of fact, the world was going bughouse, and readers, we are right this minute in the same class as all those latter day obstructionists, and where is this short-sighted policy going to land the industry?

Handy men are going to see good business in installing plumbing in farm houses, just as the handy man has created the thousands and thousands of garages. There are many times more men engaged in the garage business than in the plumbing and heating industry. There are more car owners than bathroom owners. The auto industry is many times larger than the plumbing industry, yet, if every cent invested was withdrawn, if every car was lost to the world, if every garage and auto-factory were to be shut down and the whole auto industry closed up, the world would still go on, But:—

If sanitary engineering, plumbing fixtures, and so on, were all put out of business, what would happen to civil-

ization? Now, there's a question for you, Mr. Reader, you Mr. Manufacturer, and you, Mr. Jobber, to answer. How can you answer it? By dropping that jealousy, by getting busy, by standardization, by working toward the end that that great mass of farm and rural homes shall be fitted up with bathrooms, that all educational work be given all the support possible, that every handy man you know be made more handy and be given a job at installing plumbing in rural homes. And last, but not least, by any means, that less talk and more work be the rule from now on, rather than the exception.

TRADING FUNCTIONS

(Continued from page 13)

the report of the Joint Commission of Agricultural Inquiry:

"The retailer performs the final function of distribution of essential commodities and gives fulfillment to all preceding efforts by making merchandise available to consumers at the time, place, and in the form required by them.

"The retailer's true function is that of serving as a purchasing agent for his community; as such he selects and carries a reserve supply of merchandise to

meet the requirements of the individual consumer.

"When the retailer enters business, he assumes the responsibility of performing a public function, that of providing commodities and services to his community, economically and conveniently, and maintaining such environment as is necessary and desirable to the consumers who support him. If he fails in his responsibility and performs only as a distributing agent for the manufacturer, he ceases to be an economic factor in the community which he serves."

WHY? WHY? WHY?

There are many times more owners of autos than bathrooms in Canadian homes. Why?

There are many times more garage men than plumbers. Why?

Over 70 per cent. of Canadian homes lack modern bathrooms. Why?

The auto industry is many times larger than the plumbing industry. Why?

Pipe Fittings Tell Story of the Big Fight

A novel way of attracting attention to the window display was the reproduction in pipe fittings of the figures of Dempsey and Firpo by Wood, Vallance Co., Nelson, B.C., at the time of the recent fight between these two prominent fighters. The figures were made entirely from pipe fittings taken from stock, the idea being the product of the ingenuity of S. P. Bostock, one of the employees of the firm. For a week preceding the fight both figures were erect, but after the result was announced the Firpo figure was laid prostrate.

Standardization of Septic Tanks and Sewage Disposal Systems Necessary

Previous Articles on Subject of Rural Sewage Disposal Based Upon Twenty Years' Experience — Intermittent Discharge is Necessary—Special Plan for Use of Sanitary Engineers

Written for Sanitary Engineer by EDWIN NEWSOME, Lecturer on Rural Sanitation for Ontario Department of Agriculture

THERE is no part of our work at the present day which requires more real study than does the question of sewage disposal systems, and the most important feature in such a system is the intermittent discharge. Next comes the design of the septic tank, which should in all cases comprise a tank with two to three separate compartments, two being the most popular and advisable where the flow of sewage into same is predetermined and reasonably constant as regards the quantity per day per person.

Regarding the importance of the intermittent discharge, it must be recognized first that the effluent or fluid which is free from solids is best disposed of when discharged into mother earth. The soil bacteria then treat this effluent and, of course, the greater the area of ground, the more efficient will the disposing process be. The effluent which is allowed to simply "dribble" away from a compartment cannot possibly be evenly distributed over a wide area because it requires some force to so distribute the effluent.

The most misleading condition is that some soils will absorb more sewage than others, and a state of absorption is taking place, thereby creating a possibly dangerous condition which may take several years to materialize, such as finally polluting every well in the neighborhood.

For example, the writer has been touring the province of Ontario all summer. Scores of cases were found where apparently such "dribbling" tanks have given every satisfaction for several years, but the water in wells all around has become polluted.

Some time ago a farmer's family were taken ill. The doctor could not find out the cause, but suggested that possibly the water was the cause. The farmer was indignant and showed the doctor a sample of the water, which was beautifully clear and no foul odor in evidence. After much persuasion, the water was tested and found to be polluted with sewage. "It cannot be the septic tank," the farmer. "because it has been working for years." It was a "dribbler." To convince the farmer that something was getting into the well that ought not to, he was asked to cease using the plumbing fixtures and to permit no sewage or waste from the fixtures to enter the (septic tank?). This

he did and in less than two weeks time the well went dry. This is an actual case and is not exaggerated one iota.

This septic tank was nearly 100 feet from the well, and it has been stated by so-called health authorities that when sewage has passed through a certain quantity of earth it becomes purified. To such an assumption the writer strongly objects because it cannot be borne out by facts.

Purification of sewage is best and most naturally accomplished when it is discharged intermittently and is effectively distributed over a wide area of ground and into a system of field tile piping which is laid not more than 18 inches below the surface of the ground so as to benefit by nature's three most effective agencies, namely, soil bacteria, which abound in largest quantities at or about the depth referred to; secondly, a natural quantity of air, where the aerobic germ in the soil abounds, and, thirdly, the sun. This latter-named agency assists to keep the sewage warm and throughout the greater part of the year actually evaporates a large quantity of it, a process which cannot be questioned even by the most mercenary person. Anyone who traffics in "contraptions" that are sold to dispose of sewage and do not really dispose, but rather pollute either the soil or water and finally endanger the public health, cannot be other than "mercenary traffickers." If such goods had no bearing upon health matters, the sale of them would simply be so much of a money gain or loss.

The writer does not wish his ideas or experiences to be accepted without question, but rather that some sound principles be adopted based upon the results gained from all parts of the Dominion. At the same time, only the best and most sanitary methods should be adopted so that no apparatus shall be put on the market that will not come up to the best and most practical sanitary standards, and therefore some attempt should be made to that end.

To that end, the accompanying plan, elevation and table has been specially compiled for Sanitary Engineer. The design and whole method has been adopted for over 20 years and absolutely no known complaints have been received by the writer.

Thousands of such systems have been installed and are in use at the present

day. By adopting the plan and design as shown, at least some attempt will have been made toward establishing a standard that to date has stood the acid test for many years.

We would suggest that this sheet be filed for constant reference and if any of our readers wish to procure additional copies, a permanent plate has been made and copies may be procured free on application. Always refer to the page and date of issue in which this illustration appears and thus ensure receiving the one required.

SALES TAX INCLUDED IN PRICE QUOTED, SAYS REGULATIONS

(Continued from page 14)

less value, the amount of tax on such difference may be credited to purchaser unless already paid to the Department of Customs, when credit may be taken on next return. If the goods are not replaced and total purchase price is refunded, the vendor may refund or credit the amount of tax collected or charged to the purchaser. If paid to the Department, credit may be taken in the vendor's next tax return.

When a licensed manufacturer or wholesaler ships taxable goods for which he is required to submit a tax return and if such goods are received in bad condition or destroyed in transit and not returned to shipper, the licensee may make a deduction on his tax return for the tax on amount of the allowance granted by him to the consignee provided that notice of damage or destruction is given in writing to the local Customs Collector within 14 days.

Fuel oil, illuminating oil, lubricating oil, kerosene or coal oil over .725 specific gravity may be delivered free of sales tax for use as ship's stores to any vessel bound on an ocean voyage to a port outside of Canada.

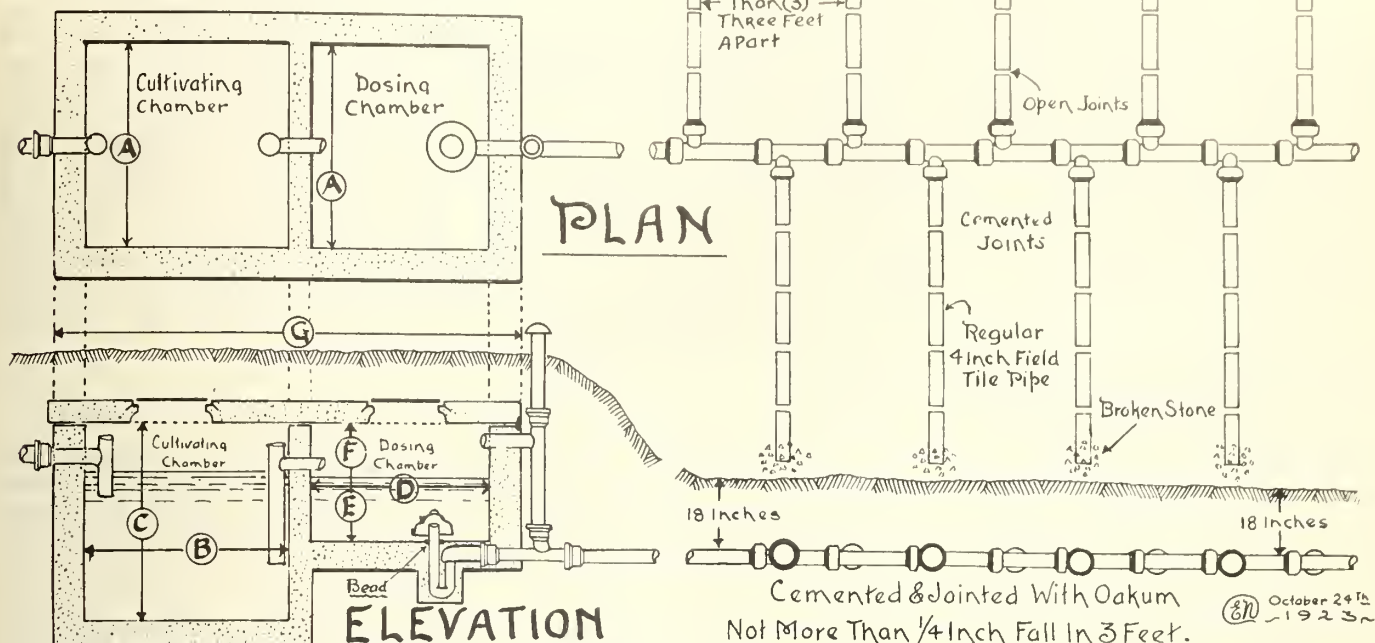

No tax is payable on repairs except in respect of material supplied.

Custom work performed for a licensed manufacturer or wholesaler is not subject to the tax provided they quote sales tax license numbers on the order for such work and certify that the goods are for resale.

Sales tax is not to apply on the charge for freight for transporting a taxable article from a licensed manufacturer to the purchaser provided the charge is shown as a separate item on the invoice.

PLANS AND SPECIFICATIONS FOR SEPTIC TANKS- And Sewage Disposal Systems For Rural Homes And Unsewered Districts.

All Hub Joints Must Be Cemented
All Open Joints Should Be Covered With Coarse Gravel Broken Stone, Railway Cinder Etc.,
All Laterals Must Be At Least 3 Feet Apart—
—Laid Level. $\frac{1}{4}$ Inch Opening, Not More Than 18 Inches Or Less Than 12 Inches Below Surface.

Don't Forget To Install The Syphon Perfectly Level. With Bead At Floor Of Dosing Chamber.
Always Prime The Syphon By Filling Both Legs With Water Before Placing Bell In Position.

September Production of Iron and Steel Shows Slight Drop

THE production of pig iron and ferro-alloys in Canada during the month of September was 75,216 long tons, a decline of 18.8 per cent. from the August production of 92,587 tons. The output of basic pig iron was 27.5 per cent. less at 46,580 tons; foundry iron amounted to 17,536 tons, a decline of 29.8 per cent., while the output of malleable iron showed an increase of 232 per cent. to a total of 11,100 tons.

As usual, practically the whole output of basic pig iron reported was made for the use of the producing firms; but the slackening demand for iron was reflected in the lowered output. September tonnage made for use was only about two-thirds of that reported in August. Foundry iron and malleable iron, on the other hand, were largely made for sale.

Ferro-alloys rose to 2,581 tons, a slight increase over the 2,258 tons in August. The production consisted almost entirely

of the grade containing 15 per cent. silicon content.

Two furnaces at Sault Ste. Marie were banked, leaving seven furnaces in blast at the end of the month, including two at Hamilton, one at Port Colborne, one at Sault Ste. Marie and three at Sydney.

The low output of pig iron in September was reflected in a decreased production of steel ingots and castings, the absolute quantity being 66,334 gross tons as compared with 105,056 tons, the preceding month. Practically the whole of this decline was in the production of basic open hearth steel ingots for the further use of the reporting firms, production of direct steel castings remaining at about the same level as during August.

"WHAT I'VE BEEN LOOKING FOR."

G. L. Rammage, Tottenham, Ont., says: "Sanitary Engineer is just what I've been looking for. The markets are a most useful department."

Orders booked during September for machine tools and other steel products were said to be for small quantities only. Activity in construction has stimulated the demand for machine tools, and dealers also reported an improvement in the quantity of second-hand equipment turned over. Mining development has further stimulated this demand and machinery interests were reported as anticipating an active demand for their products.

WOULD DEVELOP IRON RESOURCES

Fort William, Ont.—The Chamber of Commerce are taking an active interest in the move to secure legislation which will bring into development the iron ore resources now at a standstill. A memorial, to be presented to the government, includes recommendations that a geologist be assigned to the work of surveying the iron ore regions of Ontario; that a mining engineer be retained to keep in touch with the iron ore movement, and that equipment for testing be provided.

Heating and Ventilating Department

Some Good Pointers on Installing and Connecting Warm Air Furnace Pipes

Simple Rules Set Down for Balancing the Supply of Cold Air and Delivery of Warm Air

IN THE following there is much useful information as to the manner of installing and connecting furnace pipes.

Suggestions for Installing Pipe Furnaces

1. Each warm air pipe should have an upward pitch from the heater of not less than one inch per foot.
2. The pitch of all warm air pipes should be alike.
3. All warm air pipes in cellar or basement should be covered with sheet asbestos pipe covering. Not less than 10-pound sheathing is recommended.
4. All warm air risers should be carried up in inside partitions, wherever possible.
5. In cases where it is absolutely necessary to carry up warm air risers in outer walls, such risers should be so thoroughly protected as to be completely insulated.
6. A separate compartment should be made in the crown or bonnet of the surface for each extra long or winding air pipe, thus insuring a positive supply of warm air to that pipe.
7. Never use smaller than eight inch pipe.

8. When warm air pipes are taken out of the top of the bonnet of the heater, the tops of all the elbows should be on a level, so that an equal current of air can fill all the pipes.

Note: As a 12-inch elbow is so much higher than an 8-inch elbow, in order to have both pipes work properly, the top of the 8-inch elbow should be as high as the top of the 12-inch. This applies to all pipes taken from the top of the heater. The same rule applies as nearly as possible where pipes are taken from the side of the bonnet.

9. All warm air pipes should have dampers close to the heater, so the heat from them can be regulated.

10. In heating a room on the cold side of the house, or a room having a large amount of glass surface, place one register in the floor as near as possible to the furnace and place a cold air register face in the floor under or near a window and connect this cold air register by means of a separate duct to the bottom of casing, thus removing the cold air out of the room and at the same time providing a flow of warm air into the room.

Directions and Rules for Cold Air Supply

1. The cold air supply to the heater must be adequate.
2. Always bring in the cold air from the coldest side of the house, west, northwest or north.
3. The cold air openings into the heater should be of equal capacity to all of the warm air pipes.

Stock Sizes of Pipe

Diameter of Round Pipe	Area of Pipe Sq. In.
8	50
9	64
10	78
11	95
12	113
13	132
14	154
15	176
16	201
17	227
18	254
19	283
20	314
21	346
22	380
23	411
24	452

4. A cold air pit under the heater should never be more than 14 inches deep. A pier in centre is desirable to support ash pit where necessary. When more than one air opening, put partition across pit.

5. In connecting cold air box with heater, it is always most desirable to make the connection in the rear of the heater, or by having a cold air pit under the heater.

6. Heaters must have and will have air, and this air should be supplied from the cold air opening at the bottom of the casing. The top of any cold air opening should never be above the level of the grate.

7. The cold air box opening into casing of heater should never be higher than the total height of ash pit and should enter the heater from the rear to obtain the best results.

8. The size of cold air boxes which supply the heater when taken from a main hall or other room down to the heater, should always have the full capacity of all the pipes combined.

9. All return cold air pipes larger than 12-inch should enter a "receiver" at the base of furnace. Pipes smaller than 12 inches may be fastened directly in the casing without use of a "receiver."

The table shows the right size of furnace pipes (lower number shows size of pipe for first floor, upper number size of pipe for second floor) to heat rooms of various dimensions, when two sides are exposed, temperature at register 140 deg., room 70 deg. Outside zero. Room 8 to 17 feet in width assumed to be 9 feet high. Rooms 18 to 20 feet in width assumed to be 10 feet high. For other heights, temperatures or exposures make a suitable allowance. When first-floor pipes are longer than 15 feet, use one size larger than that stated for every 15 feet.

MUST INSTALL PLUMBING

St. John, N. B.—A change in the plumbing and drainage regulations made by the Provincial Health Department will make it necessary for some residents of Fairville and other places not incorporated, but having a water supply system, to instal modern plumbing. There is said to be some objection on the grounds of the expense, but the department points out that it is necessary in the interests of health.

HEAT CIVIC BUILDINGS WITH GAS

Edmonton.—The Northwestern Utilities Co., which is engaged in bringing gas to Edmonton from the Viking field, has entered a contract with the city, under which the civic buildings are to be heated with gas. It is estimated that the city will save \$5,000 a year by substituting gas for coal. Buildings included in the contract are the city hall, four telephone buildings, five fire stations, two public libraries, two public markets, police station, city stores building and the Royal Alexandra hospital.

CANNOT LAY MAINS UNDER C.N.R.

Windsor, Ont.—Because the Canadian National Railway has refused permission to Essex Utilities Commission to use its right of way to lay water mains that will serve filtered water to the border municipalities, plans of the Commission must be revised. The railway cannot allow its property to be used because the property will be needed to extend trackage running into Windsor. The new filtration plant, which will cost approximately \$1 000 000, will be ready in the fall of 1924.

Clean-out Tees on Some Elbows Save the Pipe Abusive Treatment and Facilitate Cleaning

The Sketch of the Design Given Below Shows How a Working Drawing of a Tee of This Sort Can be Quickly Laid Out

Written for Sanitary Engineer by O. W. KOTHE, Principal, St. Louis Technical Institute

ON SMOKEPIPES, and for that matter, also all blow piping and many other forms of piping, it is often necessary to place clean-out tees on the heel of certain elbows. This saves taking the pipe down at intervals, which is always more or less abusive to the pipe, but by having tees in the elbows for clean-outs, the pipes can be blown out with a hose or cleaned with a stick. The design of elbow or the number of pieces of diameter it is to have, does not matter, as in this case we have the 4-piece elbow with the tee set on the centre line of the lower base. This tee can be made any size desired.

After the elbow is designed, we draw the centre line for tee and describe the section M and divide one-half of it in any number of equal spaces, and we drop lines into the elevation. Now to make the proper intersections between the tee and the elbow, we must develop the

mitre line by transferring the section M into plan or N. From the points 1-2-3 in N we draw horizontal lines to intersect the circle for elbow O, in points 1'-2'-3'-4'. From each of these points we erect lines to the first mitre as at 1-2-3-4 and then extend them parallel to each gore piece to the second mitre, then extend them to the third mitre. Now, where these lines intersect those dropped from section M, as in points 1'-2'-3'-4'-3'-2'-1", sketch a curved line and you have the mitre between the tee and the elbow.

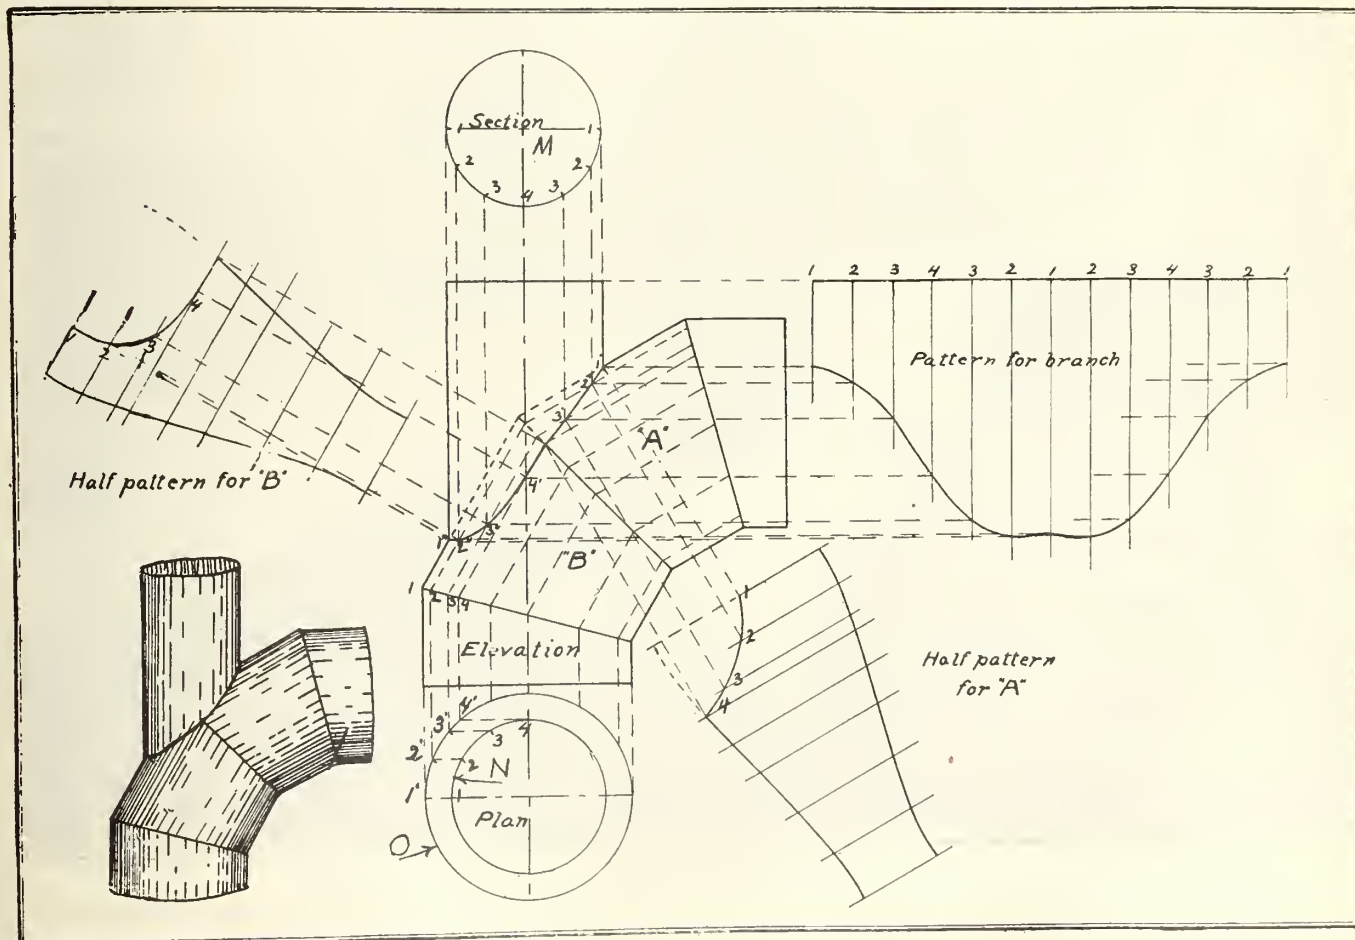

To set off the pattern for tee, pick the girth from N and set it off on a line 1-1 to the right of the elevation. From these points drop stretchout lines and then from each point in mitre line project over lines to intersect similar lines in stretchout. Trace a line through these new intersections and the pattern for branch is finished. Laps for flang-

ing and riveting the longitudinal seam must be allowed extra. The matter of making a rim and a cap to fit over the end of tee is very simple and hardly needs mention.

To set out the patterns for the several pieces of elbow, the general practice is to set the tee on the finished elbow and mark out the opening; but should it be desired to develop the opening in the patterns, then these can be projected much the same as any ordinary elbow is developed. So pick the girth from plan section O as 1'-2'-3'-4', etc., and set it off on a straight line in patterns A and B. The balance of the lines are also picked from the section O and then lines are drawn parallel with those gore pieces of elevation. By projecting lines from the mitre of elevation as 1'-2'-3'-4', also 4'-3'-2'-1", we develop the patterns for the gore pieces A and B. The end pattern can be easily set off the same as has been explained in past issues.

ASBESTOS MERGER SCHEME FAILS

Montreal.—The proposed \$25,000,000 merger of Canadian asbestos corporations will not materialize, according to the statement of the chief executives of one of the leading companies which had agreed to consider the matter. The price fixed for some of the companies is said to have been so low that they would have had to operate at a loss.

Speed Plus Efficiency Motto Appreciated by Plumbers' Customers

Public Antipathy to Workmen Loafing on the Job is Basis of Maritime Plumbers' Unique Advertising—Tells Prospects That Housewife is Not Unnecessarily Troubled by Work to be Done

VERY frequently, in the smaller cities, sanitary and heating engineers can be found who equal at least in progressiveness, their fellow members of the trade in the larger cities.

In Fredericton, N. B., A. F. Betts is located. He was one of the first plumbing and heating contractors to describe himself as "sanitary and heating engineer." Instead of using just his name in his advertising, such as is the case with many others in the trade, Mr. Betts always names his address, his post office box number and the numbers of his two telephones. In this way he simplifies, from the standpoint of the customer, the route between patron and the engineer. He realizes that many in his district and the rural sections of central New Brunswick, do not know the location of his store, and this must be brought home to them. As he special-

izes in mail and telephone orders, he finds it advisable at all times to acquaint the general public with his facilities for handling such orders.

At the present time, Mr. Betts is opening a campaign which he expects to add a stimulus to his business. He believes that many persons object to loafing on the job on the part of journeymen and helpers. So, he has instituted a drive in behalf of speed, plus efficiency. To all those whom he believes would be prospective customers of his, Mr. Betts is directing the following appeal:

"Right here in the shop—we have every necessary appliance for plumbing and steamfitting work. After we have looked over a job, decided upon what is needed, and taken accurate measurements, the good housewife is troubled by us no more till we appear with everything ready to put in its proper place. The

wise people are having us look after their plumbing now."

Retain old customers and acquire new ones by means of the speed-plus-efficiency motto, is now the watchword of the Betts business. Intermingled with a spirit of aggressiveness, this motto is accomplishing much toward stimulating the business of this plumbing and heating contractor.

FIELD SAFETY WEEK CAMPAIGN

Toronto.—A Safety Week campaign was promoted by the Steel Company of Canada, this plan having been adopted to stimulate special interest in the subject among all concerned. According to Ross H. McMaster, vice-president, the campaign aroused much interest among the employees and went a long way toward securing their co-operation in the prevention of unnecessary accidents.

It has been proven repeatedly that the light, attractive showroom has done much in increasing plumbing goods sales among the women customers. This photo shows a simple yet effective arrangement of showroom stock.

How to Raise Your Own Salary

Written for SANITARY ENGINEER, by NAPOLEON HILL

For more than twenty-five years I have been studying people who sell personal services for a living, including, in particular, myself, and have had this regrettable fact forced upon me—that most people make a bad job selling their services, because they try to collect in advance or try to collect far more than they deliver.—The Author.

PERHAPS you have not thought of it in this way, but the truth is, that you have within your power the raising of your own salary.

This is how you do it:

First: Find the sort of work that you love best; the work in which you can pour your best effort with enthusiasm. Go at this work with the determination to render more service and better service than that for which you are paid.

Next, make yourself so agreeable to everyone with whom you work that you will make many friends and no enemies.

So speak of your employer that your fellow-workmen will not become prejudiced against him. Encourage those with whom you work to give a full day's work for a day's wages, which you can do in no better way than that of setting an example by doing this yourself.

If you hear someone slandering your employer, come to his defense, tactfully, but firmly, by preaching a polite little sermon on the virtue of loyalty to those from whom one draws his meal ticket.

When you are off duty, boost your employer and the business in which he is engaged in every way you can. By and by the accumulative effect of this sort of conduct on your part will raise you to the highest position for which you are fitted, and with the highest salary paid for such work.

A short time ago this writer heard the inside story of the Worth business policy of the Worth Department Store. The story was convincing; much more so than any written advertisement ever could have been. The story was told by Miss Gallagher, one of the store's buyers, as she talked of her employers in a spirit of enthusiasm, at a time when she

had not the slightest notion that she was interesting me in the Worth stores. If the Advertising Manager of that store could have told the story to the public just as she told it to a group of people in the drawing room of the home of a friend the afternoon that I heard it, he would fill that store with customers from morning until night.

Inquiry developed the fact that Miss Gallagher started in that store only a short time ago as a stock girl. Passing hundreds of other clerks with a rapidity which they no doubt did not understand why, she was advanced to a high position at a wholesome salary. I doubt if she, herself, understands fully just why she passed the others by. I doubt if she understands that she literally raised her own salary. By nature she happened to be a booster at heart. Might it not be well for those of us who are not loyal boosters by nature, if we deliberately developed this quality?

In the eyes of Miss Gallagher there is no employer on earth quite so fair and worthy as her own. No doubt Mr. Solomon, head of the Worth stores, thinks the same of Miss Gallagher. No doubt he thinks he is setting her salary, but in reality she is setting it herself, by and through her loyalty and her habit of performing more service and better service than she believes she is paid to perform.

You can be a "Miss Gallagher" in your own job, whether you work for Worth Stores or John Smith in Podunk. You can raise your own salary through the self-same principles that have helped this young woman to advance to a high position of responsibility and high pay, ahead of hundreds of others who had the advantage of her in that they had been with the Worth Stores longer than she.

A Big Market

THE typical farm house of the past was about as devoid of plumbing as it could possibly be. What little it did have was probably installed by the farmer himself. Frequently it consisted of nothing more than a kitchen sink with a drain spout of lead pipe extending to the outside of the house and emptying into a trench that drained into a field, or brook.

Times, however, are changing. The farmer is becoming more modern. In the farming districts are to be found the largest number of automobiles per capita. These automobiles are bringing the farmer into closer touch with the outside world. They enable him to make more frequent trips to the village and the city. They are creating a greater desire for all things that are up-to-date.

Everything that will save labor is finding a ready market with the farmer. He is buying tractors, electric power and light plants, oil engines, and everything else that will make the work on the farm easier. Many farm papers are giving a great deal of space to the modernizing of the farm home.

Manufacturers of pumping outfits and electrical appliances are finding a constantly increasing market with the farmers. As a matter of fact, the farm market is in many respects better and larger than the market in the cities.

The farmer is not affected to the same extent by business inflation and business depression as are industrial centres. A country store-keeper, who has been selling to farmers for more than thirty years, states that he has never experienced the great increase in business followed by a serious falling off that is experienced by the average storekeeper in the city. This means that when business has once been cultivated with the farmer it can be depended upon. It is not going to be subject to as great variation as will business in the city.

The Market Around the Corner

QUITE recently, at a meeting of plumbers, someone said, "Business is selling the service that the goods will render."

In these busy days, with the plumber giving more and more time to thoughts of selling, the hazard of "immediate profit" zeal sometime results in failing to learn the complete service that the goods will render. The market before our eyes eclipses the market around the corner.

In selling plumbing appliances, the market before our eyes is the "home" market, gigantic, undersold, waiting for modern labor-saving appliances. It is a primary market, worthy of first consideration.

How big really is it?

The United States Census shows that in 1900 there were 5,127,935 owned homes, free from all encumbrances, in 1920,

6,862,520 "free" homes. "Mortgage free" indicates but one thing—that these owners are well-to-do citizens, able and willing to enjoy the better things of life. They are prospects for extra bathrooms, shower baths, water supply systems if they live in the country, and room heaters and automatic water heaters if their homes are supplied with gas.

It is reasonable to assume that 75% of these homes are supplied with this convenient, economical fuel. Add to this list of what may be termed "preferred prospects," 4,252,447 owners of homes in different stages of encumbrance. These, too, are real gas appliance prospects, in many respects quite as good as the owners of unencumbered or unmortgaged homes.

This, then, is the market before our eyes—the principal market, really awe-inspiring in its selling potentialities.

But don't let us forget the market "around the corner."

Shall I Buy Now?

SINCE the issuance of regulations governing the new Sales Tax, all branches of the trade have been busy figuring out the technicalities as they apply particularly to themselves. As was to be expected with such a drastic change in the principle of collection, much of the misunderstanding which characterized the introduction of the present Sales Tax, is being repeated. While there may be something to be said for the advantages of the new regulations, it is regrettable that such disturbing influences have continually to be brought to bear on the business life of this country at times when many other difficulties beset it. The machinery of the present tax has just now commenced to work with something approaching smoothness when it has largely to be altered.

While there is as yet insufficient information concerning the effect of the new regulations upon all branches of trade to say whether or not the plan is the most practicable, it is quite evident that their application holds some interesting possibilities. Some considerable change in hardware prices is to be expected under the new regulations, a number of lines having already been altered. In at least one case a reduction in price to the retailer is made coincident with the plan of incorporating sales tax in the price quoted, and the odd part of it is that the wholesalers' margin on the line has been reduced. There were some extenuating circumstances in this particular case, but the question arises as to which branch of the distributing machinery is going to be called upon to bear the cost of the tax where the resale price is being left unaltered and the manufacturer is increasing his prices to take care of the tax. In one case the manufacturer is absorbing 1 per cent. of the new tax, increasing prices 5 per cent. Another has eliminated the cash discount, in the meantime pending a decision on future policy. The whole price movement is mixed and it is therefore a time when retailers should watch their sources of information very closely and adjust their buying policy accordingly. In this connection it is well to keep in mind that while there would appear to be an advantage for retailers buying goods prior to December 31, the basis on which various manufacturers are making quotations makes it impossible to set any definite policy applying to all lines. On one line of polishes prices are announced for immediate business, with a 5 per cent. increase after January 1. In such cases some advantage may accrue, but there are other cases where prices now announced include sales tax after January 1, and if bought prior to that time would carry the present 2½ per cent. tax, thus being a disadvantage for immediate buying. The markets require careful watching these days.

The Handling of Men

NOTHING will so hamper a man as too constant supervision, designed to check him up minutely with respect to the details of his work, and if he is a real live, competent individual he will resent such a policy in time and seek employment where he can exercise his powers to the fullest. Further, men prove themselves worthy of responsibility only if they are given full authority in their particular spheres. To say that there is responsibility where there is not full authority, is to express a paradox.

THE executive who disregards his immediate subordinates and deals directly with those immediately under these subordinates or with the workmen themselves, is unjust to the men whom he has placed in positions of authority.

WHEN new people are brought into an organization, due allowance should be made for the change in relationships that is necessitated.

THE executive should study men in order that he may be able to arouse in them the greatest possible amount of initiative. Carnegie adopted the right basis upon which to develop men. He did not care anything at all about a man who did not already look upon himself as a future partner in the business. Cultivate this ideal in your men, give them tasks that will demand all their reserve powers, and then watch them develop initiative.

THE executive should give his workers every opportunity to make good and win their way to positions of responsibility. Many managers seem to be satisfied with nothing less than the polished cut diamond, and have a hard time finding it, whereas if they would look for the uncut diamond "in the rough" they could find plenty of them. A certain rough-and-ready, hard-fisted manager who had the right idea, expressed it in these words: "My business is not to find men; it is to make 'em."

THE manager of the future will not be a manager at all, at least not according to the present interpretation of the term; he will be a co-ordinator and a guide. Primarily, instead of doing, he will decide; rather than counsel, he will seek advice; instead of achieving, he will endeavor to inspire others to achieve. He will not spend his time on details, he will delegate them to others. He will not be a driver, he will lead. Instead of looking at things from the standpoint of dollars, he will consider them from the standpoint of sense. In other words, instead of always asking, "How many dollars can I make?" he will ask the more important question first of all, "How many men can I make?"

Hatched by the Warmth of Courtesy

Minute Message No. 35

Written for Sanitary Engineer by FRANK STOCKDALE
General Selling Series

TURNING a looker into a buyer is a daily opportunity in your shop.

A looker is a buyer "in the shell." Every time one enters your shop, someone has a chance to "hatch out" a customer.

Some stores make a business of hatching them out; others handle them in a way which chills the "eggs" and then complain because business is "rotten."

The wise plumber uses all the warmth of courteous treatment and all the patience of an "incubator" to bring the "lookers" out of their "shells"—"hatched" into satisfied customers.

Some call it salesmanship, but it is only an earnest desire to serve and please.

News Notes From Coast to Coast

Doings in the Plumbing and Heating Industry

NEW FIRMS

Walkerton, Ont.—Sam Fisk and Herb Privat, the latter moving here recently from Owen Sound, have opened a general plumbing and repair business under the firm name of Fisk & Privat.

BUSINESS CHANGES

Revelstoke, B. C.—Sidney Humphrey, local plumber and steamfitter, has moved into his new building opposite the King Edward Hotel. A feature of the new quarters is the large showroom, where a well-assorted stock is being displayed.

Toronto.—Moody & Brooks have taken over the plumbing and heating business formerly conducted at 1375 Bathurst Street by Ross Belyea.

NOT DISCONTINUING BUSINESS

Saskatoon, Sask.—E. Riley, plumber and steamfitter, 414 20th St. West, is not discontinuing business, reports to the effect that he was having been based on mistaken information.

NEW BUILDING PLANNED

Vancouver.—The Army and Navy Veterans' Association have let the general contract for their new \$8,000 clubhouse at Fraser and Forty-fifth Aves. The building will be equipped with hot water heating, the sub-contract for this part of the work not having been let as yet.

TALKS SANITATION TO ROTARIANS

Kamloops, B. C.—At a recent gathering of the Rotary Club, an interesting talk on domestic sanitation was given by A. E. Sjoquist, dealing with the subject both from a local and provincial standpoint. He stated that Kamloops ranked high in the matter of sanitation, out of approximately 900 homes, 98 per cent. having running water, 90 per cent. being connected with the city sewer system, 6 per cent. could connect and should be forced to, and only 4 per cent. have cesspits or tanks.

HYDRO PLAN STEAM GENERATION

Toronto.—In anticipation of the time when the demand for power in Ontario shall exceed the supply at present available, the Ontario Hydro Power Commission is considering plans for the establishment of plants that shall generate electricity by steam. Sir Adam Beck, chairman of the commission, has made this statement, saying that he had been greatly impressed with the possibilities of generation of steam during a recent visit paid to the Ford Motor plant in Detroit.

PERSONAL

Major L. L. Anthes, managing director of the Anthes Foundry Co., is spending three weeks on a shooting trip in Parry Sound.

WILL IMPROVE WATER SUPPLY

Goderich, Ont.—The Water & Light Commission have engaged E. H. Darling of Hamilton as engineer to have charge of the installation of the new intake. Construction will be commenced in the spring, the new intake resulting from pressure brought to bear upon the local authorities by the Provincial Board of Health.

ARTICLES MOST INFORMATIVE.

G. Jobe, tinsmith for F. Butchart, McLeod, Ont., says: "I have followed with interest the patterns and descriptions in the tinsmithing department of Sanitary Engineer, also the articles on cesspools, and have found them all most informative."

ADDITION IS NECESSARY

Simcoe, Ont.—An extension to the Simcoe High School cannot be delayed any longer, according to the inspector who visited here recently. The addition will include several rooms, an extension to the heating plant and the re-plumbing of the whole school.

SEWER SYSTEM IS NECESSARY

Toronto.—Ratepayers of Mount Pleasant are agreed on the necessity of a complete sewer system at once, but will object to any taxation which does not appeal to them as reasonable, according to opinion registered at the opening fall meeting of the Mount Pleasant Ratepayers' Association.

PLUMBER BURIED IN CAVE-IN

London, Ont.—David Egget, of the firm of Egget & Co., plumbers and steamfitters, had a narrow escape from serious injury when the wall of the excavation in which he was working at Byron Sanitarium caved in, burying him in the debris. His most serious injury was a cut on the nose from the shovel of an over-zealous rescuer.

OBITUARY

Brantford, Ont.—Word has been received in this city of the death of W. H. Paulin, in Holland, Man. The late Mr. Paulin was in the plumbing and tin-smithing business on Peel Street here for many years in the premises now occupied by James Holland & Sons. Recently he had been following his trade in Holland, where two of his daughters reside.

WILL AMEND PLUMBING BYLAW

London, Ont.—Acting on a report of Plumbing Inspector Young, a meeting of the plumbers, master plumbers and others interested in the trade, together with the Board of Health and representatives of the Board of Works, is to be held shortly with a view to amending the present plumbing bylaw.

FISH IN STANDPIPE

Bridgeburg, Ont.—Cleaning out the local water standard revealed the cause of Bridgeburg's low water standard to result from a large deposit of silt on the bottom of the big reservoir, while fish of a fair size were found by the workmen. Another test is to be made by the Provincial authorities to ascertain whether the water is now up to standard.

BUILDING WOMEN'S RESIDENCE

Kingston, Ont.—A new residence is to be erected for the women students of Queen's University. Tenders on the roofing, sheet metal, plumbing, heating and ventilating are now being called for by Dr. W. E. McNeill, Registrar, Queen's University, and will be received up to noon, Nov. 8.

VOTE ON CENTRAL HEATING

Winnipeg.—The City Council has decided to submit a bylaw to the ratepayers for the establishment of a \$875,000 central steam heating plant. The ratepayers will be asked to vote on a debenture issue of \$550,000, and approve the scheme for co-ordinating a central steam heating plant with the "Hydro standby plant."

PLUMBING BYLAW THOUGHT TOO STRICT

Ottawa.—After hearing representations of Ald. Nolan at a recent meeting of the Board of Control, that body agreed to ask Plumbing Inspector Nolan to modify some of the interpretations he has been making of the recent amendments to the plumbing bylaw. These interpretations dealt mainly with the counting of house fixtures for the purpose of making charges for water, it being felt that some combinations of equipment were being counted as two which should be counted as one fixture.

Contracts Awarded

Guelph, Ont.—The city council has awarded the plumbing contract in connection with the grand stand to be built to George Fairley.

Hamilton.—The board of education has awarded the ventilating, plumbing and heating contracts on school to be built on Murray St., to Adam Clark, 7 Main St.

Kitchener.—The ventilating contract for the alterations and \$100,000 addition to be built to the House of Refuge has been awarded to Dunker Bros.

Mabou, C. B.—The plumbing and heating contracts for the \$115,000 county asylum has been awarded to W. H. Thorne, Fredericton, N. B.

Mount Dennis, Ont.—Roofing and tin-smithing contracts on the \$20,000 church, Weston Road and Sunnybrae Crescent, has been awarded to F. W. Kidd, 14 Goldwin Ave., and the plastering, heating and plumbing is to be let by the architect, J. F. Brown, King St. E., Toronto.

Ottawa.—The plumbing contract for the \$40,000 fire station, Parkdale and Wellington Sts., has been awarded to Garth Co., Jackson Bldg., and the heating contract to McKinley & Northwood, 54 Rideau St.

Outremont, P.Q.—The plumbing and heating contracts on the \$20,000 hall being built by the Outremont Presbyterian Church have been awarded to A. M. Hayes, 1219 Green Ave.

Selkirk, Man.—The roofing and sheet metal work on the \$27,835 power house being built for the Hospital for Mental Diseases has been let to the Western Steel Products, Ltd., Winnipeg, and the plumbing and heating work to Forbes & Christie, Winnipeg.

Fort William.—The plumbing and heating contracts for \$75,000 store and office building have been awarded to Superior Heating & Plumbing Co.

Hamilton.—The plumbing contract on the Lister Building has been awarded to Wm. Newell, 153 St. James St. S. and the heating contract to the Drake Avery Co.

Toronto.—The plumbing contract in connection with dye house and factory for the Toronto Carpet Mfg. Co. has been let to McNaughton & Mackenzie, 1029 Shaw St.

Montreal.—The plumbing and heating contracts on the \$90,000 apartment house being erected on Atwater Ave. have been awarded to Conroy Bros., and the roofing contract to the Dominion Sheet Metal Works.

Montreal.—The plumbing and heating contracts on \$40,000 residence being erected on Ontario St. for W. D. Hutchins, 79 Lagauchetiere St., have been awarded to J. Colford, 479 Guy St.

Montreal.—Owen Roberts, 6967 Sherbrooke St. W., is the owner and builder of 17 semi-detached residences costing \$140,000. The plumbing contract has

been awarded to Jas. Robertson & Co., and the heating contract to the Imperial Radiator Co.

Ottawa.—The plumbing and heating contracts on \$9,000 residence being built on Central Terrace have been awarded to Murphy and Morrow.

Ottawa.—William Bros. have the plumbing contract and the Pease Foundry Co. the heating contract on 5 residences, \$5,000 each, being erected on Renfrew Ave. by Cowie & Moore, 414 Sunnyside Ave.

Toronto.—The plumbing contract on two stores and apartments, \$12,000 each, being built on the north side of Gerrard East., near Highland Ave., has been awarded to J. C. Clayton, 176 Malvern Ave., and the heating contract to T. Eaton Co.

Toronto.—Wm. Pugh, Don Mills Road, is the owner and builder of 4 residences, \$4,000, Dawes Road and Coleman Ave. The plumbing and heating contracts have been awarded to A. Lyford, 11 Wiley Ave., and J. T. Bowes, 1276 Danforth Ave.

Toronto.—R. J. Ritchie, 851 Logan Ave., has been awarded the plumbing contract and Mason & Allen the heating contract on three pair of residences, \$6,000 a pair, being erected on the west side of Woodfield Road near Applegrove. The same contractors have the work on a pair of residences, \$4,500 each, on Woodfield Road near Queen East.

Toronto.—J. Fraser, 802 Danforth Ave., has the plumbing contract for two pair of residences being built at \$7,000 a pair on Jones Ave. by Geo. Lankin, 43 Thornecliffe Ave.

Toronto.—The contract for heating and plumbing in connection with \$9,500 duplex residence at 742 Coxwell Ave., has been awarded to Geo. Copperthwaite, 118 Langford Ave. He also has heating and plumbing contracts on \$9,000 duplex at 744 Coxwell Ave.

Toronto.—W. Adams, 103 East Lynn, has the plumbing contract and Pollitt & Dilks, 16 Cedarvale Ave., the heating contract on two pair of residences, \$7,000 each, on Coxwell, below Danforth.

Toronto.—W. J. Merrill, 866 Kingston Road, has the heating contract and W. Adams, 103 East Lynn, the plumbing contract in connection with a pair of residences, \$7,500 each, on west side of Coxwell, below Danforth.

Vancouver.—W. A. Brown, Ltd., have the plumbing contract on \$550,000 apartment block, Georgia and Hornby Sts.

Westmount, P. Q.—M. Archambault, 1921 St. Catherine St., has the roofing and heating contracts on \$10,000 residence being built on Delorimier Ave. for Dr. Choquette, 1063 Delorimier Ave.

Ottawa.—The Garth Co. have the plumbing and heating contracts on the

\$60,000 addition to L. N. Paulin's store, O'Connor St.

Montreal.—O. Caron, 464 LaSalle, Maisonneuve, has been awarded the plumbing and heating contract for presbytery to be built at Dorion St.

Ottawa.—The heating and plumbing work on the \$18,000 addition to Murray St. school has been awarded to Gauthier & Co.

Sydney, N. S.—Hagen & Co., 542 George St., have been awarded the contracts for the heating and plumbing in the \$35,000 community hall being built for the Methodist and Presbyterian churches.

Timmins, Ont.—A. Brazeau has been awarded the plumbing, heating and ventilating contracts on the new \$80,000 high school here.

Ridgeway, Ont.—John W. Danforth, Ellicott Square, Buffalo, N. Y., has been awarded the plumbing and heating contracts on the \$67,000 club house for the Cherry Hill Club.

Simcoe, Ont.—Davidson & McInnis, Woodstock, have the sheet metal, heating and plumbing contracts on the \$25,000 addition to the plant of the City Dairy Co.

Toronto.—W. H. Booth, 365 Dovercourt Road, has the plumbing contract and Joseph Harrison, Toronto, the heating contract on the \$30,000 addition to manufacturing plant at 26 Noble St.

Windsor.—J. S. Seiber, London St., has the plumbing and heating contracts for three stores being built on Oulette Ave., at a cost of \$12,000 for A. Little, Pitt St.

Hamilton.—A. E. Fletcher, 267 Prospect St., has the plumbing and heating contracts for two residences costing \$10,000, Ottawa and Maple Aves.

London.—E. G. DePatie has the plumbing and heating contracts on \$15,000 stores and apartments being built at Wharnccliffe Road and Elmwood Ave.

Montreal.—J. A. Vaillancourt, 1301 St. Denis, has the roofing and plumbing contracts on \$12,000 residence near 1062 St. Denis.

Ottawa.—The heating and plumbing contracts for \$17,000 apartments being built at Clarence and Cobourg Sts. have been awarded to M. Archambault, Hull, P. Q.

St. Lambert, P. Q.—R. J. Williams, 13 Prince Arthur St., has the contract for plumbing and heating in connection with \$8,800 residence being built on Pine St. for Modern Housing Co.

Sandwich, Ont.—J. Seiber, London St., Windsor, has the plumbing and heating contract for \$12,000 residence being built on Partington Ave. for F. Prince, Windsor, also on \$14,000 duplex being built on same street for same owner.

Sydney, N. S.—Hagen & Co., 452 George St., have the plumbing and heating contract on \$12,000 residence being built on Kingston Road for M. A. Doak.

Montreal.—W. G. Bailey, 145 Bleury St., has the plumbing and heating contracts for \$20,000 residence on Courte, between Fort and Chomedey Sts.

Tenders Wanted

Almaville, P. Q.—Plumbing and heating tenders are being received by Jules Caron, architect, 21 St. Joseph St., Three Rivers, P. Q., on \$60,000 R. C. church being built here.

Tillsonburg, Ont.—Tillson Co. are open for suggestions and prices in connection with a \$15,000 steam heating system to be installed this fall. Plans and specifications with E. V. Tillson, Tillsonburg.

Montreal.—Plumbing, heating and roofing contracts are still to be let on \$25,000 store on Park Ave., near Bernard; F. H. Byrne, 2438 Park Ave., owner and general contractor.

Windsor.—Plumbing and heating contracts are still open on \$30,000 manufacturing plant to be erected on McDougal Ave. W. H. Willmot, 1044 Pelissier St., has the general contract.

Ottawa.—Tenders are being received by the owner, Wm. Joynt, Laurentian View, near Ottawa, on heating and plumbing for \$25,000 apartment house to be built at Wellington and Holland Aves.

Montreal.—Roofing, plumbing and heating contracts are still to be let on the \$18,000 garage being built by Senecal & Theoret, 288 Boyer.

Toronto.—Tenders are being received by the Toronto Carpet Mfg. Co., 1179 King St. W., on roofing, plumbing and tinsmithing for new dye house and manufacturing building.

Brantford, Ont.—W. A. T. Shorman, c/o British American Oil Co., is receiving tenders for the heating of the \$15,000 warehouse, office and garage being built by that firm on Burford Rd.

Montreal.—Roofing, plumbing and heating contracts are still to be let on the \$18,000 addition to garage by N. Fortier at 3099 Notre Dame E.

Regina.—The plumbing and heating contracts for \$13,000 addition to store on Tenth St. for Fuhrman & Co. are still to be let.

Vancouver.—J. V. & G. E. Lighthouse, Point Grey, B. C., are the owners and builders of \$50,000 apartment block, Spruce St. and 10th Ave. Roofing,

Mount Royal, P. Q.—Bremner Norris & Co. 65 McGill College Ave., have the general contract for four residences costing \$32,000 for the Model City Housing Co., Montreal. Roofing, plumbing, heating and tiling contracts still to be let.

Montreal.—A. K. Hutchinson, 10 Cathcart St., has the general contract for \$15,000 repairs to residence of A. Colville, 595 Pine Ave. Roofing, plumbing and heating contracts are still to be let.

Obituary

St. Lazare de Vaudreuil, P. Q.—Leon Lauzon, who had conducted a tinsmithing business here for a number of years, passed away recently.

THE MELTING POT

The traveling salesman had four minutes in which to catch his train.

"Can't you go faster than this?" he asked the street car conductor.

"Yes," the bell ringer answered, "but I have to stay with my car."

"To what do you attribute your long life, Uncle Mose?" asked a newspaper interviewer of a colored centenarian.

"Becuz Ah was bo'n a long time back," the old gentleman replied.

Gratitude is knowing how to pay a kindness in more than one way. A hungry and cold wanderlust of the road was fed and warmed in a minister's kitchen. When he rose to go, he said, "Parson, I can't give you any money, but I know how to fix your gas meter so it won't register."

Just before the conclusion of the weekly prayer meeting in a country town one evening the parson arose and glanced over the congregation.

"Is there anybody present," said he, "who wishes the prayers of the congregation for a relative or friend?"

"Yes, parson," answered a tall, angular woman rising to her feet. "I want the congregation to pray for my husband."

"Why, Sister Martha," exclaimed the parson with a surprised expression, "you have no husband!"

"I know I haven't," was the calm rejoinder of Sister Martha, "I want all hands to pitch in and help me pray for one."

"When I was ship-wrecked on the coast of South Ameriky," said the old sea captain. "We came across a race of wild women who had no tongues."

"Good gracious! How did they manage to talk?"

"They couldn't. That's what made 'em wild."

Visitor—"There's no soup on the menu."
Waiter—"No, sir; I just dried it off."

Perfectly well meaning old lady: "Thank you so much for your song, my dear. It took me back to my childhood days on my father's farm and when I shut my eyes and listened to your singing I seemed to hear the dear old gate creaking in the wind."

One day in a club on Cordova St., Vancouver, two old lumberjacks, after many years' separation, were about to crook their elbows, when one remarked to the other: "Yust you work at Rock Bay?"

"I yust. Yust you?"

"I yust. I thought you yust."

ONE ON A POLICEMAN

The witness had just been severely reprimanded by the court for having called the officer a jackass.

"You mean to say that it is a misdemeanor to call a policeman a jackass?" asked the witness.

"It certainly it," was the answer.

"Is it any harm to call a jackass a policeman?" queried the witness again.

"None whatever," smiled the judge.

As the witness left, he turned and said to the policeman: "Good-bye, policeman!"

The Boomerang Always Returns

Sanitary Engineers' Social Club is Organized in Hamilton

Inaugural Meeting of New Organization of Hamilton Plumbers Designed to Further Educational and Social Intercourse—C. F. Rogers is Elected President

AT A largely attended meeting of the Craft of Hamilton and vicinity there was launched a unique organization to be known as the Sanitary Engineers' Social Club.

During last winter the Hamilton Craft, without any particular organization, carried out a series of evening dinners, the wonderful success of which has already been described in Sanitary Engineer.

This year, it was decided to elaborate somewhat the original plans, and for this purpose it was thought best to form some regular organization to carry on this work. A most representative meeting was held when all branches of the trade including manufacturers, jobbers, masters and journeymen were present.

After an excellent dinner, interspersed with musical selections, in the Arcade Dining Room, Hamilton, the meeting was called to order by Gordon Stewart, president of the Ontario Society D. S. & H. E., acting chairman. After he and Mr. Charles F. Rogers, Hamilton manager of the Standard Sanitary Mfg. Co., had briefly outlined what had been accomplished last year and what they hoped to see carried out this winter, the regular organization of the Sanitary Engineers' Social Club was enthusiastically decided on.

The following officers were elected:

President—Charles F. Rogers.

Vice-President—Walter Brittain.

Secretary—Frank Lang.

Treasurer—William Malloy.

Executive Committee: W. A. Canning, Edwin Parkyn, F. R. MacDonald, Jas. Harrower, Stewart Clark.

and one member whom Local Union No. 67 Journeymen, were asked to appoint to represent them. Mr. Hal Rogers was unanimously elected Chairman of the Entertainment Committee.

It was decided to centre all of the various activities of the trade in Hamilton, in the club, and strong committees were appointed to organize bowling and baseball leagues.

Following this, the president-elect outlined a few of the good things he has already planned for a series of ten dinners this winter, which include talks from some very well known manufacturers, financial men, and others. Mr. Rogers expects to announce the complete programme shortly.

After the business of the meeting had been completed, Major L. L. Anthes, president of the Anthes Foundry Co., Toronto, and also president of the Toronto club, recently organized along similar lines, gave a brief but interesting and helpful talk on the value of co-operation. Major Anthes was accompanied by quite a delegation from the Toronto Club, including Roy Belyea, Harry Weinraub, H. W. Rushby,

K. B. Allison, Capt. Wotherspoon, John Birchard, Hugh Wallace and others, including representatives of the trade press.

The Hamilton Craft are certainly to be congratulated on the very live organization they have. A very fine spirit of camaraderie prevailed as was plainly shown by one little incident. It was brought to the attention of the meeting that a fellow craftsman, W. A. Owens, of Jarvis, had recently met with a very severe accident, while engaged at his work, which would confine him to his home for many weeks.

S. E. S. DINNER SCHEDULE

The Sanitary Engineers' Social Club of Hamilton, the account of whose first gathering of the season will be found elsewhere on this page, have arranged an interesting program of dinner meetings for the coming months, to which they are extending a cordial invitation to anyone connected with the plumbing industry. The dates of the dinners, which are held in the Arcade Dining Hall from 6.15 to 8 p.m., are as follows:—November 7, November 21, December 5, December 19, January 16, February 13, March 12, March 26, April 9, April 23.

C. F. ROGERS

Hamilton manager, Standard Sanitary Mfg. Co., who was elected President of the Sanitary Engineers' Social Club of that city for the season.

He had some partly completed contracts, furnace installations, etc., which were worrying him.

Before the meeting was over, it was arranged that this work would be all taken care of for Mr. Owens.

It is hoped and fully expected that this Sanitary Engineer Club idea will spread.

Issue Sanitation Bulletin

Moose Jaw, Sask.—The Hon. J. M. Uhrich, Minister of Public Health, has drawn attention to the Sanitations bulletin recently issued by R. H. Murray, Provincial Director of Sanitation, in which much good advice is given to those living in rural districts, who have modern plumbing installations in their home, connected with a private sewage disposal system in the vicinity of the house. The advice deals with proper care of the systems in the fall.

Investigate Central Heating Plants

Ottawa.—Hon. Charles Stewart, Minister of the Interior and Mines, has announced that F. A. Combe, Montreal steam and combustion engineer, has been engaged to make an exhaustive report on the feasibility of establishing central heating plants in Canada. This is in accordance with the policy of the Dominion Government to devote its efforts to a permanent solution of the fuel problem.

Appoint Water Superintendent

New Westminster, B. C.—The City Council has appointed F. H. Hardman as water superintendent, the appointment being made temporary, permanent appointment depending upon the successful administration of the department.

Unusual Activity Noted in Kingston During Present Fall

KINGSTON, Ont.—There is unusual activity in the plumbing and heating business. While the large firms have been pretty well occupied all summer, the approach of winter has caused a rush of orders and every available plumber is busy. The manufacturers of hot water radiators are reported to be behind their output and local demands cannot be filled promptly. The annual overhauling and renewal of heating systems is the cause of the unusual activity at the present time, rather than an increase in building during the summer.

Will Erect New Plant

Owen Sound, Ont.—Following the visit to this city of the divisional manager of the Canadian Oil Co., it was learned that anticipated improvements to the local plant would not be made, it now being the company's intention to erect a new plant here, beginning construction early next spring.

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

THE new Sales Tax regulations, which have been announced, and the particulars of which appear in this issue, in which it is mentioned that the Sales Tax is not to be shown separately on the invoice, will likely bring forth many price changes between now and the end of the year. All lines of stoves, stove repairs, and heating goods are undergoing active sale in various centres; these lines are moving noticeably better with the advent of colder and more seasonable weather, than was the case during the warmer fall days prior to two weeks ago. Considerable price cutting is in evi-

dence at the present time on nearly all lines of iron and steel sheets as well as on steel and iron bars, flats and shapes. Substantial cuts under regular prices are quoted on many of these lines, upon the appearance of orders of any appreciable size. Pig iron still continues to weaken, and the price has been reduced to \$30.30 per ton. Low prices on this metal have enabled it to compete with American iron in Michigan almost as far west as Chicago. Lead ingots are stronger and copper ingots have continued to weaken in basic markets.

Montreal Markets

MONTREAL, Oct. 30.—Local dealers and jobbers report that business has been very active during the past week in all seasonable lines, with a noticeable activity in all lines of heating equipment.

Higher prices are now effective on galvanized sheets and dealers are of the opinion that still higher prices will be seen. Black sheets are slightly easier this week. The scrap materials market is reported by dealers to be very quiet with prices at extremely low levels.

The ingot metal market is somewhat irregular in tone this week, the chief feature being the strength of lead and the continued weakness in copper. Other metals show little change since last week.

ENAMELED WARE SELLING IN GOOD VOLUME

Montreal.

Prices are steady on enameled ware following the recent decline. Sales in this line are reported to be of quite a satisfactory nature at the present time. Current prices are given herewith:

ENAMELLED WARE—

Sinks, flat rim—	1 only	2 only	3 only
16 x 24	\$ 7 50	\$ 7 40	\$ 7 30
18 x 30	8 70	8 60	8 50
20 x 30	9 90	9 80	9 70

Copper Imports From Britain Rapidly Increasing

THE United Kingdom has made good progress during the past two years in increasing their exports of manufactured and partially manufactured products of copper to Canada. The rate of increase noted in connection with these imports of copper products from Britain, as compared with those of the United States, shows the United Kingdom to be gaining ground to a remarkable degree.

Two or three years ago, very little material of this kind was shipped into Canada from England, any importing of these products being done from the United States.

British manufacturers have, however, worked into this market and are rapidly coming to the top, according to the reports of the Dominion Bureau of Statistics.

For four months ending July in 1921, 40,360 cwt. of copper bars and rods were imported by telephone wire and cable companies as against 123,002

cwt. for the corresponding months in 1923.

The imports of copper strip, sheets and plates for four months of 1921 ending July, were 15 cwt., and for the same period in 1923 they were 3,117 cwt.; on these goods, and for the same periods, the imports from the United States were in 1921, 99,163 cwt., and in 1923 they were 125,266 cwt.

These figures will show that while the imports from the United States increased 25 per cent., the increase in proportion from the United Kingdom was much more.

The total imports on all kinds of copper products from Britain for four months ending July, in 1921, were 17,042 cwt., as against 121,968 cwt. in 1923, showing an increase in the two years of over 700 per cent., while the imports from the United States on all lines of copper for this period of 1921 were 951,575 cwt. as against 3,195,716 cwt., showing an increase of about 330 per cent.

COMPRESSION GOODS SELLING WELL AT PRESENT

Montreal.

Solder wire, lb.	0 39
Zinc sheets, casks	0 11
Do., broken lots	0 12

SCRAP MATERIALS SELLING VERY SLOWLY

Montreal.

Dealers in scrap materials report that the market is very quiet at present and little business is being done in any line. Prices on yellow brass, red brass, and light copper are slightly lower. Average buying prices are as follows:

SCRAP—

Automobile Tires	0 50
Rubber Shoes	0 02
Yellow brass	0 06
Red brass	0 08
Light brass	0 04 1/2
Scrap zinc	0 05
Lead, heavy	0 05
Lead, tea	0 03
Light copper	0 09
Heavy copper	0 11 1/2
Wrought iron, R. Rd. No. 1 per gr. ton	14 00
Malleable scrap (ton)	16 00
Pipe scrap (ton)	8 50
Heavy melting steel	9 50
No. 2 busheling	5 00
Boiler plate	12 00
No. 1 machinery cast	20 00

STRENGTH OF LEAD FEATURE OF METAL MARKET

Montreal.

The metal market is irregular in tone this week, the chief feature being the strength of lead and the continued weakness in copper. Other metals show little change since last week.

TIN.—This metal continues to hover around the £200 mark, and any attempts to knock prices down are promptly met by buying support in London. The situation appears to be a test of whether London can maintain prices until American consumers are forced to come into the market. At present there is little buying interest on the part of the U.S. A. The local market is steady at 48 cents per pound.

COPPER.—This metal is again slightly lower and evidently the bottom

is hardly yet in sight. Production has been curtailed very little as yet, and with consumption continuing to fall off, the statistical position does not improve. The low-cost mines are evidently determined to force matters to an issue, as they are still able to make a profit at present prices. Export demand is dull and the situation is not very cheerful from the point of view of producers. The local market is easy at 18 1/2 cents for electro and 18 cents for casting.

LEAD.—This metal has been in the spotlight this week owing to the sharp advances in London, and as prices here are based on the English market, they have advanced accordingly. There is evidently a temporary shortage and prices have been advanced as a result, but it would seem as though present levels are too high to last long. The local market is strong at 18 3/4 cents per pound.

ZINC.—Last week's advance, both in London and the U.S.A., was not of a permanent nature and prices have reacted to some extent. This is possibly only temporary, as zinc is in a fairly good position and at present levels does not show any profit to producers. The immediate future is somewhat obscure but there is not likely to be much change. The local market is steady at 9 1/4 cents per pound.

ANTIMONY.—There has been somewhat of a firm tone to the market this week, and as offerings from China are still rather scarce, there has been a slight premium paid for nearby lots. This has hardly affected prices here as the demand is light and the market quiet at 8 1/2 cents for English and 8 cents for Chinese.

Toronto Markets

TORONTO, Oct. 30.—The colder and more seasonable weather which is being experienced at the present time, has had quite a stimulating effect on all lines of heating and stove repair business of late, in local centres. Jobbers and dealers in plumbing and heating lines report that quite a seasonable amount of work has been done during the past two weeks, and that the volume of trade has been greater than that obtained during the milder weather which has been experienced this fall. There has been a decline in the price of some lines of Quatern brass goods. Pure copper and brass wire has declined, as also have soldering coppers. Pig iron prices are lower by \$1 per ton than they were two weeks ago, the present price for ordinary quantities being \$30.30 per ton. Candlewick has advanced in price to 69 cents per pound. Ingot lead and tin have both undergone an advance in price on a strong market while, on the other hand, copper still continues to weaken though local prices are unchanged.

DECLINE NOTED IN SOLDERING COPPER PRICES

Toronto.

Soldering coppers have declined in price to the extent of about three cents per pound. This decline is due to the weakness noticeable in connection with the copper market lately. The prices are: 4 to 8 lbs., per pair, 39 cents per lb.; 3 lbs., per pair, 40 cents per lb.; 2 1/2 lbs., per pair, 41 1/2 cents per lb.; 2 lbs., per

pair, 42 1/2 cents per lb.; 1 1/2 lbs., per pair, 46 1/2 cents per lb.; 1 lb. 50 1/2 cents per lb.

COTTON CANDLE WICK ADVANCES TO 69 CENTS

Toronto.

The price of cotton candle wick which has been 67 cents per lb. has advanced with all other lines of cotton goods and is now selling at 69 cents per lb.

Most men prefer shower-baths.
Give them what they want, and
make them happy!

The New MUELLER Tub Shower Faucet

gives every plumber something to sell those who already have bath-rooms, as well as to those installing them.

It combines the features of the ordinary bath cock with the advantages of the modern shower-bath. The five-foot hose is permanently attached to the cock. Hot, cold or tempered water can be drawn either from spout or spray, as needed.

It will pay you to install A-2395 on a sample tub and display it in your show window and in your shop. It sells on sight and nets you a handsome profit.

PURE COPPER AND BRASS WIRE PRICES DECLINE

Toronto.

During the past two weeks two separate declines have taken place in the prices on pure copper and pure brass wire.

The first decline amounted to ½ cent per lb. on both the brass and the copper. The last decline amounted to 1 cent per lb. on pure brass wire and ½ cent per lb. on pure copper wire.

The base price on the brass is at present \$29.34 per cwt., and the base price on the copper is \$23.34 per cwt.

SOME BRASS GOODS PRICES REDUCED

Toronto

Some Quatern brass goods lines are lower in price than formerly quoted. Top china handle bath cock, No. A3200 which used to sell at \$4.98, now sells at \$4.75. Side china handle bath cock No. A3500, which used to sell at \$5.45, now

Production of English Sheets is Now at High Level

ENGLISH galvanized steel sheet mills are at the present time very busy. All mills are producing material in large volumes, and in this industry, unemployment is almost unheard of now. The condition in the Ruhr which exists at the present time, with many of the mills closed down and with the restriction of output in effect on those that are still running, as well as the difficulties in connection with exporting, without a doubt, is putting a lot of additional business in these lines through British mills, which probably would be placed through other sources of supply, under normal circumstances.

In England at the present time, keen competition exists in connection with orders from Japan and other Oriental countries. Great quantities of galvanized steel sheets are being shipped to the devastated areas of Japan for roofing and other purposes, where rapid construction is necessary.

With reference to the recent charges that poor quality galvanized sheets were being placed on the market from English mills, Sanitary Engineer has made inquiries regarding this matter, and it has been ascertained that while it is true that such imports were made into Canada, these sheets were represented as not first quality material, and were sold as such, at lower levels than regular first quality material.

Ordinarily, at this time of the year, Canadian importers of galvanized sheets have full warehouses, as advantage is taken of the cheaper freight rates prior to the close of navigation to Montreal, but owing to no settlement of the sales tax question having as yet been made, and as this is an important feature with importers of these lines, stocking up has been delayed until this question is settled definitely, when importers will know on what basis their costs are to be figured for the coming year.

sells at \$5.15. Quatern basin cocks, side china handle, No. A2000, which used to sell at \$5.20 per pair now sell at \$5 per pair. Quatern basin cocks, top china handle, No. A1900, which used to sell at \$4.28 per pair, now sell at \$3.80 per pair. All other lines of brass goods are selling at prices formerly published.

PRICES ON COMPRESSION GOODS FIRMLY MAINTAINED

Toronto.

No change has been made in the prices of compression goods, levels already in effect being maintained firmly.

Sales are reported to be good in these lines, both by jobbers and by dealers.

PIG IRON PRICES STILL ARE WEAKENING

Toronto.

No signs of strength are yet noticeable in pig iron sales, a further weakening taking place in prices during the past two weeks.

Pig iron, which has been selling for some time at \$31.30 per ton in ordinary quantities, is now being quoted \$1 cheaper at \$30.30 per ton.

Very little local demand is noticed for this metal at present, notwithstanding the very low prices which are being

NEW KING WATER BOILERS

The Solution to All Home Heating Problems

The wise plumber knows that King Boilers can change the bleakest and chilliest of homes to havens of cozy, cheery comfort; that King Boiler Heating systems can be installed so quickly and with so little inconvenience that house routine is not disturbed. He knows, too, that the quick installation brings him larger profits.

Intensive work on your part now will bring sure, certain results. Emphasize the proven economy, the exclusive heating features, the moderate cost and the fine investment value of King Boilers. Sell more than a furnace—sell years of **genuine heating comfort**.

Imperial Radiators are fine running mates to King Boilers. They insure a perfect heating system.

A line to us brings a catalogue.

Canadian Iron Competing for Michigan Trade

CANADIAN iron is increasingly prominent. It is in active competition with United States furnaces in Michigan and has been sold not far distant from Chicago.

Iron Age says: Some expansion in automobile manufacture, sustained structural steel activity and, for Japan, buying and definite inquiries stand out in an otherwise featureless steel market. In pig iron the story is one of scattered sales at prices 50 cents and \$1 below those of a week ago.

In bookings of finished steel the rate so far in October approaches 10 per cent. better than for the same period in September. Mills devoted to one or two products have not done nearly so well, orders with some plate makers not exceeding 30 per cent. of capacity.

An improved scale of buying appears to wait on a flow of railroad equipment inquiries, which are expected to gather

in volume in December. Meanwhile, necessity purchasing describes the present and immediate outlook. Taking 60 to 65 per cent. of capacity, new orders and specifications on contracts are neither large enough to indicate that price cutting would bring an increase nor small enough to allow buyers to cease watchfulness for the upward turn.

Hope of pig iron sellers of being able to stop the downward trend of prices has rested on decrease of production and a number of merchant furnaces have either been blown out or will soon be put on the idle list. Whether this curtailment of operations will proceed rapidly enough to stop further price declines is not certain. Only five merchant stacks are now in blast in the Pittsburgh and Valley districts. Price recessions continue. At Pittsburgh, basic and foundry grades have been marked down \$1, while prices in nearly all other centres have been reduced from 50 cents to \$1.

quoted now. Canadian prices are so low now that some Canadian pig iron is competing with American iron in Michigan, nearly as far west as Chicago. This situation is without a doubt an extraordinary one, as very little pig iron from Canada finds its way into U. S. so far west.

PIG IRON—(Price per ton)—
In ordinary quantities 30 30

ENAMELED WARE SELLING IN GOOD QUANTITIES

Toronto.

Good quantities of enameled ware are passing through jobbing houses to dealers.

Most plumbing houses are having a fairly busy season as far as the installation of enamel ware fixtures is concerned.

Current prices are given herewith:

ENAMELED WARE—

Sinks, flat rim—	1 only	2 only	3 only
16 x 24	\$ 7 50	\$ 7 40	\$ 7 30

17x19 in. Roll rim. F241 or P4345.....			12 60
Less 30 per cent.			

INGOT METAL PRICES ARE UNCHANGED; COPPER WEAK

Toronto.

Ingot copper prices are still unchanged locally notwithstanding the declines which have taken place in basic markets.

Lead prices have advanced slightly locally. Prices now range from \$8.25 to \$8.50 per 100 lbs. instead of from \$8 to \$8.25, as formerly quoted.

Ready sales are noted in ingot lead. Other metals are unchanged and prices are steady both locally and in primary

markets, with the exception of slightly stiffer prices on tin. the current quotation being \$46. Prices are as follows:

INGOT METALS—

Copper, \$18.00 to \$19.00; Tin, \$46.00; Lead, \$8.25 to \$8.50; Spelter, \$9.00; Antimony, \$8.25 to \$8.50; Aluminum, \$23.00 to 25.00.

TRADING IN PIPE FITTINGS FAIRLY ACTIVE

Toronto.

Trading during the past two weeks has been fairly active. Dealers report that a seasonable amount of work is being done which calls for a fair quantity of both cast iron and malleable pipe fittings.

Discounts in effect at the present time are given herewith:

Do., do., less, lb.	0 12¼ 0 13½

WHAT IS A MAN?

WHAT is a man? Is he just bone and muscle, so much beef to be used for the strength that is in him, or is there something in his make-up of vastly greater value than mere brute strength? The Almighty endowed us all most abundantly for the battle of life. If we do not use our endowments to the fullest, we have no one to blame but ourselves for our lack of success. If, however, we make no attempt to develop endowments in others, we are neglecting both a privilege and a duty.

CONTRACT AWARDED

HAMILTON.—The plumbing contract on the \$100,000 sub-station at Ottawa and Beach Roads, for the Hamilton Hydro Commission, has been awarded to the Robt. Fitzsimmons Co., Hamilton.

Winnipeg.

WINNIPEG, Oct. 30.—With the advent of the more seasonable cold weather, there has been a considerable stimulation in heating lines, both in sales of stoves and heaters, and also in installations of steam and hot water equipment. There is little change to report in the plumbing and steamfitting lines. With the approach of colder weather sales have dropped off and business is reported quieter. There is a revision in discount on radiator fittings such as valves and elbows.

REVISION IN DISCOUNT ON VALVES AND ELBOWS

Winnipeg.

Revised prices are in effect on radiator fittings such as valves and elbows. Radiator valves are quoted at list price less 55% and elbows show the same discount.

SOIL PIPE PRICES AT FORMER LEVELS

Winnipeg.

Soil pipe prices are fully maintained by dealers. Sales are dropping off with the approach of cold weather.

LEAD AND ZINC GOODS STEADY IN PRICE

Winnipeg.

Lead and zinc goods prices remain steady. Business is rather quiet in these lines at present. Lead prices on primary markets are showing a firmer tone. The zinc market is slightly easier.

SALES IN CORRUGATED SHEETS SEASONABLE

Winnipeg.

Dealers in corrugated sheets state that sales for this line are seasonable. Prices are steady and show no change.

DEMAND FOR CLOSET GOODS LIGHT

Winnipeg.

Dealers report that the demand for closet combinations, seats, tanks, etc., is quiet at the present time. Prices are well maintained.

BOILER STANDS REMAIN FIRM AT OLD LEVELS

Winnipeg.

Range boiler stands continue firm in price at levels established some months ago. Sales, while not heavy, have been seasonable and quotations remain unchanged.

NO CHANGE IN EAVESTROUGH AND CONDUCTOR PIPE

Winnipeg.

With the approach of colder weather, the demand for eavestrough and conductor pipe has fallen off slightly. Quotations show no change.

STOVE PIPE DAMPERS SELLING WELL

Winnipeg.

There has been a heavy demand for stove pipe dampers and sales have been fairly heavy during the past few weeks.

Baldwin Canadian Plant Likely to Re-open Early Next Spring at Capacity

TORONTO.—There is a strong possibility that the Baldwin Canadian Steel Corporation, a subsidiary company of the British Baldwin Company, of which the present British premier is the head, will re-open their plant at Ashbridge's Bay early next year. Directors of the parent firm are expected to visit Canada shortly to consider the whole situation.

It is stated on good authority that if operations are commenced, the plant will be run at capacity, employing in the neighborhood of 600 men, as it is stated that it would be uneconomical to operate on a reduced basis.

Enquiries have already been made in the United States in three different quarters for prices on sheet bars for delivery in the first quarter of 1924, it being pointed out that the Welsh market is not in a position to compete as to continuity of supply at the present time, particularly as the shipments could not stand the freight rate from St. John in winter. A certain quantity of materials

may be purchased from the Steel Co. of Canada, this being one of the companies of whom quotation enquiries on sheet bars have been made.

MUCH INTERESTED IN MERGER

Peterborough, Ont.—Much interest is manifest locally in the announcement that the Canadian General Electric Co. is likely to pass into the hands of the General Electric Co. of the United States. One of the largest plants of the company, employing 2,000 hands, is located in this city. It is felt here that the absorption of the Canadian company will result in the concentration at one place of many of the plants now scattered throughout the country, and will also result in larger development in the Canadian electrical manufacturing field.

MANAGER SEVERS CONNECTION

Owen Sound, Ont.—George H. Douglass, manager of the Northern Bolt, Screw & Wire Co., has resigned to accept a position in Windsor. Prior to his leaving, a presentation from the office staff and foremen of the different departments of the plant was made by General Manager Fraser.

They'll Give Service— JENKINS Radiator Valves

are far superior to the ordinary run of radiator valves.

Made of a superior grade of bronze they are much heavier and stronger. They are true Jenkins Valves in design, material and workmanship.

They assure long and satisfactory service even where the conditions of usage are extra severe.

Supplied with either male union or with screwed ends as desired. Regularly furnished with rough body, nickel plated all over.

Catalog No. 9—free on request—describes them and the other Jenkins Valves in detail.

Write for your copy to-day.

FACTORIES: Montreal, Bridgeport, Elizabeth.

Half a cent. per joint, the average cost of the cheapest pipe-joint compound you can use.

This half a cent is the extra cost of leak-proof joints made with Smooth-On No. 3.

Isn't it worth the other half cent to make this joint tight for all time

LOOK to the future! What's half a cent one way or the other compared with labor and material costs in re-making a screw-thread joint?

That extra half cent covering the use of Smooth-On is the turning point between perfect service and no end of nuisance in the after years.

As long as a Smooth-On joint stays in the line, it **stays tight** because the iron body in the Smooth-On can't dry out, shrivel or shrink—yet the joint can be unscrewed if changes in the lines become necessary.

Smooth-On Satisfaction can't be explained—it must be experienced.

Try the free sample (see coupon) and you will want more for every new screw-thread joint you make. Use it also for painting gaskets, pressure seams, etc., and thickened with Smooth-On No. 1 to make boiler patches.

Smooth-On No. 3 comes ready to use, in 1-lb., 5-lb., and 10-lb. gray-labeled cans. If your dealer is out of stock, send us his name so we can see that you are supplied.

Send for a free copy of Smooth-On Instruction Book

This 144-page book of simple directions and diagrams will post you well on Smooth-On, where to use each grade, how to apply for best results and what to expect. Sent free if you mail the coupon.

a minimum of cost and inconvenience.

Dunham Packless Radiator Valves With Wheel-Type Handle and Interchangeable Parts

This is constructed with built up bellows just like the Dunham-Lever Handle Valve and can be fully opened or closed with approximately one turn of the handle. It is particularly popular with heating contractors because of its effectiveness on steam or hot water type radiators and its convenience for either top or bottom connection. Sturdy, good looking and absolutely leak proof.

What kind of a water heater does your customer need?

YOUR customer wants a water heater. And to him it is just a water heater. He has no particular type or kind in mind. He knows that his present system of water heating is inadequate. He will probably buy an automatic or a storage of any size that you recommend.

But which type, which size heater will be the *best for him*?

There are eighteen Pittsburgs in the complete Pittsburg line. There is one for every one of your customers whether he wants to supply hot water to one bathroom or a dozen. And that heater will give him his hot water *at the cheapest possible rate per gallon*.

It pays to handle the complete line. You have a satisfied customer. You have installed a heater that is right for the job. There are no service charges to eat into your profit.

Write to-day for complete details.

The Marvel

Heater and Tank Combined

Can't Wear Out, Burn Out, nor Rust Out

THE Marvel is free from coils, disks, or other parts that ordinarily wear out, burn out, rust out or break. Because of the constant circulation of the water it will not lime up nor become clogged.

The Marvel—compact, simple, low-priced and efficient—will give your customers long years of smooth service.

Entirely different both in heating principle and in design, the Marvel offers more and better service for a fraction of the cost of an old-style heater.

*Write to-day for full particulars
Sold only through or by plumbers*

BASTIAN-MORLEY LIMITED

125 Hanson St., TORONTO

Don't say "No"

Say "yes" to the man who asks you whether you can install a septic tank for him before winter.

Stop thinking in terms of concrete, bricks, and mortar—the Griffith All Metal Septic Tank, complete, ready for installation, has sent the old style expensive model to the discard.

No waiting for concrete to set, no depending on bricklayers, no delays when you install a Griffith. Get busy to-day on those jobs that you would ordinarily put off till spring. With the Griffith Tank you can make installations right up to the last minute of fair weather.

“Emco” Bath Fittings Now Come Assembled

For the convenience of the plumbing trade “Emco” bath fittings now come assembled, packed in individual boxes.

You are assured of perfect fitting and that you will have all the parts required when you are ready to instal a bath. All the hunting up and fitting of odd parts has been eliminated. You just need to take down a box from your shelves and you are ready.

Think what this means to you in a year. It will save you hours of skilled laborers’ time.

And the quality of the fittings remains the same, highly polished, backed by the “Emco” guarantee, a handsome set for any bath.

Your jobber now has the “Emco” bath fittings in one individual box, or write us.

THE *Little Giant* PIPE WRENCH

Patented February 4th, 1913.

*Simpler
Stronger
Lasts
Longer*

**ONLY
THREE
PARTS**

Write for Circular

Here It Is!

The very wrench you have **needed**—but perhaps have yet to realize that need! For you to “feel” the **Little Giant** in your hand; use it on the “tough” jobs; get into the “tight” places with it to find out how much you have **needed** its light weight, extra strength and handiness on the job.

Just like a projection of the hand and arm to get into holes and corners—with a grip like a vise but takes hold and lets go as quickly and easily as pliers.

The **Little Giant** is made of the best drop-forged heat treated steel, correctly proportioned and with just three parts—all practically indestructible. Still it is lighter and easier to carry around than other wrenches are.

Note the different sets of teeth on the reinforced head. These increase the **Little Giant's** adaptability and double its useful life.

Ask your regular dealer for **Little Giant** Pipe Wrenches in sizes you wish. If he does not have them, write direct to us. Positively guaranteed. Order now.

“’Twas Ever Thus”

Busier than a one armed paper hanger, hardly time to eat or sleep but never enough money on hand to meet promptly the bills and drafts that flow in from all corners. It's the same old story, That MAD DESIRE for volume, anything to get a job away from the other fellow, with little thought of Overhead or Profit. No wonder 97% of the Sanitary Engineers in the Country fail to make a success of their business.

Here's the Trouble

There is entirely too much guesswork. Most of the trade guess at Overhead Expense, guess at Profits, guess at Quotations, guess they will come out all right. They have no definite businesslike policy of making their charges or tendering on jobs with the result that about 80% of the plumbing and heating work in Canada to-day is being done at cost or less.

The Solution

The plumbing and heating business is no different from any other business. The prices received for goods and services must be sufficient to cover Costs, Overhead Expense and Profits. But, the average Sanitary Engineer has neither the time nor the facilities for keeping an accurate up-to-date RESALE PRICE LIST on the 3000 items in every day use and the Henderson Business Service is an outgrowth of this condition.

We Guarantee Your Profits

No matter where you are located, whether your business be large or small we will undertake to guarantee you a profit on every article sold and every job installed. We are doing it for others and can do it for you and the cost of our service is the price of a cigar a day.

Removing the Coils

Ruud Tank Heater Coils are easily removed. No brazed joints—coils are attached to brass union manifolds outside of heater by ground joint coupling.

Installing the Ruud

Two unions, two pipe cuts and four pipe threadings are saved by the detachable union manifold construction of a Ruud.

Removing the Burner

The Ruud Tank Heater Burner is mounted on the machined end of a mixer inserted through the heater base. A slight turn disengages the mixer from burner. Both can be removed in a second.

RUUD TANK HEATERS

Save Installation and Maintenance Expense

THE time and labor saved on installation and maintenance make your Ruud Tank Heater business profitable.

The Ruud was designed and built with the dealer's problems in mind. The greater part of the installation work is done in our factory.

In operation the Ruud is quick and

efficient. No heavy castings inside the heater to impede quick heating. Coils are joined to union manifolds outside of the heater—nothing in the heat zone but copper coil heating surface.

Let the Ruud multiply your Tank Heater sales, subtract from your overhead expense—and add to your net profit.

Ask for prices and terms.

Together, We Can Solve Any Heating Problem

Pretty nearly every householder strikes a heating difficulty sooner or later, it seems to me. I so often receive letters, asking for solutions of heating problems. Like to get them, too. Especially the kind that test the elasticity of Gurney Heating Systems.

You must feel the same way about it, I suppose. And I imagine, too, that you get a lot of solid satisfaction out of your ability to "find the answer" by recommending and installing Gurney Heating throughout—boiler and radiators that guarantee satisfaction in each particular case.

Gurney economy and efficiency are an old story to you practical heating engi-

neers. But I wonder if you keep as fully posted as you might, concerning the elasticity of Gurney Heating Systems? That's a trump card, when comparisons are being made.

Let me suggest, right here, that you write me personally whenever you bump up against a hard heating problem. An exchange of ideas will do us both good. That's part of the Gurney Service that backs up Gurney Boilers and Radiators.

Yours for service.

Holt Gurney

Gurney

Wall Type

Gurney Furnaces for Steam, Hot Water and Warm Air
—Gurney Stoves for Electricity, Gas, Coal and Wood
are good products worthy of the Gurney name.

Gurney Wall-Type Radiators will often solve space-saving problems. The above border was used on a recent consumer advertisement that pointed out to the builders of a snug little home how they could have ample radiation surface with a Gurney System, and yet not cramp their rooms at all. That advertisement carried this message from you: "Have you a heating problem? Write us and we will gladly help you solve it, whether it is for an old house or new, for hot water, steam or hot air. Our steamfitters are at your service." We want you to get all possible benefit from our extensive advertising.

Gurney performances are positively known and the Gurney line is complete. There's no guess-work in recommending Gurney Heating for any purpose. Gurney installations do credit to Heating Engineers.

Daisy Boilers Viking Radiators

For sixty years Warden King engineers have striven to produce better heating boilers and radiators.

Feature by feature, year by year, Daisy Boilers and Viking Radiators have led the industry in newer and better construction; in refinements and improvements that to-day are summed up in our 1923 models—the finest and most economical heating units on the market.

Over 60,000 Canadian homes confidently rely on Warden King equipment for winter comfort. Let us send you a few typical testimonials.

Everybody wants a quiet closet

Nothing is more embarrassing in the home, and particularly with guests, than a noisy flushing closet. Even in the installation of a very modest toilet-room, the added refinement of a quiet closet is appreciated. And the desire is so easily gratified by furnishing the Quietus-Bellemeade combination illustrated. The moderate cost of this outfit should make it practicable for almost every household. The labor cost of installation is no greater than for a less desirable fixture.

The superiority of this closet combination exists in its being of syphon jet type, extremely quiet in operation, and possessing outstanding sanitary characteristics. Both closet and tank are made of SOLID VITREOUS ware, hard-burned, all-clay, vitreous through and through, proof against the absorption of dangerous acids, and with a clear white deep glaze surface, possessing no affinity for dirt or germs, as smooth and as easily kept clean as a china plate.

Progress in Standardization to Reduce Costs of Plumbing Business

Certain Sizes and Tappings Decided Upon in Connection With Standardization of Range Boilers, Pressure Tanks, etc.—Has Endorsement of Most Manufacturers—Change Method of Measuring Boilers

EDITOR'S NOTE:—At this time when the subject of costs is receiving so much attention standardization of equipment handled in the plumbing and heating industry becomes of much importance. Such standardization has done much to lower costs in many other industries through reducing the investment necessary to carry complete stocks. Some time ago standardization of laundry trays was reported. The latest action of the Simplification Bureau of the U. S. Dep't of Commerce is the standardization of range boiler sizes and tappings. This is outlined fully in the following:—

THE NEW standards of tappings and sizes for range boilers as adopted by manufacturers representing 90 per cent. of the total tonnage of range boilers, at a meeting arranged by the Simplification Bureau of the U. S. Dep't of Commerce are as follows:—

Tappings:—Standard tappings for all range boilers to be five (5) 1-in. tappings; two in top of boiler; two in side of boiler vertically over another, one of which shall be 6 in. from top of boiler and the other 6 in. from bottom of boiler; one tapping in bottom of boiler. Construction of range boilers with this style of tapping to begin at once and the universal use of this type of tapping to become effective not later than July 1, 1924.

Size of range boilers:—The following sizes were adopted as being the ones which will hereafter constitute regular stock sizes manufactured:—

12" x 36" or 18 gallon	16" x 60" or 52 gallon
12" x 48" or 24 "	18" x 60" or 66 "
12" x 60" or 30 "	20" x 60" or 82 "
14" x 48" or 32 "	22" x 60" or 100 "
14" x 60" or 40 "	24" x 60" or 120 "
16" x 48" or 42 "	24" x 72" or 144 "
	24" x 96" or 192 "

All sizes other than these will immediately be discontinued and when orders will be handled as calling for special design. All measurements given are based on inside diameters and length of sheet used in making the boiler.

Expansion tanks:—The following were adopted as the standard and only sizes of expansion tanks to be regularly manufactured:—

12" x 20" or 10 gallon	16" x 30" or 26 gallon
12" x 30" or 15 "	16" x 36" or 32 "
14" x 30" or 20 "	16" x 48" or 42 "

Also that the regular tappings for all expansion tanks be 13½ in. on centres which will allow of standardizing on a 12 in. gauge glass. It was further resolved to discontinue manufacturing the "short size" (e.g. 12 x 58) boiler.

This movement for the simplification of the variety of sizes and standardization of design and tappings of range boilers has the endorsement of all the prominent manufacturers of range boilers, the government departments, the standardization committees of plumbing and heating and supply associations.

Among the more responsible manufacturers of range boilers there has been the practice for some years of using inside diameter and length of sheet as the basis of measurement of range boilers. By some other manufacturers the measurements given have been outside diameters and in some cases extreme dimensions over all. Under the new standards all dimensions are to be given as per inside diameter and length of sheet as illustrated in Fig. 1.

All range boilers not conforming to the standard sizes as adopted will be considered over size or under size as the case may be and should carry a like differential in price. Over size boilers can be considered as worth the maximum of price set for the standard of size and quality under which it is sold. The under size boilers, in a similar manner, being so made for the purpose of skimping material, should likewise be considered as worth less than boilers of standard size, according to the now approved standard method of measurement.

This is because with the standard sizes of boilers as determined upon by the boiler manufacturers in session, and herewith given, the manufacturers can make these various sizes of boilers with the minimum of waste from standard stock sheets. Any appreciable variation in measurement is therefore unwarranted.

In Fig. 2, is shown a typical connection of gas water heater with a range boiler tapped according to the new standard of practice. This design was submitted by R. T. Rock of Bridgeport, Conn., member of the Standardization Committee of the National Association of Master Plumbers. This typical connection has the approval of the National Association of Master Plumbers. As shown, it also provides for connections to range water back, likewise, for connection to laundry tank heater in such manner that the most rapid circulation will be insured and short circuits prevented.

Loyal Support Should Be Given Manufacturers

"This step in simplification and standardization by range boiler manufacturers is a sincere endeavor to serve the public most efficiently and economically. Cutting out, as it does, over 100 varieties of range

Fig. 1. Sketch showing how, by new standard of practice, dimensions of range boilers are to be given as per inside diameter and length of sheet.

boilers, the stocks required to be carried by contractors and jobbers will be materially reduced and, likewise, the manufacturing cost will be lessened. Therefore, the industry and the public will be benefited because of the standardization," says Sanitary and Heating Engineer.

"However, like all changes of this kind, in various communities there will be those manufacturers who will withhold their support in order to get the business incident to supplying the demand for the old type (single side tapping) boilers.

The Influence of the Sanitary Contractor

"Since this movement to standardize range boilers has such universal endorsement, the sizes and methods of tappings as adopted will become standard practice for all manufacturers. It is to the advantage of the public and the sanitary industry that they should. The quicker—the better. Yet—withal, the influence of the sanitary con-

tractor will be most important in determining the length of time required to put this simplification and standardization as adopted, into effect.

"The influence of all manufacturers who continue to manufacture the old style (single side tapping) range boilers will be, it is said, to postpone the benefits to be had from the standardized range boiler as a universal product. It is therefore, only too evident that every time an old style (single side tapping) range boiler is ordered, moral and financial support is being given to those who, in most cases, from purely selfish motives are delaying the effectiveness and benefits of standardization. Since sanitary contractors purchase practically all the output of range boilers, it is

likewise evident that they are a dominant factor in determining the speed with which standardization, in this instance, becomes effective.

"It cannot be too strongly urged that the industry give this movement its loyal support. To do this it is necessary, when ordering range boilers, to specify that boilers shall have the new standard tappings and of sizes as simplified. To order or accept boilers of other design after June 1, 1924, is to countenance the efforts of some to profit at the expense of the sanitary industry and the public."

At the preliminary meeting of the boiler manufacturers, representatives of gas water heaters and of the U. S. Chamber of Commerce and the Department of Commerce, held on October 29, a schedule of sizes and tappings for

Fig. 2. Typical connection to range boiler tapped with two outlets on side. Submitted by member of Standardization Committee, National Assn. of Master Plumbers.

pneumatic tanks and storage tanks were adopted as per the schedule given in Fig. 3.

Also the following sizes were adopted as standard for combustion boilers and gas water heaters:

No. 18—12x36—11 gallons, allowance being made for centre flue.

No. 24—12x46—16 gallons, allowance being made for centre flue.

No. 30—14x48—22 gallons, allowance being made for centre flue.

No. 40—16x48—20 gallons, allowance being made for centre flue.

20x48—45 gallons, allowance being made for centre flue.

It was further agreed, "that all side outlets be eliminated except for thermostatic control, this fixture being special and of such a variety of design that we are rather at a loss for further suggestion toward standardization."

On motion, duly carried, it was unanimously voted to continue as a committee of the whole, the manufacturers assembled to be convened by the chairman for the purpose of effecting the achievement of the standards of practice as adopted by the conference and pledged by the manufacturers present. It was further voted that the 16x48 size, because of its evident increasing popularity with gas water heater manufacturers, be advertised by them at its actual capacity (viz. 42 gallons) rather than call it No. 18 which confuses it with the current standard 18 gallon range boiler.

All the manufacturers present announced their intention of proceeding at once to manufacture boilers according to the new standards of tapping and sizes.

CONTRACTS AWARDED

Toronto.—W. D. Butt, 33 Gwynne Ave., has the contract for heating and plumbing for \$10,000 duplex residence at Patterson and Glendale Aves.

Toronto.—P. Reading, 71 Marjory Ave., has the plumbing contract and the T. Eaton Co. the heating contract on three residences on Glenmount Park Rd., being built by Westwater & Sharp.

Toronto.—Mason & Allen, 400 Morley Ave., have the heating contract on three pair residences, \$18,000, being built on Poulton Ave. for J. Murray.

Toronto.—W. A. Brown, 331 Georgia St., has the plumbing contract and St. Catharines, Ont.—Bowman Bros. have the heating and plumbing contracts for \$6,000 residence being built on Ontario St.

Truro, N.S.—F. Dexter & Co. has the plumbing contract and C. F. Fox & Co. the heating contract on F. W. Armstrong's \$5,000 residence on Duke St.

Toronto.—Harry W. Rushby, 219 Wychwood Ave., has the contract for plumbing and W. C. Weeks, 4 Bird Ave., contract for heating in connection with three detached bungalows, \$16,500, on Wanless Ave.

Toronto.—H. J. Derrick, 47 Woolfrey Ave., has the contract for plumbing, and Parker & Ryan the contract for heating on two pair residences, \$8,000 pair, on Hunter Ave.

Bowmanville, Ont. Greenaway & Elliott have the heating and plumbing contracts on \$7,500 residence being built on Scugog St. for W. H. Lyon.

Toronto.—Belyea Bros., 1375 Bathurst St., have the heating and plumbing contracts for \$9,500 residence and garage on Laurier Ave.

Weston, Ont.—W. A. Moffatt, 86 Don Esplanade, Toronto, has the roofing and sheet metal contracts on the \$40,000 telephone exchange.

Toronto.—R. Reading, 14 Arundel Ave., has the plumbing contract and R. M. Leslie, 10 Bungalow Rd., the heating contract for three stores and apartments on Danforth Ave., near Caithness Ave.

Toronto.—Wright Bros. have the plumbing contract for the \$160,000 substation for the Toronto Electric Commissioners, Danforth Ave. and Morton Rd.

Toronto.—Jas. Downing, Jr., 68 Lappin Ave., has the plumbing contract and George Davis, 37 Boon Ave., the heating contract on one pair residence, \$7,000 each, on Lappin Ave.

Toronto.—J. Ritchie, 851 Logan Ave., has the plumbing contract and R. M. Leslie, 10 Bungalow Rd., the heating contract for \$9,000 store and apartment at 126 Danforth Ave.

Esquesing, Ont.—Mechanical Trades Co., Ltd., Toronto, have the contract for heating and plumbing of \$25,000 residence and greenhouse for Dr. Beatty, R. R. No. 4, Aston, Ont.

Port Hope, Ont.—Garnet & Sons, Port Hope, have been awarded the contract for heating and plumbing for the new telephone exchange to be built here.

Weston, Ont.—Keyes & Bull, Weston, have been awarded the heating and plumbing contracts for the new \$40,000 telephone exchange on Mill St.

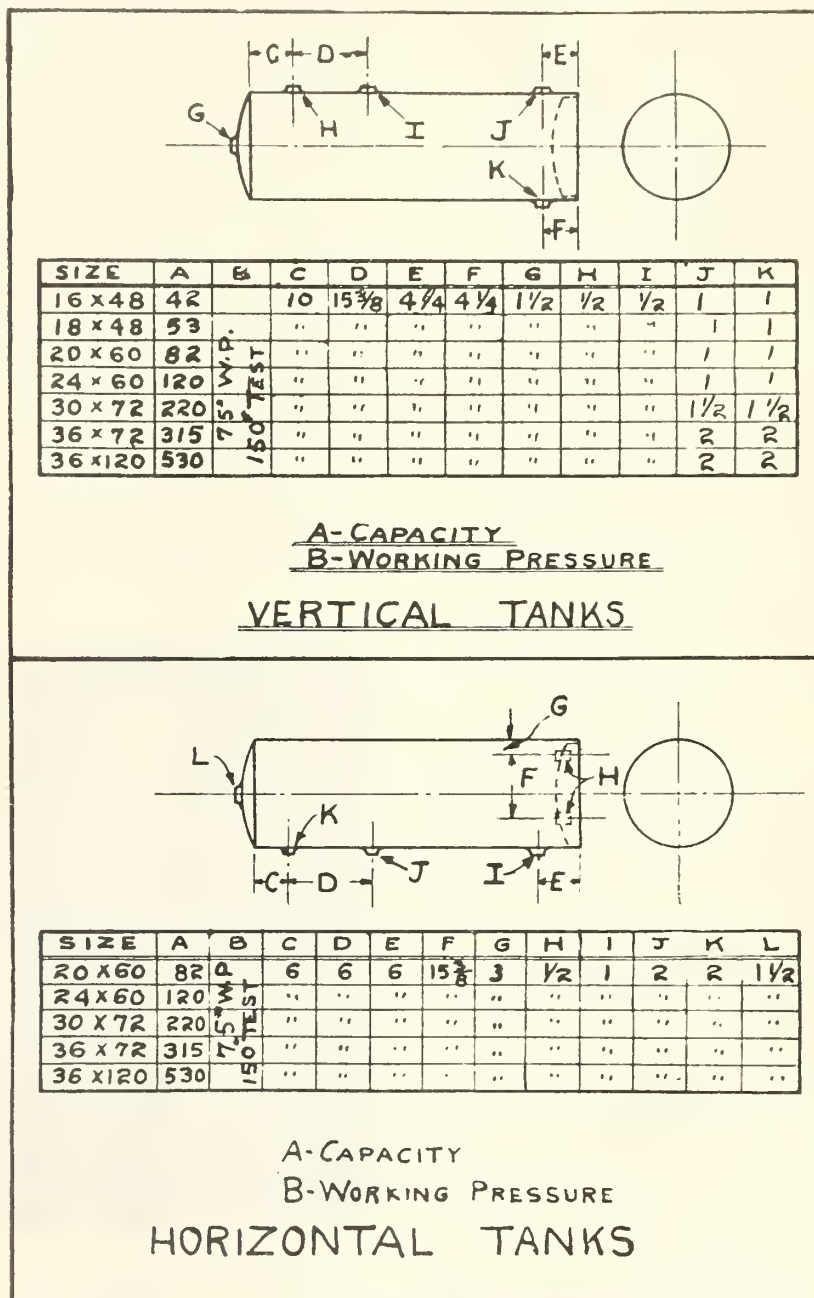

Fig. 3. New schedule of sizes and tappings for pneumatic tanks and storage tanks.

Danger of Small Capacity Tanks in Water Pressure Systems

Frequently Pipes Begin to Leak, Ball Cocks in Closet Tanks are Damaged and Other Troubles Arise With Pressure Systems, For no Apparent Reason—Expansion of Water in Range Boiler and Insufficient Pressure Tank Capacity Often the Cause

Address by MARTIN J. QUINN, President National Equipment Co., Toronto, before Hamilton Sanitary Engineers' Social Club

HAMILTON.—At the first regular meeting of the season of the Hamilton Sanitary Engineers' Club held on Wednesday evening at the Arcade, Martin J. Quinn, president of the National Equipment Co., Toronto, gave a very interesting and practical address on one or two phases of water system installation.

In introducing the speaker, Chairman C. F. Rogers, local manager of the Standard Sanitary Mfg. Co., referred to Mr. Quinn's early associations in connection with Government and other work, and pointing out incidentally that he was the one who installed the first Hydro Pneumatic water supply system in the town of Oakville, about seventeen years ago.

Mr. Quinn's address was as follows:—

If I came to talk to you about hot water heating systems, and told you that the difference between the weight of a column of hot and a column of cold water was the sole motive power that caused the water to circulate throughout the system, you would perhaps ask me to tell you something new. It is something you all know. If you did not know that this slight difference in the weight of the two columns was the entire basis of the success of such a system, you would not understand the need for careful grading, the prevention of air locks, and the use of pipes of sufficient calibre to reduce friction to a minimum, and it is easy to see how anyone unfamiliar with this basic principle would be almost certain to experience failure, in even so simple a construction as a small hot water heating unit.

The Suction Line

Now in considering the installation of a pump, it is of equal importance that we should understand the basic physical conditions that, as in the case of hot water heating, are responsible for either success or failure, and it is my intention to deal this evening with but a single phase of this kind of work, namely the installation of a suction line.

Though the principles involved are simple, we still find that the majority of men engaged in the business get more or less of a "jolt" when they hear the statement made that a pump does not actually suck water through the suction line, and it is failure to clearly understand what actually happens in this line when a pump is in operation, that produces a very large percentage of the pump troubles encountered. No part of the system requires as careful attention during its installation as the suction line, and frequently no part gets less.

Now, what actually happens when a pump connected to a suction line is put in operation?

For a complete understanding of the physics of the case we must remember that we exist in an atmosphere having a consid-

erable pressure, varying with the altitude above sea level. This pressure is created largely in the same way that pressure on the bricks of a building is produced, those nearest the foundation supporting a much greater weight or pressure than those near the top. In other words, the nearer we are to the sea, the higher is the bank of air, and consequently the greater is the pressure per square inch, and at sea level this pressure is approximately fifteen pounds.

Inversely, the higher we go in the mountains the less becomes the weight of air, and the consequent pressure to the square inch. Now, as the law of gases and fluids is that the pressure is equal in all directions, it follows that when a pump is put in operation, and a portion of the air is drawn out of the suction line, a partial vacuum is created in the latter, and the pressure downward on the surface of the water in the well will force the water up into the suction line to exactly balance whatever degree of vacuum has been obtained, and as the pump continues to operate and expel the air, thus creating vacuum, the external pressure will continue to make the water follow this vacuum right into the valves of the pump, and once through the valves, the water then is pushed by mechanical force to any distance or any height or pressure, depending upon the power of the pump and the amount of energy exerted.

MARTIN J. QUINN

President National Equipment Co.,
Toronto.

It will be seen, therefore, that as the elevation of water on the suction side of the pump depends entirely upon atmospheric pressure, that no pump, no matter how expensive or well built, or no matter by what amount of power operated, can set up a condition that will cause water to rise beyond the height arbitrarily fixed by the atmospheric pressure, at the altitude at which the pump is installed. Indeed no pump has ever been designed that will produce a perfect vacuum, and perhaps the nearest approach we have in commercial practice to that condition is in the manufacture of electric light bulbs, where the entire absence of air is of prime necessity, but even here, and with the most perfect appliances, a complete vacuum has never yet been produced.

Now, if we have an atmospheric pressure of fifteen pounds to the square inch, attempting to force its way in at every joint of the suction line, and if a vulnerable point exists and the air is forced in under this pressure, it will be seen at once that the vacuum will be lost, and the pump will fail to deliver water.

It makes all the difference in the world where a leak exists; for example, if a small leak were present at a point say two inches above the water level in the well, it would have a very much less serious effect than if it existed at a point much higher up, and close to the pump, for the reason that in the first instance the difference in water level, namely two inches, is so small as to form scarcely any resistance, but with the leak existing say twenty feet above the water, then the difference in pressure necessary to raise the water this twenty feet is so great that the atmosphere would be forced in in such quantities as to entirely break the vacuum.

Size of Plunger Important

Another feature that has a considerable bearing upon the effect of minor leaks in a suction line is the size of the plunger, or in other words, the displacement capacity of the pump.

A small pump of the type usually used in domestic installations, having a plunger of perhaps not more than one inch diameter, would naturally be much more seriously affected than would a plunger of four or five inches in diameter, as that in the latter case. While a small air leak would naturally affect the pump to the extent of a moderate percentage of its total displacement, it would perhaps prove fatal to the operation of the smaller pump.

I believe that ninety per cent. of all pump troubles are due to carelessness in the installation of the suction line, and this lack of care if manifested by the presence of leaks at the joints, or of dirt left within the line that will subsequently be drawn up

under the valves and keep them off their seats.

As to the presence of foreign matter under pump valves, it may be enlightening when I tell you that actual tests made with more than one type of small domestic house pumps, indicated that the valves when in operation do not rise more than about one thirty-second of an inch from their seats, so that it is easy to see that if a little paint or scale or sand remains on these valve seats, that the water displaced by the plunger will simply pass back and forth through the valves in this condition, and will not be discharged from the pump at all.

As indicating the lack of thought by some plumbers regarding the great importance of this phase of pump installation, I recall a personal inspection of a small pump a short time ago, which was not giving a satisfactory account of itself, but for which condition, after carefully questioning the plumber, I was unable to formulate any reasonable theory.

Took Out Pieces of Granite

When this pump was taken apart, I took out of the valves about a teaspoonful of small pieces of granite which had been washed down into the cistern from a certain type of patent roofing. These particles were about the size of the sulphur end of a small match, and turning to the plumber I said, "You told me that you had examined the valves repeatedly, and the seats were always perfectly clean," and his reply was, "Well we have pumped about a painful of that stuff, but I did not think that small pieces like that mattered much."

In most small pumps, a fine wire screen is placed to prevent just such matter from reaching the valves, but to such an extent has trouble developed, due to this screen choking up with paint used with extravagant liberality by the plumber, that manufacturers have been forced to use a very much coarser mesh, and this oftentimes allows foreign matter to get to the valves, which certainly should never reach them.

Let me warn you as strongly as I can against putting paint or "dope" inside the fittings of a suction line. Always put it on the threads of the pipe, so that when the latter is screwed into the fitting, the surplus will be squeezed off on the outside, instead of up into the fitting on the inside, and from there be carried right up into the screen, or through it on to the valves of the pump.

Rap on Pipe

Always rap each length of pipe used in the suction line with a hammer, to take out any loose scales, and thus make sure that when the pump goes into operation nothing but water will reach it.

We are often asked the question, "How large should the suction line be?" and our answer must always depend on the amount of water that is required per hour, and the length of line through which it must be forced. If, for example, a suction line is installed for the delivery of say twenty gallons per minute, it follows that always that amount can be forced through it without very materially increasing the frictional resistance, and as friction increases as the square of velocity, this becomes a mighty important factor.

Friction in a suction line in fact is the same as increasing the suction lift, so that while a line might be capable of delivering say twenty gallons per minute from a depth of 22 feet, it might be entirely inadequate in calibre if an attempt was made to deliver an additional volume of water, which would perhaps set up a resistance equal to a suction lift of another 20 feet.

As the frictional resistance depends on

W. BRITTAIN

Bloom & Brittain, Hamilton, Ont., elected vice-president of the Hamilton Sanitary Engineers' Social Club for the season 1923-24.

two factors, first the volume of water pumped per minute, and secondly the length of pipe through which it is discharged, it follows that the size of this pipe will be determined by first ascertaining the total lift, and then using a pipe of such internal capacity that will cut down the frictional resistance to within safe limits.

Fortunately, limit area in a discharge pipe is not so serious a matter, though it is of great importance, because it costs only half as much for current to deliver water at forty pounds pressure as it would to deliver the same volume of water against the same pressure, plus frictional resistance, due to small calibre and long length of pipe of perhaps another forty pounds.

It is important that the suction line should have a continuous rise from the foot valve until it enters the pump, but it sometimes happens that it is difficult to obtain these conditions, and that the line must be

HAMILTON S. E. S. DINNER SCHEDULE

The Sanitary Engineers' Social Club of Hamilton, the account of whose first regular meeting of the season will be found in this issue, have arranged an interesting program of dinner meetings for the coming months, to which they are extending a cordial invitation to anyone connected with the plumbing industry. The dates of the dinners, which are held in the Arcade Dining Hall from 6.15 to 8 p.m., are as follows:—

*November 21,
December 5,
December 19,
January 16,
February 13,
March 12
March 26,
April 9,
April 23.*

dropped after it enters the cellar, and before it reaches the pump.

In such a case be sure to make the point where it comes through the wall the very highest one. Fit this point with a tee instead of an elbow, and put a plug in the top of it, so that if there is any difficulty experienced in getting the "prime," due to an air lock in the high part of the pipe, this plug may be removed, and water slowly pumped in until all of the air is expelled through this high point, and the line entirely filled with water, when if a plug is put back tightly, the pump should go into operation at once.

You may be absolutely certain of one thing, that is that whether the pump you are using is of the highest quality, and most expensive type that you are able to buy, or cheap \$5.00 sink pump, if the plunger fits the cylinder snugly and the valves fit down closely and tightly on their seats, it will be certain to operate properly and successfully if the simple conditions demanded in the construction of the suction line have been fully complied with, and water is available within suction distance.

One of the difficulties with which we have frequently to contend is the plumber's sincere conviction that his suction line has been properly tested, and has proved to be tight, when all he is depending upon is the fact that before the pump was connected, the whole line had been filled with water, and had remained full for perhaps a day or two.

Not A Test

As a matter of fact, this constitutes no test at all.

Let us assume that a suction line leading from a pump is 50 feet long before it reaches the well, and then drops down twenty feet. If this line is filled with water, there will be a "head" at the foot valve equal to twenty feet, but on all of the horizontal part of the line this head may not be equal to more than six inches or less than one quarter of a pound, whereas as the pump is put into operation, the atmospheric pressure is capable of exerting itself against every joint to the extent of ten or fifteen pounds, or forty or fifty times as much pressure as that exerted during the "test."

The only safe way to test a suction line is with a good stiff interior pressure, never less than fifty pounds, and if air is used, go over every joint with soap suds, when rising bubbles will indicate a defect, and if water is used, be sure also to go over every joint, and leave the pressure on for an hour or two.

Do not be content with pumping up a suction line full of air say to fifty pounds pressure and watching the gauge for ten minutes. Air is such an elastic force, that a considerable amount may be escaping through one or more points, and if the suction line is of considerable length, the elastic volume will fail for quite a little while to show any change in gauge registration, and thus the plumber may be deceived.

Rarely Trouble In Pump

After you have put your pump in operation, and it does not "deliver the goods," then you must by a process of analysis, determine what the trouble is, and it will rarely be found in the pump itself, because all manufacturers test their equipments before they leave the factory.

It is possible, however, that the water left between the valves and the brass seats may in drying out, have caused these two units to stick together so tightly that the valves on the suction side cannot be drawn off their seats, and this is a condition that simply cannot be provided against.

If you have any suspicion that this has

Shop windows can be used to good advantage during the next month to boost the sale of heating equipment as Christmas gifts. Gas ranges, electric heaters and appliances all are well suited for gifts and suggested through a window trim should produce good results.

happened it is only necessary to carefully remove the valves, wipe them and the seats off and replace them, being sure that the valves are wet, so that they will make a better seal for the expulsion of air.

Having assured yourself that the valves are in good condition, the next step will be to ascertain whether any air leak exists, and perhaps the most simple way of doing this is to turn the discharge pipe from your pump down below the surface of a glass or pail full of water, and put the pump into operation. If bubbles continue to be discharged from the discharge line so submerged, you may be certain that air must be coming in at some point between the pump and the well.

If it is possible to pump any water, you may succeed in finally getting a good pressure pumped up in the tank, and then if the valves are removed from the pump, this tank pressure might be turned right back into the suction line, and indicate for you without further trouble, where the difficulty lies.

It is assumed of course that in the first instance you will make sure that plenty of water is available within suction distance, and that the foot valve is not submerged in sand.

When a system is put in operation ordinarily it is a good practice to pump enough air with the water to establish an air line about half way up the water glass, but of course while pumping air, the capacity of the pump for delivering water will be very materially diminished.

Just a word in conclusion about tanks. Be careful to avoid tanks of very small capacity. For example, there are four or five so-called tankless systems, which, however, fortunately have not been very extensively sold, but in many of these installations, plumbers have wondered why they are frequently called after a plumbing job has been installed, to repair leaks in the water pipes, and damaged ball cocks in the closet tanks, which for some unaccountable reason would start to leak.

The explanation will usually be found in the expansion of the water in the range boiler.

As is very well known, water will expand from thirty-two degrees up to the boiling point, about five per cent., and this in the case of a thirty gallon boiler is equal to one and a half gallons.

Now if you only have a four or five gallon tank, and indeed there are such things on the market as one gallon tanks, where is this gallon and a half of water going to go? It is a pretty safe bet that some of it is going to come down through the ceilings of the house, and you are going to be called upon to foot the bill.

Big Increase in Pressure

To understand what tremendous strains are exerted by the mere expansion of water under such conditions, it will only be necessary to say that a boiler full of water with all valves closed off, expanding from 90 degrees to only 110 degrees, will increase an initial pressure of 75 pounds, up to about 270 pounds.

For that reason then, if for no other, use plenty of tank capacity. But there is another reason. Tell your customer about it. And that is that he can double or triple or quadruple the capacity of his system at an increased cost ranging from five to twenty dollars.

Speaking of tanks, we need not say that we confine our manufacture only to the extra heavy rivetted caulked joint type, which owing to their construction, we are able to guarantee for ten years, and while this type of construction is naturally the most expensive, it is nevertheless surprising that complete units, including such tank construction of liberal capacities are invariably lower priced than any foreign made competing types.

It will be a pleasure to me at some future time when the opportunity presents itself to discuss some other phases of what we consider an intensely interesting business, namely, the manufacture of water supply systems.

B. C. PIONEER DIES

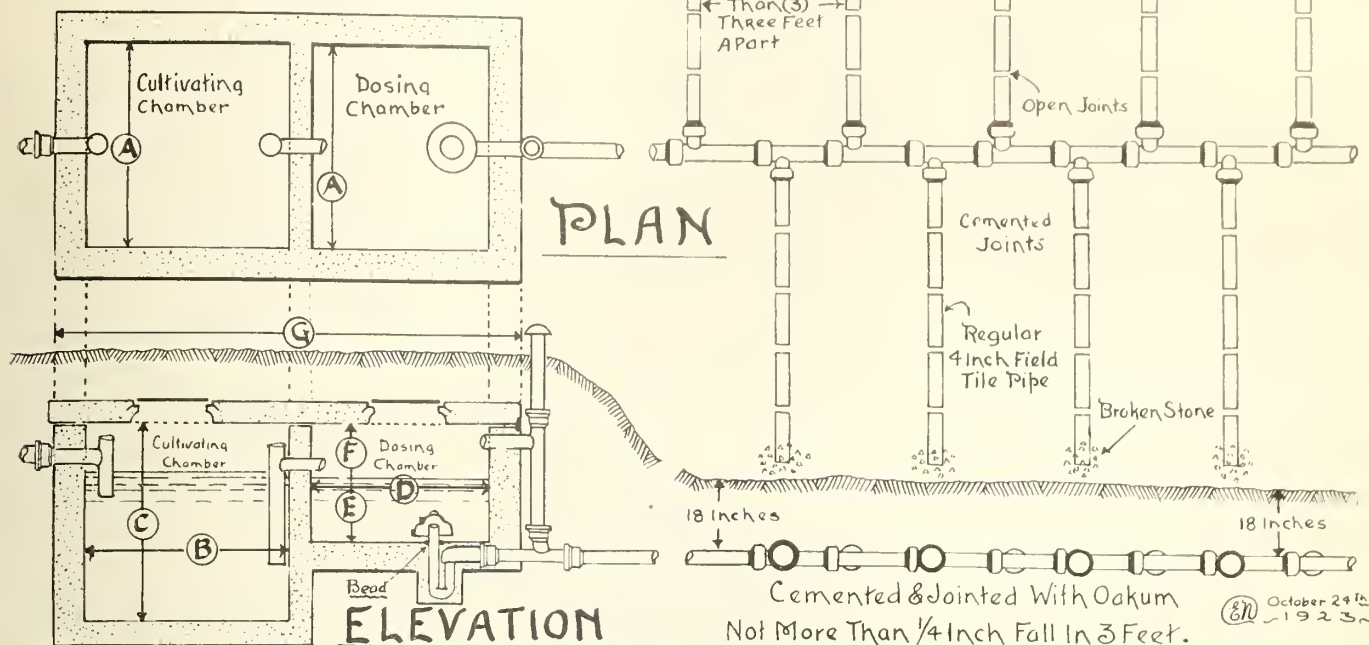

Andrew Gray, one of British Columbia's real pioneers, passed away at Victoria a few days ago. Some 53 years of his life had been spent in the province, the majority of them being years of industrial activity, the Victoria Machinery Depot, the Marine Iron Works, and the Albion Stove Works owing much to his enterprise and initiative.

Important Note

IN THE sewage disposal article which appeared in the last issue of Sanitary Engineer, the cut shown on opposite page appeared without the information which is given in the key below it in this issue. Without the key the illustration is not of much use for reference purposes and it is therefore reproduced again in this issue complete. The page with the references may be kept for frequent use in connection with septic tank jobs of various sizes.

PLANS AND SPECIFICATIONS FOR SEPTIC TANKS— And Sewage Disposal Systems For Rural Homes And Unsewered Districts.

All Hub Joints Must Be Cemented
All Open Joints Should Be Covered With Coarse
Gravel Broken Stone, Railway Cinder Etc.,
All Laterals Must Be At Least 3 Feet Apart—
Laid Level, $\frac{1}{4}$ Inch Opening, Not More Than
18 Inches Or Less Than 12 Inches Below Surface.

Don't Forget To Install The Syphon Perfectly Level, With Bead At Floor Of Dosing Chamber.
Always Prime The Syphon By Filling Both Legs With Water Before Placing Bell In Position.

Showing Details, Sizes and Measurements for Septic Tanks (See Plan and Elevation)

See Letters on Plans Above		A		B		C		D		E		F		G		Lineal Feet of Field Tile	Cubical Contents	Gallons Discharged
No. Persons		FT.	IN.	FT.	IN.	FT.	IN.	FT.	IN.	FT.	IN.	FT.	IN.	FT.	IN.	4in. Diameter	In Feet	Per Flush
Four	Persons	3	5	4	—	3	6	3	3	1	5	1	1	9	1	216	15 $\frac{3}{7}$	108
Six	— do —	4	—	5	—	3	6	5	—	1	5	1	1	11	10	324	23 $\frac{1}{7}$	162
Eight	— do —	4	—	6	—	3	6	6	6	1	5	1	1	14	4	432	30 $\frac{6}{7}$	216
Ten	— do —	5	6	5	6	3	6	6	—	1	5	1	1	13	4	540	38 $\frac{4}{7}$	270
Twelve	— do —	6	6	6	6	3	6	6	6	1	5	1	1	14	10	648	46 $\frac{2}{7}$	324

THE above figures given in table are based upon a daily allowance of 27 gallons of water per person.

Do not encourage the use of fewer lineal feet of field tile because the ground appears to be more porous than usual. Such ground is very advantageous and will ensure a more perfect disposal system as a rule.

Be sure and warn the occupants of a home against the use of any kind of anti-septic soaps or solutions where a sewage disposal system is in use. Such fluids and soaps will kill the friendly germs and result in creating the reverse of sanitary conditions.

Additional copies of this page can be procured on request.

Windows Help Overcome a Big Plumbing and Heating Business Problem

WINDOW Display No. 125 hardly needs description. All that is required is to arrange curtains with pedestals of varying height to carry the exhibited articles. Cover the floor of the window and these pedestals with soft cloth (tan Ramie cloth will do) allowed to lay loosely in natural folds.

Place the tools, for repair of a closet tank, on the floor of the window at the right—those for repair of a flush valve, at the left—in front of the pedestals on which you show the parts necessary for that class of repair. In the centre, exhibit the parts involved in a closet seat repair, and back of this, on its pedestal, a frame with a large card or poster.

Can't you see how this display in your window would create a real demand for better material and service on repairs; and help to end the "grief" arising out of trying to get fairly paid for such service?

Window Display No. 126 is a striking and very effective exhibit, to centre the attention of the passerby upon the advantages of automatic heat regulation. It also suggests a practical method for using display material which can be secured from most manufacturers of apparatus for heat and temperature control. Some of these manufacturers al-

ready have such display units assembled which they are willing to supply to heating contractors on terms and conditions which are very attractive. It is altogether probable that any of these manufacturers would be pleased to co-operate in this way with any heating contractor sufficiently interested to write requesting such service.

The display board shown on the high pedestal in the centre of the window, is arranged with clock, thermostat and motor in sight, on the front of the board with appropriate reading matter on the board explaining each part. There is an opening in the board, back of which is a slide that is fitted from one position to another, displaying different legends in each of the positions. This slide directs attention to the fact that when rooms are too warm, the automatic regulation closes drafts and opens check dampers; and that when rooms are too cool, the opposite action occurs.

The motor is properly connected up to the electric wiring lines in the show window or room; and a small lamp is included in the circuit, appearing just above the thermostat. By means of an interrupting switch the motor is caused to operate at short time intervals. Thus the slide on the back of the main display board is raised and lowered. Thereby

the two different legends on the slide are alternately brought to view through the space provided in the face of the display board.

In connection with the shifting of this slide, the lamp above the thermostat lights and goes out. By this simple device a large amount of interested attention is bound to be created.

The particular manufacturer whose display board we have used, or any other manufacturer of any heat regulating apparatus, will be glad to receive any inquiries concerning such a display outfit.

With the photograph to guide you, the arrangement of this display in your window is a very simple matter. It calls only for a pedestal of some sort at the rear centre of your window, of sufficient height to bring the centre of the display board opposite the eye level of a person on the sidewalk. Then at each side, toward the front of your window, place similar pedestals about one-half as high as the one just referred to. Cover the floor of your window and the pedestals with soft, light colored cloth, allowing it to fall in natural folds.

With screens or drapery of height sufficient to cut off any view of the interior of the store, provide a suitable background for the display.

"Better to Forget to Put in a Bath Tub Than to Forget Overhead"

Large Volume of Business With Receding Price Tendencies Foretold by Frank Sutcliffe, President of John Wood Mfg. Co.—
Martin J. Quinn Emphasized Duty of Individual in Armistice Day Talk

A HIGHLY optimistic outlook for the future of the plumbing trade and business in particular, and for the future of the Dominion of Canada in general, was voiced by Frank Sutcliffe, president, the John Wood Mfg. Co., Conshohocken, Pa., and Toronto, Ont., who addressed the Live Wire Club, Toronto's recently-organized plumbing trade club, at their dinner in the Board of Trade rooms on Thursday.

Speaking from his personal observations, made during business trips which have carried him into all parts of Canada and the United States, Mr. Sutcliffe was emphatic in predicting for the trade an unprecedented volume of business during the year to come. Basing his predictions to a certain extent on what had already been accomplished, he stated that where a few years ago there were but 400,000 bathrooms in the United States, that last year equipment for 972,000 was manufactured and sold, the plumbing business of the United States representing \$36,000,000 and now being one of the biggest industries in the country.

"On top of these figures for last year," he added, "this year is again one of the best to date and next year will be even better from present indications. We are going ahead by educating the people on the health value of sanitation. Insurance statistics have shown that the average prolongation of life has been about ten years per person greater of late, much of the credit for this going to better sanitation.

Canada's Industries Solid

"In our product we have turned out in tanks and boilers this year, about 400,000 pieces. The growth of the industry is more than some of us can realize. While I have quoted largely from my observations in the United States, the same condition holds good in Canada. I know enough about your country through my several trips from coast to coast to know that your lumber, asbestos and farming industries are solid. The fundamentals are here and the time of development has arrived. The opportunities in this country will be greater than some think during the next decade.

"We are going to have a large volume of business and we are going to have receding prices because of the capacity of the factories and the keen competition. I do not believe there will be

any violent fluctuations, but that conditions will bring about a receding tendency.

"Of course, it will continue to be up to the individual to take advantage of the opportunities thus afforded him. I believe it better for a plumber to forget to put in a bathtub than to forget his overhead. He must be sure of his costs before he starts. If he does, there are so many opportunities that there will be nothing to stop him from going ahead.

"He will have to make himself known, but if he advertises, let the advertising

NORMAN SWANSTON
Former president, Ontario Society D., S. and H. E., and now member of the executive committee of the Live Wire Club.

be constructive. Let the other fellow monopolize the tricks. They're not worth while."

Armistice Day Message

Along an entirely different line, but equally forceful, was the Armistice Day message conveyed to the gathering by Martin J. Quinn, president National Equipment Co., Toronto, who carried his auditors back five years to the first Armistice Day, touching on the thoughts that had come to him at that time, of what Canada and Canadians would have to do to make the sacrifice of her soldiers more than a vain wasting of effort and life.

In his thoughts at that time, he had come to the conclusion that what was done along such lines would have to be done by the individual, and that of the many classes of individuals in Canada he could find none better fitted to carry

on independent constructive thought and deed than members of the plumbing trade, men who were trained to think and act independently from the very nature of their work.

"My thoughts along these lines," said Mr. Quinn, "convinced me that I want to be nothing better than a plumber, for I think there is nothing better than a plumber. Think of his importance in the great plan of things. Many other industries could cease to-morrow and with a slight re-adjustment of our mode of living, the loss would have little lasting effect, but let us awaken to-morrow and find that every man-made source of water supply and drainage had disappeared, imagine what it would mean in the lives of everyone.

"Too few of us give consideration to such angles and tend to minimize our own importance. As an example of what I mean, let us say you go to a doctor regarding some ailment. Before treating you the doctor will diagnose the case, then treat you accordingly. But, let the same doctor come to you and tell you that he wants certain equipment put in his house. You go ahead and put it in, never stopping to properly diagnose his case and suggesting equipment best suited to his needs. Most people outside the trade understand very little about what they should have and will welcome your advice, rather than to have to make their own selections in a somewhat blind fashion. Make suggestions, put in good jobs and you will inspire confidence and secure customers who will in turn be your best advertisers.

"As good citizens of this country we owe it to the manufacturers of the country to give them our support. No country can be truly great that sends across its borders the profits that should enrich its own people. It is the duty of every intelligent man to think before every act and come to the proper conclusion of the effect that act will have on his country."

Other items on the program included the reciting of the famous Cockney war poem "What the 'ell Bill" by George Baker and a vocal solo by Roy Belyea, who also acted as chairman of the meeting in the unavoidable absence of Major Laurie Anthes.

About eighty members of the plumbing trade were in attendance at the dinner, all details being well looked after by the committee.

Questions and Answers Regarding Plumbing and Heating Practice

Hard Water Causing Some Trouble

Trouble From This Cause in Hotel, Heated by Steam Boiler and Also in a Big Residence

Editor Sanitary Engineer: From time to time I am called into places to clear lime out of the water fronts and heaters used to heat water in range boilers. The water in our district is very hard and I believe if I knew of some real good remedy that would overcome the trouble, it would not be a matter of price that would prevent me from doing a good service to the people in my locality.

Just at the present time I have two jobs in mind, one in the hotel, which by the way, is heated by a steam boiler (low pressure) and the other is a big residence, where a 40 gallon boiler is used and a very large kitchen range.

Neither of these customers of mine would have any objections to paying for a fool-proof job, so if you can let me know how these jobs could be remedied, I would be very much obliged. I omitted to state that the hotel has a square sectional boiler in it.

Yours truly,

A. B. C.

Hard Water Trouble

The writer was out with a demonstration truck this summer and visited over 120 towns in Ontario and the above two cases were brought to his attention, and there are hundreds of similar conditions all over Canada; therefore, the replies

no doubt will interest many of our readers.

To overcome the trouble outlined in the above questions, the best way would be to adopt what is known as the indirect method of heating water. This can be done by using either hot water or steam as the heating medium. As a matter of fact, there are quite a number of specially designed indirect heaters that would do the work, but in both these cases the problems were solved in the following manner:

The hotel system is described where the square sectional boiler is illustrated. A range boiler fitted with a copper coil is slung up to the rafters or joists. In the sides and ends of the boiler, special tappings are made and the copper coil is supported with copper braces before the heads of the boiler were put in place. Such a heater can be made up by using a piece of large pipe, making up a copper coil, using flanges for the ends in place of ordering a special boiler.

The top pipe of the coil is connected to the steam header and the lower pipe of the coil to the return header. An air relief valve of large capacity would be the ideal fitting to use under these conditions. Then it will be seen that the water supply is connected to the bottom of the heater or horizontal boiler (as the case may be), while the hot water

supply to fixtures is noted by the word "flow," as well as the pipe which is shown at the top of the boiler.

With the residence job a somewhat different method must be adopted, though the principle is the same. A similar heater (horizontal) could be made up, provided that the soft water receptacle could be installed higher up, say, in a room above, but by following out the details shown in the illustration, a good job can be done.

A 40 gallon range boiler made up with a copper coil is shown in the illustration. The coil is connected up in the regular way, that is, the side outlet, which is the top of the coil, is connected to the top of the range water-front, and the lower outlet of the coil is connected to the bottom tapping of the water-front, using metal to metal or other unions at the boiler.

Next, make up a small cylinder from a piece of 6 inch pipe, with caps or reducers for the ends. A small filling cap should also be provided in the top of the cylinder, and soft water poured into the cylinder until it is about half full. A small pop, or safety valve, would improve the job considerably, and if the water supply in the cylinder is attended to, no doubt the trouble with water choking up the pipes will be overcome altogether.

The length of the 6 inch pipe need not be more than 14 inches and the water only about a foot higher than the top loop of the coil. Water should be drawn off at the faucet under the range boiler at intervals of not less than once a week.

—Technical Editor.

Water Heats Too Slowly in Range Boiler

Improving Such Systems Without Enlarging Either Water Jacket, Coil or Boiler

Editor Sanitary Engineer: I have a job to fix up where the water does not appear to heat quickly enough. The coil in the furnace is big enough, I am sure, and it has been cleaned out. So has the piping; but I think the conditions are somewhat out of the ordinary. The job is in a small hotel in the country. Very often the water is run off very quickly,

then, before the coil has time to heat the whole boiler full of water, another supply is needed by the roomers.

Could you suggest any way to improve the job? What size of piping would you advise? The boiler has 40 gallons capacity. The job works slow, winter or summer. In summer, when the furnace is out, a small jacket heater

put into commission. A reply to above will help.

Yours very truly,

R. J. P., Ontario.

The symptoms described in the above question lead one to think that both the coil and the jacket heater are too small, or it could also be that the range boiler too is not large enough.

However, it is no doubt possible to help circulation somewhat by connecting the boiler as shown in the accompanying illustration, and it would also improve the job if one inch pipe is used throughout. No doubt $\frac{3}{4}$ inch pipe is installed and if the run is a little too long, it is likely that would also retard the circulation.

The connection on the top of the range boiler should not be reduced, but kept full one inch size. The supply from the top of the tee could be reduced, of course. The writer has improved several jobs in the same manner as suggested, without enlarging either water jacket, coil or boiler.

Water should also be drawn off at the faucet in the basement quite often so as to keep the quantity of sediment from accumulating. This would very soon result in closing up the lower pipe and finally checking circulation at that point, and preventing the water from heating as readily as it ought to do when all the piping is kept clear and free from obstruction.—Technical editor.

HORRIGAN HEATING SYSTEM

Thomas Johnston Co., Ltd., Summer-side, P.E.I.—

We have a Horrigan expansion tank installed in a basement for a hot water heating system, instead of the ordinary gravity feed expansion tank. As the Horrigan system is in need of some repairs, we wish to have the name and address of the makers. Could you supply us with this information?

Answer:—This system is manufactured by the Horrigan Supply Co., 420 S. 4th Street, St. Joseph, Mo., U.S.A.

CONTRACTS AWARDED

Toronto.—J. Elliott, 98 Concord Ave., has the plumbing contract for \$8,500 residence on Weyburn Crescent.

Point Grey, B.C.—Barr & Anderson have the ventilating and heating contracts and Murray Bros. the plumbing contract on the \$750,000 science building for the University of B.C.

Port Arthur, Ont.—H. R. Sime, Port Arthur, has been awarded the heating contract and Purdy & Mansell, Ltd., Toronto, the plumbing contract on the \$175,000 court house being built here.

Quebec, P.Q.—Jobin & Paquet have been awarded the heating and plumbing contracts for the medicine school being built for the Seminary of Quebec.

Sandwich, Ont.—J. L. Seiber, Windsor, Ont., has the plumbing and heating contract on the \$12,000 residence being built on Partington Ave., for F. Prince, Windsor.

Heating and Ventilating Department

Induced Warm Air Circulation and Automatic Draft Control

While Not a Cure-all, Tests of 120 Installations Said to Have Proved That Induced Circulation and Automatic Control is Real Need

By M. C. HONEYWELL

IN PRESENTING the picture of the need for the benefits from induced warm air circulation, we will draw upon our practical experience during the past season. We have been very definitely impressed by the receptiveness of the warm air trade to induced circulation, by the ready acceptance of its apparent benefits by the owner prospect, and by the united enthusiasm of the dealer and of the owner wherever an installation has been made. This picture is based upon fairly close contact with both dealer and owner in approximately one hundred and twenty separate installations that operated during the winter of 1922-1923. We have no desire to spend our money in producing, advertising and selling instruments that cannot be honestly classified as heating necessities. To that end we watched closely these 120 installations to make sure that there was a genuine need for an induced warm air method or system and that definite tangible benefits were a result. Because of our close contact with these test installations we are more convinced than ever that there is a definite need, that definite benefits do result from, and that a definite market does exist for induced warm air circulation.

In our patent investigations made several years ago, we found traces of efforts along this line some 30 years back. And from that time down to the present, there have been haphazard attempts to evolve something along this line, but apparently there has never been any one concern concentrated upon the various problems until the past several years. The idea then is not new, but has been in men's minds for a long, long time.

Many Experiments in Past

Unless you have investigated the matter you would be amazed to know the number of owners and of dealers over the country, who have been experimenting with common desk fans and fans of all types and sizes in an endeavor to overcome certain conditions that exist in many warm air furnace installations. The fact that makeshifts have been used in considerable numbers seems to us to pretty definitely establish the fact that the need for induced circulation is recognized.

Warm air furnaces are installed in

all types and kinds of homes and are fired by all kinds and types of men and women. These are factors beyond the control of the furnace manufacturer, jobber and dealer, and yet factors that have a very direct bearing on the satisfaction delivered by the furnace.

In a straight gravity system, the size and spacing of the studding as fixed by the house builder, definitely controls the size of the wall stacks of the furnace man. The dealer probably has nothing to say about this factor—he simply takes what he finds and makes the best of it.

The location of the house, its exposure, the variability and intensity of the prevailing and of the occasional winds, all definitely affect the delivery of heat. And it is delivered heat, and that alone, that interests your customer. In reality the owner cares mighty little about the size or shape or material of any unit—he is greatly interested in what it accomplishes and if the results are satisfactory, he then confers upon the unit and upon its construction his whole hearted approval and recommendation.

The delivery of warm air (the thing your customer is interested in) depends upon circulation. Circulation in a straight gravity job depends upon many variables that are not subject to control and because they cannot be controlled, directly affect the degree of satisfaction experienced by the owner.

Automatic Control Assures Delivery of Warm Air

But add to the variable action of gravity flow, the positive direction of automatically controlled induced circulation and you are assured of warm air delivered in the rooms when it is wanted.

The winds may blow from the northwest or from the southwest or from any other direction, but with an automatically controlled fan, gently, but positively, delivering a definite volume of air through the flow pipes, your customer is certain of obtaining that which he intended to buy — delivered heat. Gravity is too slow, too uncertain, too unreliable under many conditions. Controlled positive circulation is certain, is reliable, is fast under all conditions.

Lower register temperatures are desired by all furnace manufacturers. Lower register temperatures mean lower heating chamber temperatures. But lower chamber temperatures mean fewer cubic feet of air per minute, delivered through any given size of flow pipe if gravity only supplies the circulation. Instead of 175 degrees to 190 degrees at the register face, a volume of air delivered at 140 degrees would be much better. It is a real problem, however, to get such a temperature and still deliver the number of B. t. u.'s required in the rooms without excessive piping and oversize furnaces under gravity circulation. On the other hand, a properly designed and controlled fan will increase the volume of warm air delivered by at least 100 per cent. Through induced circulation it is possible to obtain this much desired condition of lower register and heating chamber temperatures.

Aids Humidification

Through the lowering of these temperatures we deliver warm air with a greater moisture content and during the next few years a great deal of attention will be directed toward a study of ways and means of keeping the air of the home at the proper humidity. The medical fraternity all protest against the dryness of the air in our homes and induced circulation, when directed toward the reduction of high heating chamber and flow pipe temperatures, is a step toward the goal of proper humidification by keeping moisture in the air instead of driving it out through the excessive temperatures required for gravity circulation.

One of the chief causes of deterioration in a warm air furnace is the temperature to which the castings are constantly subjected. By materially increasing the velocity of the air passed over the outside faces of the castings, we wipe off the heat quicker and reduce materially the temperature of the casting, thereby prolonging to a decided degree, not only the life of these expensive heavy castings, but the life of all parts of the furnace casing.

By at least doubling the volume of air circulated, we thoroughly mix the air in both the heating chamber and in the rooms above. Because of the increased velocity, the temperature difference between the ceiling and the floor is very materially changed. Instead of finding an excessive temperature at the ceiling level, a fairly uniform temperature holds throughout the rooms and the heat wasted under a gravity system in uselessly heating the ceiling air, is made available, in the occupied levels of the room, through induced circulation.

In a warm air furnace operating with gravity circulation, a certain amount of coal must be burned to produce this circulation. From all information we can gather, this fuel, consumed solely to produce circulation and in no way contributing to the warmth of the house, except as it produces circulation, amounts to from 10 per cent. to 20 per cent. of the total fuel burned. Induced circulation removes the necessity for burning this fuel to produce the superheat that makes gravity circulation. This saving in fuel will pay for a reasonable, satisfactory, induced warm air method and make available its many advantages without costs, if a three to five year period is taken. Coal at \$10 to \$20, in many localities, a ton, is well worth saving.

Induced circulation, we believe to be a fine thing, but we also believe that unless the positive fan flow of the air is controlled and only permitted to operate when conditions in the furnace are favorable, there are some disadvantages to increasing the circulation beyond its natural gravity flow. To this end we have designed a Thermostat to operate in the warm air chamber of the furnace, and this thermostat controls a switch in the fan circuit; closing this electrical circuit whenever the air in the chamber is hot enough to be of heating value in the rooms and opening the electrical circuit whenever the air is too cool.

Automatic Control Important

Should the furnace fire be low for some reason, the air in the heating chamber probably will be at a comparatively low temperature and, therefore, of little heating value in the rooms of the home. Under these conditions we allow gravity to work as slowly as it will because our thermostat, as we call it, sensitive to temperature, opens the electrical fan circuit and the fan can not operate. Suppose the fan were permitted to operate at all times. Heating comfort, as we understand it, is largely a matter of feeling or sense. True that a thermometer is used to measure temperature, but we all recognize that a room at 65 degrees may be, so far as comfort is concerned, considerably cooler under certain conditions than it would be at the same temperature under other conditions. In the summer time we all use fans to keep cool. Not that the fan changes the room temperature one single degree, as measured by a thermometer, but because of the increased circulation of air and the consequent increase in the rate of evaporation from our bodies we feel cooler. Would not exactly the same thing hold true if a fan were permitted to increase the furnace air circulation when the air being circulated was not of sufficiently high temperature to be of heating value? We are very firmly of the opinion that induced circulation loses most of its advantages unless automatically controlled so that only air of heating value is positively delivered.

If induced circulation offers advantages, the fan must be so designed as to

lead itself to existing installation, as well as to new installations. The circulating instrument must be compact; the body must not offer interference to the free flow of air; the blades must not baffle circulation when the fan is idle; the motor must be totally inclosed to protect it from dust and dirt; oil reservoirs must be ample to perfectly lubricate the instrument over a reasonable period of time. And in order that existing furnace installations may be equipped, the installation must be simple and reasonable in price. The outfit should be so designed that it is not necessary to spend the customer's money in new boots or new piping, but can be easily mounted in existing cold air returns. By keeping the cost down, the market broadens in more than direct proportion.

Through induced circulation then we are able to assure positive circulation to all rooms in the house, regardless of weather conditions and to a certain extent, we can overcome handicaps or deficiencies in house construction that work against efficient and uniform circulation by gravity. Through induced circulation we are able to deliver the

additional volume of air that is necessary, if we are to reduce the yearly investment and maintenance cost of a warm air heating plant by materially increasing the years of its efficient service. Through induced circulation, we are able to deliver warm air at a considerably lower temperature than can be done by gravity and in so doing, we make available a portion of the much wanted humidity. And again, by thoroughly mixing the air because of increased velocity, we cut down the temperature difference between ceiling and floor levels. We decrease the fuel consumption, thereby more than providing for the initial cost and by thermostatically controlling the operation of the fan, we only use induced circulation when it should be used and never when it should not, all without the necessity of thought or action on the part of the house occupant.

I believe that the time is approaching when some system of induced circulation will be part of almost every warm air furnace installation. By its use, positive circulation can be assured to every room in a house and dealers delivered from troubles that have seemed

There are hundreds of thousands of buildings in this country that need some, or all of the various kinds of material that you sell. Even the house that was completed yesterday and the one to be completed next month is a prospect.

But what are they prospects for? The T.E.B. "Inspection Report" card herewith shown is the key to the above question. Therefore, have your journeymen turn one of these cards in on every building they do work in. By so doing they will build up a list of business prospects that will produce business when new business has slumped. Business slackness will come some time. Just when, we do not know, but this is a sure method of warding it off.

necessary evils, because heretofore they have been unable to remedy successfully poor circulation due to adverse winds or peculiarities of house construction and the consequent furnace installation and layout difficulties.

Is Not a Cure-All

Induced warm air circulation is not a

cure-all. It will not make satisfactory jobs that have been furnished with undersize furnaces, with poor installation work, or with insufficient cold air returns. But with the proper size furnace, fairly well installed and with proper sized pipes, it will overcome the bugbear of sluggish circulation.

Contracts Awarded

Haileybury, Ont.—A. Brazeau, Timmins, has been awarded the plumbing and heating contract on the new separate school being built here. He has also secured the plumbing and heating contracts on the new public school.

Three Rivers, P. Q.—Valere Garceau, 238 St. Julie, has the contract for plastering and plumbing of the kiln and heating system, costing \$75,000, for Hospital St. Joseph.

Toronto.—E. Lankin & Son, 56 Lippincott St., have the roofing contract for \$100,000 addition to Methodist Church on Danforth Ave.

Timmins, Ont.—The sheet metal work on the new \$20,000 High School is to be done by A. Brazeau.

Brockville, Ont.—The plumbing and heating contracts on the \$5,000 addition to the Brockville Recorder and Times Building have been secured by George Ross & Co.

Cornwall, Ont.—Arthur Robinault, Valleyfield, P.Q., has been awarded the contract for roofing in connection with the extension to paper mills of the Howard Smith Paper Mills Co.

Ridgeway, Ont.—The contract for plumbing in connection with the \$67,000 club house has been awarded to E. Cardwell, 32 Division St., Welland.

Three Rivers, P.Q.—Germain & Freres, St. Antoine St., have the contract for roofing, plumbing, and heating, in connection with the \$30,000 extension to factory on Bellefeuille St.

Waterloo, Ont.—Harvey Gleiser, King St., has the contract for heating and plumbing in connection with \$15,000 addition to factory owned by Bauer Bros.

Walkerville, Ont.—The contract for plumbing and heating in connection with \$7,000 factory for T. H. Taylor & Co., Chatham, Ont., has been let to N. Fielding, 40 Assumption St.

New Hamburg, Ont.—Geo. Steiner has the heating and plumbing contract for the \$12,000 residence being built for Miss L. Travers.

Ottawa.—Wm. Roy, Armstrong St., has the contract for plumbing and heating of the \$25,000 apartment house being erected on Wellington and Holland Aves., for William Joynt, Laurentian View.

Toronto.—A. B. Ormsby Co. have the roofing and sheet metal contracts for the \$175,000 office building for the Canada Life Assurance Bldg., Gerrard and Yonge Sts.

Ford, Ont.—The Ford City Plumbing & Heating Co. have the plumbing and heating contracts for \$15,000 residence being built on Sandwich St. for Joe L. Reaume.

Windsor, Ont.—Chas. W. Jessop, 619 London St. W., has the plumbing contract on \$7,000 garage being erected on Church St., for E. P. Holden.

Dorval, P.Q.—John Gordon has the plumbing and heating contracts for the \$25,000 addition to the residence of J. W. McConnell.

Gaspe, P.Q.—J. H. Paquet, 30 Dalhousie St., Quebec, has the plumbing contract for the \$30,000 addition to the bishop's residence.

Oakville, Ont.—W. Whitaker, Jr., has the heating and plumbing contracts on \$11,000 residence being built on First St., for E. D. Wilkes.

Ottawa.—E. Monette has the heating and plumbing contracts on \$10,000 duplex residence on McLeod St., owner, C. Armstrong.

Toronto.—F. O. Swan, 1962 Gerrard St. E., has the plumbing contract and Pollard & Dilks, 54 Gledhill Ave., the heating contract on three pair residences, \$18,000, being built by Woodhouse & Dickinson, on Milverton Blvd.

Quebec, P.Q.—The general contract for the heating system for St. Malo School has been awarded to Fortunate Gingras, 34 St. Augustin St.

Truro, N.S.—F. Dexter & Co., 594 Prince St., have the contracts for plumbing and heating for the \$9,000 rectory being built for St. John's Anglican Church.

Vancouver.—Barr & Anderson, 1060 Homer St., have secured the plumbing and heating contracts for the \$32,000 Infants' Dormitory for the Children's Aid Society.

Wolfville, N.S.—H. G. Hagen & Co., Halifax, have been awarded the plumbing and heating contracts for the \$350,000 auditorium and lecture rooms for Acadia University.

Mimico, Ont.—J. H. Doughty has been awarded the roofing, sheet metal, plumbing and heating contracts on \$20,000 branch of the Bank of Montreal.

Ridgeway, Ont.—W. E. Wilkinson, Bridgeburg, Ont., had the contract for plumbing and heating for \$67,000 club house.

Egmont Bay, P.E.I.—Thos. Johnston & Co., Ltd., Summerside, have the contract for heating of \$30,000 church being built for the R.C. parish.

Giffard, P.Q.—Fortunate Gingras has been awarded the plumbing and heating contract on the new \$39,000 school.

Giffard, P.Q.—J. Careau has been awarded the plumbing and heating contract on the \$55,000 boarding school being built for Rev. Sisters Oblates.

Toronto.—I. Maude, 18 Rowland Ave., has the plumbing contract and J. A. Pountney, MacKay Ave., the heating contract on \$18,000 residence and garage on Austin Terrace and Lyndhurst.

Heating Engineer Out to Make November a Record for Business

B. J. Shea, Veteran Heating Engineer of Fredericton, N.B., Employs Progressive Methods—Circularizes House Owners on Value of Good Heating

THE fall months are the logical months to campaign for heating business, including installations and repairs, in the opinion of D. J. Shea, of Fredericton, N. B. Mr. Shea is one of the veterans of the plumbing and heating trade of Eastern Canada. He was operating his business when some of the younger contractors were on the business end of a milk bottle. And yet he has not lost interest in his business. Nor could he be styled a reactionary. In fact he is a progressive, and keeps busy evolving new ideas that will help business.

For instance, he is now in the throes of a drive to make November a big month for heating. In this connection he has prepared a bulletin which he has had printed and distributed to house owners, in and about Fredericton. The bulletin is worded as follows:

The important matter of heating should not be left until the temperature is away down.

Much better to take time by the forelock and have the necessary work done now.

Setting up new furnaces, repairing old ones, installing and repairing steam and hot water heating systems is part of our business.

We are prepared to give all orders prompt attention, having a large staff of workmen ready.

It will be noticed that there is an entire absence of long words. Mr. Shea is a firm believer in appealing to the public, in simple and direct language. He believes that the stilted language of some advertisers, travels right over the heads of those whose attention is sought. He is also a firm believer in the advisability of a plumbing and heating engineer writing his own advertising in most instances. "Keeping everlastingly at it," is the slogan of the Shea business, and that it has been successfully applied, is proven by the importance of this business.

Tinsmithing and Sheet Metal Work

Tapering Elbows Which are to Correspond with Measurements of Special Nature Can be Laid Out by Sweep Method

This Plan Permits Designer to See Definitely Just What He is Going to Have When Pattern is Complete

Written for Sanitary Engineer by O. W. KOTHE, Principal, St. Louis Technical Institute

RESPONDING to an inquiry for a tapering elbow, will say the accompanying drawing will satisfy the solution.

There are several methods of approaching such a development, but the writer believes the method outlined serves the purpose better, in that it enables a person to see definitely what he is going to have. It also allows fitting such an elbow in definite measurements; and should the distance X be longer or shorter than Y, proper disposition can be made, so that the elbow will fit in the given measurements.

Procedure in Laying Out Pattern

The secret of this method is to consider the elbow in the first place as a common straight elbow, where the joints can be made reversible into a straight cylinder. Inside of this, we build our taper elbow, working from centre measurements as lines X and Y. This will establish the vertex W, from which the arc a-f is described, and the arc divided to make a 5-piece elbow. Thus: $5 \times 2 = 10$ minus $2 = 8$ spaces for the quadrant.

This is the same as for any ordinary elbow, and we then draw miter lines from W through points b-c-d-e. We then work from the large end of elbow 1-7 and square up lines as 1A and 7-B. If we wish to see how the elbow will look and the position it takes, we can complete the straight elevation of elbow, as the dotted lines show. Then to fill in the taper, we take the half diameter a-a' and set it as f-a on the base of the large end, and divide the remaining space into five equal parts or as many as we have parts in the elbow. This is the equalization scale, and with dividers we pick the distances as f-b, f-c, f-d, f-e, and set them as b-b', b'', c-c', c'', d-d', d'', e-e', e'', which allows drawing the taper lines and will centrally locate the taper in the elbow of the dotted position.

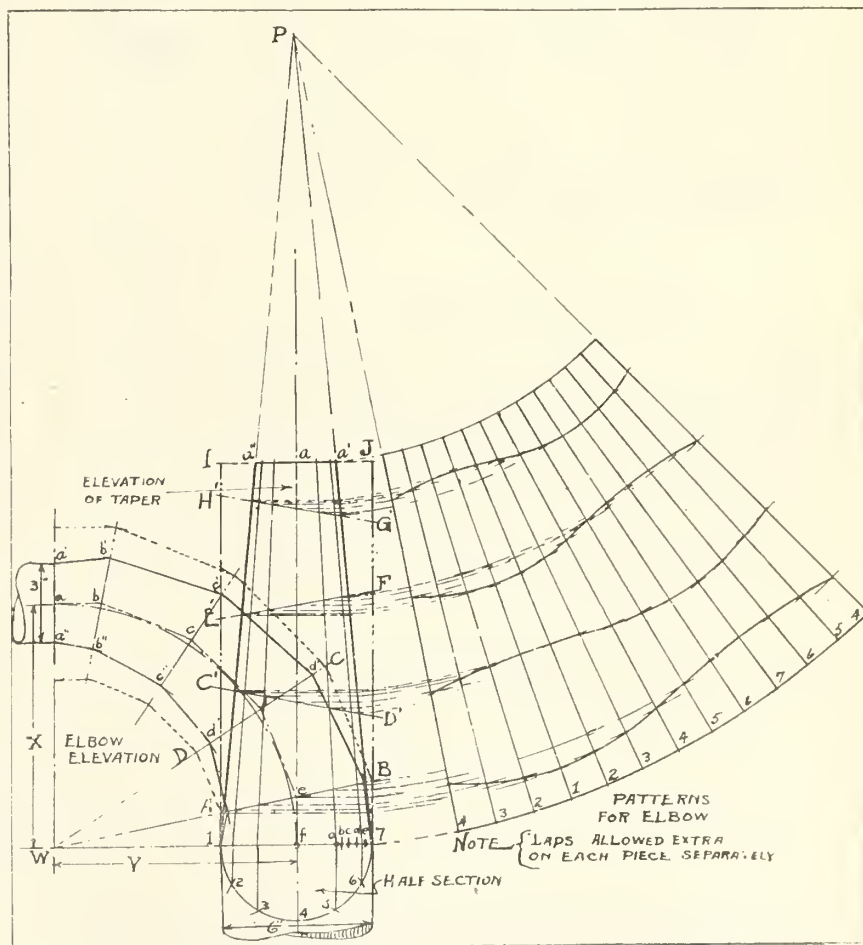

We have here an elbow to fit in a given position to correspond with measurements that may be of a special nature. From this elevation, we then construct our elevation of taper; that is, we straighten out our elbow into a straight

pipe, and draw the taper on the inside. So we pick the heel and throat lines from the straight elbow of the dotted position, as B-C and A-D, and set them as A'-C' and B-D'; also continue the process and duplicate the pieces as C'-E', D'-F', F'-G', E'-H', G'-J', H'-I'. This allows drawing the miter lines in the straightened out elevation, such as a reversible elbow would have in a similar position. On the inside we draw the taper, measuring off the diameter, as a-a'-a'', and then draw the side lines, extending them to the apex P.

Next, describe the half section for the large base, and divide in any number of equal spaces, as from 1 to 7, and square the lines up to the base 1-7, and from here taper them to the apex P, so as to cut the miter lines as shown. A nail can be driven in the apex P and this facilitates drawing the radial lines, by laying the straightedge up against the nail.

Now, since only the outside lines of the taper are true lengths, and all the inside lines are foreshortened, we, therefore, project lines from each point in the miter lines to the outside slant, as a'-7, which places all of these points in the miter lines in a true length position, and enables sweeping out the pattern. The pattern is then swept out as we show it; and no comment is needed on this procedure since it is the same as describing a taper joint of pipe, or a flaring pan or funnel. Care must be taken when placing the seams on the sides, as we show them, that the heel and throats have a proper relation in the flat, otherwise it is easy to overlay them

Armistice Day Observances

ONCE again the anniversary of Armistice Day has come and gone, attended by celebrations of jubilation and the services in memory of the fallen that have marked the date each year since the closing of the war. Fit and proper are these observances, but there is another angle to the day which should be given even more consideration than these, worthy though they are.

Armistice Day saw the close of a great war, waged for the purpose of making a better civilization. Canadian men fought and died that this aim might be achieved, but it can be achieved only by the honest and earnest endeavors of every citizen, at all times, in peace or in war.

With each individual to-day rests a duty just as serious as that which faced them in war days. A better Canada and a better civilization is only possible if each person orders his life so as to help make them so. Armistice Day should be a day of thought and of soul-searching, a day when the individual turns his consideration to what he is doing for the good of his country and for his fellow man—what he is doing to carry on the work so nobly undertaken by the sixty-five thousand of his fellow citizens who gave their lives in France and Flanders, and by the several hundred thousand others who offered theirs just as freely.

Dirtless Plumbing

A RECENT tendency has been noted in the trade toward a greater care in the household in doing the work necessary for plumbing and heating installations or repairs. This is probably a somewhat natural development following upon the era of keen competition for business. When business reaches such a competitive stage as has been felt recently the most marked progress is always noted along certain lines. It becomes a survival of the fittest and everyone endeavors to do things sufficiently better than the other fellow to justify his getting the business. Whether or not this natural tendency is at the root of the present movement, it is a development which should be continued and broadened in its application to the plumbing and heating industry.

Much of the average housewife's attitude of necessary tolerance toward the plumber would be removed by greater care on the plumber's part in regard to his own personal appearance, the way he conducts himself while in the house and the way in which he handles household effects with which he is in contact. No one expects a plumber to come in a plug hat and a starch front shirt; he is expected to be attired in clothing suitable to the class of work in which he is engaged, but there is a wide latitude even here. When the plumber's appearance is such as to engender in the housewife's mind a fear that her home will be unnecessarily dirtied

by his work, the gap between the customer and the plumber is further widened.

One or two plumbing and heating contractors have recently been making a big bid for business featuring their "dirtless workmen," and they have been having good success. The business secured by replacing equipment in buildings already constructed is becoming so important in both plumbing and heating that it must be given attention. If the work to be done in such cases is executed with a minimum of dirt and inconvenience to the occupants, the owner will be favorably impressed, less likely to oppose further plumbing and heating improvements in future, and more likely to get the same plumber to do the work than to go elsewhere. From every standpoint it is a sound proposition, takes no more time of workmen, and, if widely adopted, will result in considerably raising the appreciation of the average home owner for the plumber and heating engineer.

No Machinery Men Are Cheap

THE plumbing and heating industry is one which has benefited very largely from the introduction of modern machinery. To a greater extent than it commonly appreciated this industry has been assisted toward more rapid development by the use of machinery in factories and even in the operators' workshops. A question has been asked as to whether the further use of machine methods would result in any greater efficiency and consequent lowering of costs in this industry. Having this point in mind and the tendency among certain classes of workers to oppose the introduction of any machine methods which might cut down the number of men employed, the recent remarks of Samuel Gompers, before the American Federation of Labor, are of interest.

"Accept the machine, organize the workers," said Samuel Gompers. Resistance against new machinery was useless, he said. "I am free to say that from that time there came some light to my mind, and I realized then for the first time that it was absolutely futile for workmen to protest against or go on strike against the introduction of a new machine, a new device or a new tool.

"In the old time when the cotton spinning jenny was introduced and the machine put into the textile plants, the men in the industry, enraged at seeing their trade taken away from them, a trade they had to serve several years to acquire, destroyed the machine. Was the machine destroyed? Yes, but was the idea destroyed? No. The blue prints were in existence for that machine, and in any event the scheme and the plan were in the mind of some one who had burned the midnight oil. The machines in the textile industry became universal in every modern country.

"The conditions of the textile workers are not what they ought to be by any means, but were the conditions of old, when the men worked by hand, better than those that now prevail? By no means. The hours of labor were from sun up to sun down.

"The water carriers of Egypt protested when pipe lines were being laid to carry water to some central parts of the cities, because it did away with their trade of carrying water. The rickshaw runners of China raised a revolution because horses were put to wagons to carry people. In some of our cities hack drivers protested against the erection of railroad stations because it took away their jobs.

"Some years ago I had occasion to travel in the southern states, and there I saw, in the middle of the rivers, colored men who were dredging with buckets and long poles. They were getting 20 to 30 cents a day. Wherever men are cheap no machinery is used in industry or any other way. It is only when men are dear and wages are high that machinery is brought in."

Average Expense of Specialty Trades

THE Harvard Bureau of Business Research supplies the following figures for specialty stores in 1922, a survey of which field it has just completed:

	Pct.
Salaries and wages	15.2
Rentals	3.3
Advertising	3.4
Taxes, except income and building	0.3
Interest on owned and borrowed capital	1.8
Supplies	1.1
Light, heat, power, delivered.	1.0
Unclassified	1.0
Travelling	0.6
Communication	0.3
Repairs, except to building	0.3
Insurance, except on building	0.3
Bad debt losses	0.2
Depreciation, except on bldg.....	0.7
Professional services	0.2
Total expenses	29.4
Net profit	2.5
Gross margin	31.9

THERE are a number of notations to be made in connection with the foregoing. One of them is that they are not average figures, but the figures selected as the most common or usual for each of the items. Therefore, the addition of (most usual) items does not necessarily give the figure for (most usual) total expense.

THE figures were collected from reports of thirty-one shops, eight of them doing less than \$250,000 a year, six from \$250,000 to \$199,000, four from \$500,000 to \$999,000, nine from \$1,000,000 to \$3,999,000 and two from \$4,000,000 to \$9,999,000 and two doing a business of more than \$10,000,000.

NO CLASSIFICATION of salaries and wages by functional groups was made, but it was noted that administrative and executive salaries and wages ran higher in specialty shops than department stores.

BUYING salaries and wages appeared also to be slightly higher, but direct selling salaries and wages ran considerably lower in percentages of net sales in specialty shops than in department stores.

TOTAL publicity and buying expense appears to be higher than in department stores (this means the inclusion of salaries, etc., which are not included in the figures given in the foregoing table).

OF SEVENTEEN shops reporting on the point, 8.8 per cent. of gross sales appeared to be the typical figure for returns and allowances, though the range was from a low of 5 per cent. to a high of 20 per cent.

THE usual figure for stock-turn was 4.3 times a year.

How Big is Your Store?

Minute Message No. 37

Written for Sanitary Engineer by FRANK STOCKDALE

Profit Figuring Series

THE illustration above shows the profits and losses by lines in a shop which carries thirty-one different lines of goods.

Only eight of the thirty-one lines really lost enough money to be considered profit losers.

Ten other lines, however, either made a very small profit or a very small loss. To save confusion we say the plumber breaks even on these ten lines.

This leaves thirteen profit makers as against eight profit losers. These eight losing lines consumed the profits of the eight profit making lines selected from the thirteen "white" lines.

This plumber, therefore, has the net profits on five lines as his total for the year. In other words he realized one-sixth of the profit he might have made from a business where all lines were profit makers.

How big is your shop?

It's just as big as the profits it produces.

It pays to know the profits and losses on each line of goods carried.

News Notes From Coast to Coast

Doings in the Plumbing and Heating Industry

BUSINESS CHANGES

George A. McLaughlin, Blyth, Ont., has disposed of his plumbing business to Colin Finland.

INCORPORATIONS

Incorporation has been granted to the American Plumbing Supplies, Ltd., to manufacture, wholesale, job and retail plumbing supplies. The head office of the firm will be in Montreal. Capital \$75,000.

OBITUARY

Edmonton.—News has been received in the city of the sudden death at Victoria, B. C., of John C. Wilcox, general manager of Carroll & Wilson, plumbing supply dealers of this city. The remains were taken to Toronto for burial. Previous to coming here ten years ago, the deceased was in the employ of Cluff Bros., Toronto.

FIRM GETS BIG ORDER

Sarnia, Ont.—Announcement has been made of a contract between the Canadian Products Company, a division of the General Motors of Canada, and the H. Mueller Mfg. Co., whereby the latter becomes the sole source of supply for brass parts required in the production of McLaughlin cars during the coming year. This material has heretofore been largely purchased in the United States.

WILL VOTE ON SEWER QUESTION

Toronto.—Although York Township passed a by-law for the establishment of sewers, sewage disposal plants and equipment in Todmorden, Greenwood, Eaton and Muriel Ave. districts, it is understood that many of the ratepayers do not want the sewers installed at present, owing to heavy taxes caused by recently installed sidewalks and other local improvements. It is expected that the question will now be put to a vote of the ratepayers at New Years.

PLUMBERS VIOLATE TRUST LAWS

Washington, D. C.—Fines aggregating \$20,000 have been imposed by the Federal Courts in Chicago upon 16 plumbing and heating companies of the Middle West for alleged violation of the Sherman Anti-Trust Act. The indictments against the firms charged the defendants with having conspired to fix and maintain uniform and non-competitive prices for plumbing and heating apparatus and fixtures sold to retail dealers and master plumbers in several states of the Middle West.

PERSONAL

Major L. L. Anthes is in New York, where he will attend the executive meeting of the American Foundrymen's Association, of which executive he is a member, later proceeding to Baltimore to attend the annual dinner of the National Founders' Association.

NEW BUILDING FOR HOSPITAL

Winnipeg.—A new building is being erected in connection with Grace Hospital. It will cost approximately \$70,000 and will be used as a heating plant, power house and laundry. Plans are also under way for a new wing to the hospital proper, to be built in 1924, at an estimated cost of \$130,000.

TO AMALGAMATE CIVIC SERVICES

Winnipeg.—Amalgamation of the city engineers, waterworks, plumbing and sewer, street commissioner's, and all other operating and construction departments, outside the hydro, is the proposal of the civic department amalgamation committee, appointed to investigate the possibility of eliminating overlapping and duplication of effort in the civic departments.

EXPORT DEMAND INCREASING

Brantford, Ont.—The Williams Tool Corporation report an improvement in export demand. Through Cranes, Ltd., they recently sold, for an account in India, two machines, one a 20-inch and the other a 6-inch. The machines had to be packed in sections for carriage by mules into the interior of India. A third machine, a 6-inch, was shipped recently to a point in South America for the Imperial Oil Co.

WILL MAKE SANITATION CENSUS

Regina.—Prompted by the city commissioners, officials of the building inspector's department and the health department are to conduct a survey of the city to determine how many houses now on the city water and sewer lines are without connection to those two services, contrary to civic by-law. Further than that, they are to estimate the cost of the installation of the necessary fixtures to make such houses come within the accepted meaning of the term "modern." It is estimated that there are 900 houses in the city not connected with these services.

BUILD DORMITORY AT R.M.C.

Kingston, Ont.—The contract for the erection of the new Royal Military College dormitory building has been awarded to H. W. Watts, Kingston. Simmons Bros. have the plumbing, heating and tinsmithing; T. Milo, painting and glazing; S. Anglin & Co., woodwork; J. Harris, electric wiring. The cost of the building is placed at \$103,000.

SEWERS OR SEPTIC TANKS?

Toronto.—Sewer connections versus septic tanks is a live question in the western suburbs, in doubt as to where they stand on the possibility of being annexed to the city of Toronto. Humbercrest school, 600 yards outside the city limits, is hesitating before investing money in septic tanks, to see if there is a possibility of securing sewer connections from the city or of being annexed and included in the city's system, while other districts find themselves in somewhat similar positions.

FEW CHANGES WANTED IN BY-LAWS

Windsor, Ont.—Master and journey-men plumbers of this city, who met recently with the finance committee to discuss the plumbing by-law, approved of the by-law with very few exceptions. A few minor changes were submitted and referred to Plumbing Inspector Newitt for report. The plumbers also submitted clauses calling for a year's residence and a license fee before a plumber could be permitted to do work. These, too, will be considered by the finance committee.

TENDERS WANTED

Ottawa, Ont.—Heating and plumbing tenders are being received by J. E. Poirer, 440 Clarence St., in connection with \$18,202 addition to chemical laboratory.

Point Grey, B.C.—Sharp & Thompson, 708 London Bldg., Vancouver, are preparing plans for \$250,000 central heating plant on University Campus, and tenders will be called shortly.

Montreal.—Ventilating, roofing, plumbing and heating tenders are being called for in connection with \$90,000 hospital at 121 St. Hubert St. The architect is J. E. C. Daoust, 180 St. James St.

Toronto.—Roofing, heating and plumbing tenders are being called for \$100,000 manufacturing building being erected at Spadina Ave. and Phoebe St. for Empire Clothing Co. B. Brown, 287 Spadina Ave., is the contractor.

Cannington, Ont.—Heating and plumbing tenders are being called for in connection with the \$18,000 residence being erected for N. D. McKinnon. J. Hunt

Stanford & Son, 67 Yonge St. Arcade, Toronto, are the architects.

Toronto.—Plumbing tenders are being called for by S. H. Lumb, 31 Oakdene Crescent, owner and builder of four stores and apartments being built on Danforth Ave.

Montreal.—Plumbing and heating tenders are being called for in connection with six residences and four garages, \$50,000, on Van Horne. Guidazio & Besozzi, 640 De L'Epee Ave., are the owners and builders. They also are building \$100,000 apartment house in Outremont on which plumbing and heating contracts are still to be let.

Toronto.—Plumbing and heating contracts are still to be let on two residences, \$20,000, on Springmount Rd. J. Hunt Stanford, 67 Yonge St. Arcade, is the architect.

Mount Royal, P.Q.—Bremner Norris & Co., general contractors, have the letting of plumbing and heating contracts on \$12,000 church hall for Church of England.

Waterville, N.S.—J. H. Hicks & Co., general contractors, have the letting of roofing and plumbing contracts for \$13,000 church for Methodist and Presbyterian Union.

Kitchener, Ont.—Bacher & Hauch, 37 Queen St. S., are owners and builders of \$10,000 residence, Maynard & Margaret Aves. They are receiving tenders on heating, plumbing and electric.

Montreal.—M. Bernstein, 591st St. Catherine St. W., is owner and builder of \$16,000 residence on Grand Blvd. He is receiving tenders for roofing, plumbing and heating.

Montreal.—All sub-trades are still to be let on \$45,000 residence on Sherbrooke. N. Shribman, 5056 Sherbrooke St. W., owner and builder.

Montreal.—Roofing, plumbing and heating contracts are still to be let for \$15,000 residence being built on Sherbrooke St. by A. Letourneaux.

Montreal.—All sub-trades are still to be let on \$12,000 residence on Laurier Ave. T. Pilotte, owner and builder.

Montreal.—Roofing, plumbing and heating contracts are still to be let on four residences being built on Patricia by J. S. Brown, 324 Patricia.

CONTRACTS AWARDED

Toronto.—H. Griffiths & Co., 1128 College St., has the plumbing contract for \$12,000 annex to sub-station, Duncan and Nelson Sts., for Toronto Electric Commissioners.

Toronto.—W. A. Brown, 331 Georgia St., has the plumbing contract and Walker, Leek & Co., 1090 Homer St., the heating contract on the \$60,000 apartment block being built at 12th Ave. and Alder St., for Wm. Walker & Co.

Brampton, Ont.—Higgins & Large have the heating and plumbing contract for the new \$12,500 telephone exchange.

Toronto.—A. T. Steven, 516 Yonge St., has the plumbing contract and Howard Furnace Co., the heating contract, on seven residences, \$6,000 each, on Strathmore, near Woodmount Rd.

Corbyville, Ont.—John Lewis & Co., Belleville, have the plumbing and heating contracts on the \$225,000 distillery buildings for the Canadian Industrial Alcohol Co.

HE GOT IT

A ten-year-old boy entered one of the banks of a thriving town and walked up to the cashier.

"Mister," he said, "I want a check book for a lady that folds in the middle."

IN CITY LIMITS

A Chicago man, while in New York, was requested by a long-distance telephone operator to deposit 25 cents for telephoning to a certain place. He objected.

"Why, in Chicago we can telephone to H--- for a quarter."

"Yes, but that's in your city limits," was the girl's answer.

TRYING FOR BOTH

A very homely Irishman had lost his job and was having a hard time finding another when an acquaintance met him one day.

"Hello, Pat! How are ye?" he said.

"Mighty bad," was Pat's reply. "Sure 'tis starvation that's starin' me in the face."

"Is that so?" the other rejoined. "Sure it can't be very pleasant for ayther av ye."

DESERTEd BUT NOT QUITE ALONE

"Yes, your honor," the aggrieved wife explained, dabbing her eyes, "my husband neglects me shamefully; he's never at home."

"Hum!" the judge pondered. "And how about you—do you spend your evenings all by yourself, with no companionship whatever?"

"We-w-well," she sobbed, "I—I have two goldfish."

FATHER'S FAULT

Father had a nasty temper at times. One night his small boy was sitting by him, studying arithmetic. The father broke out:

"What on earth ails you? Why can't you sit still—wriggling and writhing every minute?"

"It's all your fault," blubbered the boy. "Why?"

"'Cos I asked you last night how much a billion was, and you said 'a deuce of a lot!' The teacher asked me the same question to-day and I said the same thing. And that's why I can't keep still."

LAYING A TRAP

A British tar, home on leave and celebrating the occasion, had got himself into a dilemma. He had hired a taxi, only to discover when approaching his destination that he was penniless. He had dined and wine, not wisely, but too well. But the British navy is a training school of resourcefulness. He caught up the speaking tube, shouted "Stop!" and jumped out.

"I just want to pop into this tobacconist's and get some matches," he explained to the driver. "I've dropped a pound note somewhere in the cab and can't find it in the dark." He entered the tobacconist's and as he did so the cab and its driver vanished into the night, as he had anticipated.

FOR EX-SERVICE MEN ONLY

On the other hand, there is the story of the dusky lady, narrated by Mac in the Rock Island Argus, who went into a drug-store and asked for one cent's worth of insect powder.

"But that isn't enough to wrap up," objected the drug clerk.

"Man," exclaimed the dark lady, "I ain't asked you to wrap it up. Jes' blow it down my back."

RAPID MULTIPLIERS

A little boy was overheard saying to his pet rabbit:—

"How much is seven times seven?"

There being no response from the rabbit, the boy said:

"How much is four times four?"

Still there was no response.

"Now I will give you an easy one. How much is two times two?"

Still the rabbit refused to respond.

"Well, said the boy, 'I knew father was fibbing when he said rabbits are the greatest multipliers in the world.'"

THE APPEARANCE OF EVIL

"Sister Henderson," said Deacon Hypers, "you should avoid even the appearance of evil."

"Why, Deacon, what do you mean?" asked Sister Henderson.

"I observe that on your sideboard you have several cut glass decanters and that each of them is half filled with what appears to be ardent spirits."

"Well, now, Deacon; it isn't anything of the kind. The bottles look so pretty on the sideboard that I just filled them halfway with some floor stain and furniture polish, just for appearance."

"That's why I'm cautioning you, sister," replied the Deacon. "Feeling a trifle weak and faint, I helped myself to a dose from the big bottle in the middle."—Exchange.

COPY OF CARD GIVEN TO MOTORISTS IN KOBE, JAPAN

At the rise of the hand of the policeman, stop rapidly. Do not pass him by or otherwise disregard him.

When a passenger of the foot hove in sight, tootle the horn, trumpet to him melodiously at first. If he still obstacles your passage, tootle him with vigor, and express by word of mouth the warning, Hey, Hey.

Beware of the wandering horse that he shall not take fright as you pass him. Do not explode the exhaust box at him. Go smoothly by or stop by the road side until he pass away.

Give path space to the festive dog that make sport in the roadway. Avoid entanglement of dog with your wheel spokes.

Go smoothly in the grease-mud, as there lurk the skid demon. Press the brake of the foot as you roll round the corners to save the collapse and tie-up.

WINDOWS OVERCOME PROBLEM

(Continued from page 18)

Secure two coal scuttles of noticeable difference in size. Fill each scuttle full of coal with plenty piled on top. Place your display board on the centre pedestal, so braced from the rear that it will stand erect. Place the large coal scuttle on the pedestal on one side, and the small coal scuttle on the pedestal on the other side of the window.

With the photograph and the foregoing description, any heating contractor should have little difficulty in building an effective display based on this idea.

Portable Pipe Cutting and Threading Machine Placed on the Market

New Device Designed to Fill the Gap Between the Heavy, Immobile Power Machine and Light Hand Equipment—Weights Less Than 500 Pounds

A NEW machine to meet a long-felt want in the pipe cutting and threading field, has been placed on the market by the Williams Tool Corporation, of Brantford. This machine has been designed to fill the gap that has long existed between the heavy and immobile power machine and the light hand threading and cutting equipment. It is called a Portable Pipe Cutting, Threading and Reaming Machine.

The manufacturers point out that the machine weighs less than 500 pounds and may be dismantled in less than three minutes, and there is every indication that it will have an extensive sale to steamfitters, manufacturers and engineering concerns who do not require the heavy machine but have found their equipment inadequate for rapid and efficient service.

Portable and Demountable

It is perfectly designed, for weight and strength, to cut smooth and clean threads, either right or left hand, within

its capacity, and can be dismantled in two minutes and fifteen seconds.

The small oil trough or cutting box under the carriage lifts off, allowing the carriage and head to slide off the round ways, and by releasing two screws the Shelby tube steel ways can be pulled out of the head stock, thus leaving only the pedestal and head stock as a unit which two men can easily lift.

Its capacity is as follows: Threading, pipe, $\frac{1}{4}$ to 2 in. inclusive, bolts $\frac{3}{8}$ to $1\frac{1}{4}$ in.; cut-off, pipe or tubes $\frac{1}{4}$ to 2 in. inclusive, bolts and rods $\frac{3}{8}$ to $1\frac{1}{2}$ in.; reaming inside or chamfering outside, pipe or tubes $\frac{1}{4}$ to 2 in.; longest running thread at one chucking $10\frac{1}{2}$ in.

Motor Belt and Hand Driven

The machine is driven by a standard $\frac{3}{4}$ -h.p. motor by means of belt from motor to drive pulley enclosed in the base of machine and mounted on a hinged table which allows tightening of the belt instantly by screwing down on a thumb screw. Current is supplied

from an ordinary lamp socket through a standard cord with push socket. A button control switch for start and stop is mounted on the machine at the operator's left hand.

Since the drive from motor to machine is through a belt, this insures protection to the dies and other working parts should excessive strain be placed on any part of the machine. The slippage of belt in this case would act as a safety factor.

The machine can be converted to belt drive by simply taking off the motor belt and driving from a line or counter-shaft.

Provision has also been made to operate the machine by hand. To do so, it is only necessary to shift gears to neutral position when the crank handle can be fitted on to the worm shaft which is directly connected to the spindle through worm and worm wheel.

Two Speeds

The spindle has two speeds arranged similar to automobile sliding gear, which

Two views of the portable pipe cutting, threading and reaming machine placed on the market by the Williams Tool Corporation, of Brantford.

also gives a neutral position for the purpose of starting and stopping spindle without shutting off current. It is operated by small knurled push button at operator's left hand.

All gears are made of steel, machine cut. Sliding gear driven by standard Woodruff keys. The drive to spindle is through a quadruple worm and worm wheel with ball thrust. All gears and worm are lubricated by oil from a special oil sump.

All bearings in the machine are equipped with standard Bunting bronze bushings, lubricated from a special oil sump. The driving shaft has three bearings and the worm shaft two.

The spindle is made of standard Shelby steel tubing, extra heavy, and has a bore of $2\frac{7}{8}$ in. which allows a 2-in. coupling to pass through. The spindle rests in a box type head stock which has wide face bearings lubricated by splash system from special oil sump.

The front gripping or driving chuck is Williams standard three-jaw universal self centring. The chuck worm and worm wheel are steel packed in grease, while the chuck jaws are tool steel tempered. On the rear of the spindle is a standard Williams three-jaw self-centring scroll chuck for centring long lengths of pipe and operated by a hand wheel.

The carriage ways on which the carriage slides are standard Shelby steel tubing, extra heavy, accurately sized to one-thousandth part of an inch and highly polished, thus insuring a long wearing surface.

Die Head

The die head and carriage are cast in one piece, thus eliminating any possible chance of the head getting out of alignment. The part of the carriage resting on the Shelby tube ways is babbitted with extra hard babbitt.

The carriage has six bearing parts on the ways, three on each side. This makes it possible for the carriage to be re-babbitted and lined up at little expense after years of hard usage. Operation of head and setting of dies is very much similar to that used on all the standard machines.

The dies are operated by cam and lever and are interchangeable, adjusted to all variations of fittings. A graduated die head makes unnecessary the use of blank gauges for setting the dies. Whenever several pieces of the same size pipe are to be cut, a cam stop is used to stop the cam lever at the right place for that particular size.

Three sets of dies are furnished with the machine as standard equipment, one set cutting $\frac{1}{4}$ and $\frac{3}{8}$, one set $\frac{1}{2}$ and $\frac{3}{4}$, and one set 1 to 2 in.

To change the dies it is only necessary to slack off two nuts on the face of the die head, when the die plate can be shifted a fraction and lifted right away from the head.

Cut Off and Ream

The cut-off attachment is mounted on the rear of the die head and is operated

by a screw and hand wheel. A quick-operated V slide steadies pipe when cutting off. The V slide is equipped with hardened tool steel facings insuring a lasting wearing surface on the steady rest. This enables the operator to cut all sizes of pipe and bolts as required.

The blade is double bevel high-speed, set at an angle, which means that the machine can be run at its highest speed for all cutting-off purposes.

On the cutting-off attachment is pivoted the reamer holder operated by a lever. It is so arranged that all sizes of pipe can be reamed inside, or if necessary a slight chamfer can be made on the outside.

The tool bit used for this purpose is $\frac{3}{8}$ in. square, the same as used in any standard tool holder.

A Brown & Sharpe rotary geared oil pump is located on the rear side of the machine near the driving pulley. It is gear driven direct from the intermediate shaft. All gears are enclosed in a gear case. The oil is pumped from the reservoir in the base of the machine through a specially constructed strainer to the pump. From there it is forced through a flexible hose to the die head, thus insuring an ample supply of cutting oil to the dies and cut-off tool when operating.

A small independent valve is provided for each operation.

After flushing the dies and cut-off tool, the oil drains back into the small oil pan under die head. Before leaving the pan it is strained, after which it flows back into the reservoir and is used over continuously. But each time it must pass through the strainer in the oil pan, and the fine strainer on the end of the suction pipe eliminates any possible chance of grit or dirt getting into the pump.

A special die cabinet is cast in the top of the pedestal, providing a safe and

convenient place to store dies as well as any small tools used on the machine.

Each part used on the machine has been manufactured from specially designed jigs and fixture, which insure all parts being accurately machined and interchangeable.

Emery Wheel Special Feature

An outstanding feature of this portable threading machine is a high-speed emery wheel which is driven from a pulley shaft at the back of the machine.

Every user of a pipe machine has long felt the want of a small emery stone, for in every shop there comes a time when it is necessary to touch up a die, sharpen a chisel or take a burr off some tool, and in designing this portable pipe machine, the manufacturers had in mind the purchasers' requirements in this connection as well as a high-class pipe machine.

This emery wheel is driven from the pulley shaft at approximately 1,000 r.p.m. and the machine is so designed that when the operator desires to use the emery stone the gears on this shaft can be thrown into neutral and no other part of the machine is running except the motor and emery wheel, which allows him full use of the motor horse power for grinding purposes.

Of Norton Manufacture

The stone is of Norton manufacture, $5\frac{3}{4}$ in. diameter, $\frac{3}{4}$ in. face and proper grade for general grinding purposes. The shaft carrying the stone is of extra large diameter and equipped with three Bunting bronze bushings, with all the bearings running in oil.

A vertical car wheel lathe

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

H EATING lines during the past two weeks have been well to the front, and much work is still to be done in this branch of the trade. During the more seasonable weather that has been experienced of late, many furnaces and heating plants have been started for the first time this fall, and in many cases, it has been found that repairs were required, with the result that much repair work is in progress.

In Montreal considerable price cutting, in certain plumbing lines, is going on at the present time. 30-gallon range boilers being one of these lines, and

a cut of almost 10 per cent. being made in soil pipe and fittings.

Stronger tendencies are noticeable in lead and solder lines; candle wick, with some lines of pipe-cutters and galvanized sheets have advanced in price, while easier prices are noted on mica, and copper and brass sheets, rods and tubing. Pig iron has declined \$1 per ton. Ingot metal prices, especially tin and lead, are stronger, with a better condition existing in copper.

Collections show a slow but steady tendency towards improvement.

Montreal Markets

MONTREAL, Nov. 13.—Local dealers and jobbers report that business has been very active during the past two weeks in all seasonable lines, with a noticeable activity in heating equipment.

Prices on range boilers are steady, with the exception of the 30-gallon size, which is now being quoted at lower figures. Lower prices are now in effect on soil pipe and fittings. Slightly higher prices are effective on solder. The scrap metal market is reported by dealers to be very quiet, with prices at extremely low levels.

The ingot metal market shows a somewhat improved tone this week, especially in tin, which has developed some strength. The situation generally is quite favorable and higher prices in most lines would not be surprising.

PRICES ON RANGE BOILERS REMAIN FAIRLY STEADY

Montreal.

Prices on range boilers remain steady at figures issued two weeks ago, with the exception of the 30 gallon size, which is now being quoted at \$8.75 net. Lists and discounts prevailing locally are given herewith:

RANGE BOILERS—

5 Gallon	\$13 50
12 "	14 00
18 "	15 00

168 "	187 00
192 "	210 00

Discount Standard, 45 per cent.; Extra heavy, 40 per cent.

LEAD AND ZINC GOODS SELLING SEASONABLY

Montreal.

Lead and zinc goods are reported by dealers to be selling in fairly good volume, and sales during the past two weeks

have been very satisfactory. Prices on some lines show slight fluctuations, but on the whole remain quite steady.

Prices in effect locally are given herewith:

LEAD AND ZINC PRODUCTS—

Lead pipe, per 100 lbs., up to 2 in.	14 50
Do., 2 in. to 8 in.	15 50
Do, 8 in. and over.	16 50

Heavy Japanese Buying May Advance Sheets 25 Cents

THE progress of buying of iron and steel in America for Japanese account has been watched by the metal trades with much interest, since the recent catastrophe opened up a tremendous market almost overnight. Sanitary Engineer has secured information to the effect that the Japanese Government has bought all the black and galvanized sheets of 28, 30, 31 and 32 gauge which can be produced in Europe until early next summer and are now placing larger orders in America. To date, orders for 120,000 tons of

sheets have been placed in the United States, and it is understood that orders for another 80,000 tons are about to be placed. Most U. S. mills will be busy on this business up until February at least, and in some cases until May. As a result of this large market, it is the opinion of certain Canadian metal interests that sheets may show an increase of at least 25 cents by next spring. Some Canadian firms are booking heavily on sheets at present in order to be sure of delivery for next spring.

SALES OF ENAMELLED WARE CONTINUE STEADY

Montreal.

Sales of enamelled ware have shown up well during the past two weeks. Prices are steady and are quoted locally as follows:

ENAMELLED WARE—

Sinks, flat rim—	1 only	2 only	3 only
16 x 24	\$ 7 50	\$ 7 40	\$ 7 30

RADIATOR AND BOILER SALES FAIRLY ACTIVE

Montreal.

Dealers in radiators and boilers report that sales in this line are holding up well, and continued good business is expected for some time.

No changes have taken place in the list or discounts, which are in effect locally as follows:

RADIATORS AND BOILERS—

Radiator list prices are for 1, 2, 3, 4 and 5 column radiators, per sq. ft.

45 in. to 38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60. Discount 44 per cent for hot water, and 45 per cent. for steam.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05; Discount 41 per cent.

Boilers—Round water boilers, sizes from 0 to 10, 52 per cent. off list. Square or sectional hot water or steam boilers, 15 in., 3 per cent. with Ontario Government trimmings, list. Square or sectional water boilers, 19 in. to 36 in., 9 per cent. Square or sectional steam boilers, 19 in. to 26 in., 5 per cent. Ontario Government trimmings, list plus 7 per cent. Square or sectional water or steam boilers, 48 in., list plus 10 per cent. With Ontario Government trimmings, list plus 18 per cent.

Round steam boilers, standard trimmings, 16 per cent. Ontario Government trimmings, 13 per cent.

F.o.b. Montreal, Toronto, Guelph.

SCRAP MARKET SHOWS LITTLE IMPROVEMENT

Montreal.

Dealers in scrap materials report that the market is very quiet at the present time, and little improvement is expected until conditions become more settled in Europe. Average buying prices are as follows:

SCRAP—

Automobile Tires	0 50
Rubber Shoes	0 02
Yellow brass	0 06
Red brass	0 08
Light brass	0 04½
Scrap zinc	0 05
Lead, heavy	0 05
Lead, tea	0 03

SOME IMPROVEMENT SHOWN IN INGOT METAL MARKET

Montreal

The metal market shows a somewhat improved tone this week, especially in tin, which has developed some strength. The situation generally is quite favorable and higher prices in most lines would not be surprising.

TIN.—The October statistics were considered favorable and the market has advanced appreciably both in London and New York. Opinions generally are bullish over the next few months, owing to the continued good consumption and gradual disappearance of stocks in the East. The local market is quite strong at 50 cents per pound.

COPPER.—Without any marked advance being recorded, the situation is somewhat firmer and higher prices will probably be ruling in the near future. Any favorable development in connection with the situation in Europe would naturally assist this. The local market is steady at 18 1/2 cents for electro and 18 cents for Chinese.

LEAD.—Although London declined sharply on Nov. 1, prices have receded to some extent and there appears to be a genuine shortage in England. This will mean that Mexican lead will be diverted there, but it will take a little time to relieve the situation. The American market is quiet and does not reflect the

strength in England. The local market is strong at 9 cents per pound.

ZINC.—This metal has been more or less marking time, but the next move should be upward. English galvanizers are well filled with orders and will probably have to buy further quantities in the United States. The local market is firm at 9 1/4 cents per pound.

Toronto Markets

TORONTO, Nov. 13.—Furnaces and other heating equipment have been selling briskly during the past two weeks, and much repair work along these lines is in progress. Jobbing houses handling heating equipment report that business has been very good of late, and that though a good portion of this work has been delayed this season, it is coming through now in a very satisfactory manner.

Some lines of pipe-cutters have been advanced ten per cent., and Queen's Head galvanized sheets have stiffened in price and are selling 25 cents in advance of former levels. Mica has declined considerably, and copper and brass sheets, tubing, and rods are lower. Easier tones are noted in lead and zinc goods. New lists have been established on Stillson and Trimo frames.

Indications locally show that there is a steady, though very slow improvement of late in collections.

BIG DECLINE IN EFFECT ON BRASS PRODUCTS

Toronto.

A discount has become effective on brass sheets, rods, and tubing during the past two weeks.

The new prices figure out about 25 per cent. cheaper than prices formerly quoted. The decline announced herewith is arrived at by two drops in price which have taken place during the past two weeks.

Brass rods, which previously sold at 32 cents per pound, have been reduced to 24 cents per lb. base.

Other prices of brass are given herewith:

BRASS—

Brass rods, 3/4 in. to 1 in. base, lb.	0 24
Brass sheets, 20 ga. and heavier, in rolls, base, lb.	0 29
Brass tubing, seamless, base, lb.	0 34
Toronto discount, 10 per cent. off above prices, which are subject to standard list of brass extras.	

CANADA PLATE PRICES SHOW FIRM TENDENCY

Toronto.

Prices of Canada plates, though unchanged locally, have shown a tendency toward more firmness of late. Sales in these lines have been very good during the past two weeks. A slightly higher level on Welsh polished sheets may be in evidence in the near future. Prices being quoted are as follows:

CANADA PLATES—

	Per American	box Welsh
Ordinary, 75s	5 85
Ordinary, 60s	6 00	6 10
Ordinary, 52s	5 90	6 00
Blued, 75s	6 15
Blued, 60s	6 00	6 25
Blued, 52s	5 60	6 15
Blued and oiled, 75s	6 25
Blued and oiled, 60s	6 10
Blued and oiled, 52s	6 00
Polished, 75s	7 05
Polished, 60s	6 90	7 35
Polished, 52s	6 80	7 25

ANTIMONY.—This metal has developed considerable strength owing to absolute cessation of shipments from China. There is considerable inquiry in the market and keen bidders for such parcels are available. Prices in England have advanced considerably and the local market is also strong at 9 1/2 cents for English and 9 cents for Chinese.

LEAD AND ZINC GOODS PRICES ARE REVISED

Toronto.

Prices on lead sheets have been revised slightly. The 2 1/2 lbs. per sq. ft. sheets, which were selling at 12 1/4c. per lb., are now being sold at 12 1/4c. per lb., and the 3 to 3 1/2 lb. sheets, which were selling at 11 1/4c. per lb., are now selling at 12c. per lb., and the 4 to 8 lb. sheets, which were selling at 11 1/2c., now sell at 11c. per lb.

Strictly solder, which sold at 29c. per lb., is now quoted at 31c. and wiping solder, which was selling at 27c. now sells for 28c. per lb.

Do., do., less, lb.	0 12 1/4 0 13 1/4

GALVANIZED SHEET PRICES ARE REVISED

Toronto.

Premier and Apollo brands are easier in price and a slight readjustment downward is noted on the 10 3/4 oz. and 28 ga. U.S.

Queen's Head galvanized steel sheets have been advanced 25c. per 100 lbs. The 28 gauge base price on this brand of sheets, which was \$7.25 per 100 lbs., has been changed to \$7.50 per 100 lbs.

The new prices on the other gauges,

Why Not Make This a Plumbers' Christmas?

WHY SHOULDN'T the plumber get his share of the retail trade? For instance a big demand for our Tub Shower Bath Faucet and Combination Sink Faucet for Christmas giving will be created through our advertisements now running in MacLean's Magazine featuring these two sensible Christmas gifts, and you can co-operate by running an advertisement in your local paper.

The people are always clamouring in the Christmas gift season for something which will not be put away on shelves and the giver and gift forgotten. They want an article that will be used 365 days in the year, something really useful, something that will reflect the giver's good wishes in after days.

With a prominent display of the Tub Shower Bath Faucet and the Combination Sink Faucet you are sure to benefit from the demand which these two articles have merited by solving the Christmas gift problem.

MICA PRICES REDUCED ABOUT 16 2-3 PER CENT.

Toronto

A reduction has been put into effect on mica lights for stoves, etc. The former discount, which was 20 per cent. off list, has been supplanted by a discount of 33 1-3 per cent. from list prices. This reduction amounts to approximately 16 2-3 per cent. off former levels.

PIPE CUTTERS UNDERGO ADVANCE IN PRICE

Toronto.

Pipe cutters have been advanced in price, to a level about 10 per cent. above former quotations, on both Saunders' and Barnes' patterns. The new prices are given herewith:

PIPE CUTTERS (Saunders')—	
No. 1, each \$2.40; 2, \$3.50; 3, \$8.85.	
PIE CUTTERS (Barnes')—	
No. 1, \$3.10 each; 2, \$4.10; 3 \$6.85; 4, \$14.50; 5, \$19.75.	

SUBSTANTIAL REDUCTION IN COPPER PRICES

Toronto.

The declining copper market, which has been in existence for the last two months in basic markets, has caused a substantial reduction in local prices of copper products.

This reduction amounts to about 25 per cent. of former prices, particulars of which are given herewith:

COPPER PRODUCTS—	Mont.	Toronto
Price per 100 lbs.—		
Copper bars, 5/8 to 2 in.....	29 00	
Plain sheets, 16 oz., 30 x 72", hot rolled	35 00	35 00
Copper sheet, for polishing, 16 oz. base	45 00	45 00
Copper sheet, for polishing, 16 oz. base	40 00	40 00
Braziers, in sheets, 5 x 8 ft. base	32 00	32 00
Copper tubing, seamless.....	36 00	36 00
Discount on Toronto prices—10 per cent.		
Cut sheets and bars, 5c. per lb. higher.		

COTTON CANDLEWICK ADVANCES TO 73 CENTS PER POUND

Toronto.

The price of cotton candlewick, which has been 69c. per lb., has advanced with all other lines of cotton goods, and is now selling at 73c. per lb.

NEW LIST PRICES ON STILLSON AND TRIMO FRAMES

Toronto.

New list prices have been issued on Stillson and Trimo frames. The new list prices now in effect are given herewith:

STILLSON AND TRIMO FRAMES—

Size	Stillson List price	Trimo List price
6 in., each	0 38	0 40
8 in., each	0 42	0 45
10 in., each	0 50	0 55
11 in., each	0 60	0 70
18 in., each	0 75	0 95
24 in., each	0 95	1 40
36 in., each	1 70	2 20
48 in., each	2 20	2 70
Both of above lines are less 50 per cent from above list price.		

PIG IRON PRICES DECLINE \$1 PER TON

Toronto.

During the past two weeks, pig iron has declined \$1 per ton, making the price of No. 1 \$28.30 per ton and the price of No. 2 \$27.80 per ton. The cause of this further decline is the fact that U. S.A. prices on pig iron have been reduced, this reduction being most noticeable in the Buffalo district.

PIG IRON—

No. 1, per ton	28 30
No. 2, per ton	27 80

INGOT METAL PRICES UNDERGO SOME CHANGES

Toronto.

Though lead has had a good, strong run, one of the leading smelters has reduced the price \$2 per ton.

The reason given for the change is the quieting down of demand, the lead-covered cable makers having been the last class of large-tonnage users to leave the market alone. The decline was partly in sympathy with weakness in other metals. The mark down surprised the trade, especially in view of the constant price advances in London.

Another \$1 per ton advance took place in zinc when the price became 6.35c. East St. Louis. London prices rose 2s. 6d. The rising market has inspired a few purchasers from those who will need the metal shortly. Higher prices are due to firmer ideas of producers rather than a natural advance due to big inquiry.

After the long-drawn-out decline in copper, a better feeling was felt late in the week and prices in primary markets recovered 1/8 cent per lb. This is the first encouragement noted in prices of copper for some period.

Tin took a sharp advance at London. This surprise was partly attributed to the good buying by American traders. On the local exchange Straits deliveries advanced from 1/2c. to 3/4c.

Local market prices on tin stiffened to straight \$46, instead of \$45 to \$46 at the beginning of last week, then early this week, as a result of the sharp English advance, the price advanced on tin to \$47.

Lead has strengthened from \$8 to \$8.25 to \$8.50.

Copper prices remain unchanged at \$18 to \$19.

Local prices are as follows:

INGOT METALS—

Copper, \$18.00 to \$19.00; Tin, \$47.00; Lead, \$8.25 to \$8.50; Spelter, \$9.00; Antimony, \$8.25 to \$8.50; Aluminum, \$23.00 to \$25.00.

CLOSET COMBINATIONS, BOWLS, TANKS AND SEATS SALES FAIR

Toronto

Sales of closet combinations, bowls, tanks and seats during the past two weeks have been selling in fair quantities. Jobbers report that sales in these lines have been up to the average this year, though larger sales were anticipated prior to the beginning of 1923.

Prices now effective are given herewith:

CLOSET COMBINATIONS—	Each

NEW KING WATER BOILER

Has National Distribution

To make King Boilers and Imperial Radiators available to every heating engineer in Canada—and through him to every householder in Canada—branches and agencies have been established at strategic points from Halifax to Vancouver.

A twenty-four hour service is thus made available to over 90% of the trade.

This service, plus the well known excellences of King Boilers and Imperial Radiators is a very valuable franchise. Many heating engineers who have recently become "New King" agents report gratifying business.

SALES OF RADIATORS AND BOILERS STILL VERY ACTIVE

Toronto.

Sales of radiators and boilers still continue to be active, much installation work still being in progress as well as repair jobs, many of the latter having been left very late this season.

Dealers report that much furnace repair and heater work has been started during the first half of November and still continues on a wide scale. Prices on radiators and boilers are given herewith:

RADIATORS AND BOILERS—

Revised radiator list prices are for 1, 2, 3, 4 and 5-column radiators per square foot.
38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60.

Discount on 2, 3, 4 and 5 column standard sizes, 44 per cent. for water and 45 per cent. for steam.

Discount on 1-column standard size, and 2, 3, and 4-column hospital sizes 36 per cent. for water and 37 per cent. for steam.

Discounts on 1 column hospital size water 22 per cent. Steam 23 per cent.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05. Discount 41 per cent.

BOILERS—

Water:

Round 52 per cent. off list. Square 8 per cent. off list.

Steam:

Round. 13 per cent. off list; Square, list plus 7 per cent.

FIRM PRICES MAINTAINED ON COMPRESSION GOODS

Toronto.

During the past two weeks no changes have occurred on compression goods. Sales have been fair in these lines.

3 inch	Less 20%
4 inch	Less 25%
5 and 6 inch	Less 20%
8 inch	net
FITTINGS—	
8 inch fittings.....	net
2 to 6 inch	Less 37½%

Don't Sit on the Dock

The selling of Sewage Disposal Systems is very much like the gentle art of fishing. You can sit on the dock and wait. If the fish are biting it's great fun—if not, it's misery.

To go trolling is the better way. You cover more ground and go where the fish are. Usually you catch bigger fish.

The story of how a Sewage Disposal System will make farm life healthier, happier and infinitely more comfortable is good bait for trolling. Take this story to any farmer in your neighborhood and tell it to him in his own home.

Nine times in ten you hook a fat contract. Worth while, isn't it?

Winnipeg.

WINNIPEG, Nov. 13.—The colder and more seasonable weather which is being experienced at the present time is having stimulating effects on all lines of heating and stove repair business. Lead and zinc goods remain steady. Bath supply pipes show a slight decline. Candle wick has advanced. Force cups have also moved upward. There is a seasonable demand for galvanized sheets. Quotations on compression goods, eavestrough and conductor pipe and other lines remain steady.

FURTHER ADVANCE IN CANDLE WICK

Winnipeg.

A further advance has been recorded on candle wick and revised quotations are 67c. per lb.

BATH SUPPLY PIPES SHOW A DECLINE

Winnipeg.

A slight decline is recorded on some lines of bath supply pipes. One line of plain 9-16 inch O.D. tube with slip joint nut for half-inch I.P. connection at floor, is quoted at \$2.50 per pair; another line of nickel plated 9-16 inch O.D. and annealed brass tubing with slip joint to connect with ½ inch I.P. is quoted at \$2.75 per pair.

HIGHER QUOTATIONS IN EFFECT ON FORCE CUPS

Winnipeg.

Higher quotations are in effect on force cups with threaded neck and handle and size 4 inch is quoted at \$6.20 per dozen.

SALES OF FURNACES AND HEATERS SHOW UP WELL

Winnipeg.

Dealers report that sales on furnaces and heaters have been exceptionally good and at the present time are said to be brisk. Stoves are selling quite actively at the present time and a continuance of good business is expected as the season advances.

GALVANIZED SHEETS SELLING WELL—PRICES STEADY

Winnipeg.

Dealers report a steady demand for galvanized sheet iron. Quotations in effect are as follows:

GALVANIZED SHEET IRON—

16 G. \$8.25; 18 G. \$8.40; 20 G. \$8.40; 22 G. \$8.55; 24 G. \$8.55; 26 G. \$8.70; 28 G. x 30, \$9.00; 28 G. x 36, \$9.30; 10½ ounce x 30 \$9.40; 10½ oz. x 36, \$9.70.

PRICES ON COMPRESSION GOODS FIRMLY MAINTAINED

Winnipeg.

No change has been made in the prices of compression goods, levels already in effect being firmly maintained. Sales are reported to be quiet on these lines.

EAVESTROUGH AND CONDUCTOR PIPE STEADY

Winnipeg.

Prices on eavestrough and conductor pipe continue steady. Dealers report

that sales have fallen off slightly during the past few weeks.

EAVESTROUGH—

Eavestrough, per 100 ft. 8 in., \$8.98; 10 in., \$6.75; 12 in., \$8.10; 15 in., \$11.25.
Conductor pipe, 2 in., per 100 ft. \$7.43; 3 in., \$8.55; 4 in., \$10.80; 5 in., \$15.30.

ENAMELEDWARE SELLING IN MODERATE VOLUME

Winnipeg.

Prices are steady on enameledware. Sales in this line are reported to be seasonable with prices showing no change.

SOIL PIPE PRICES FIRM AT FORMER LEVELS

Winnipeg.

A seasonable volume of business on soil pipe is reported by dealers. Quotations remain steady and unchanged.

RANGE BOILERS FIRM AT PRESENT LEVELS

Winnipeg.

Prices on range boilers continue firm at levels established some time ago. Range boilers of 30 gallon capacity are quoted at \$12.50.

LEAD AND ZINC GOODS REMAIN STEADY

Winnipeg.

A firm tone prevails on the zinc market and sales locally are seasonable. Local prices show no change.

LAYING OUT TAPERING ELBOWS (Continued from Page 25)

in a reverse manner, and because of the slight curvature, the error is sometimes not noticeable.

More Shallow Tapers Are Developed by Triangulation

It is the best practice to first lay these patterns on a separate piece of paper, and then cut them out on the miter lines; then lay them on the metal, marking them off carefully. Be sure to allow edges, a single edge for one edge and a double edge for the other end to allow for locking. If they are to be riveted, a single edge is allowed on both ends, and the rivet holes are spaced equally along the miter lines we have developed.

Tapers of this proportion can be readily laid out by the sweep method; but where more shallow tapers are met with, there the body of pattern for taper can be developed by triangulation, and the miter line points picked from elevation and set off on similar lines in pattern.

Sydenham Stop Cocks

No. 58 Steam

200 lbs. pressure is the test every Sydenham Stop Cock is put under. That's your guarantee that it is:—

Well ground, making good, smooth, tight joints;

Made of prime metal to stand up in any usage;

Made in heavy proportions to withstand strain in installation.

Rigidly inspected.

No. 4032 Water

Carried in stock in all sizes from $\frac{1}{4}$ in. to 2 in.

Sanitary Engineer

Dominates in Its Field

Because—

SANITARY ENGINEER is the only plumbing and heating paper in Canada giving an up-to-date market service in each issue, from Montreal, Toronto and Winnipeg.

SANITARY ENGINEER has exclusive rights for publishing in the plumbing and heating field the splendid articles by Frank Stockdale, America's outstanding merchandising expert.

SANITARY ENGINEER uses more illustrations in the editorial section than any other Canadian paper in its field.

SANITARY ENGINEER is running the most complete and practical series on sewage disposal of any publication in Canada.

SANITARY ENGINEER is the only paper running in each issue a full page illustrated article on sheet metal work.

SANITARY ENGINEER is the only paper running a classified Buyers' Guide in each issue.

SANITARY ENGINEER runs the most up-to-date news service from coast to coast, outnumbering other publications in its field by more than five to one in the number of news items carried.

SANITARY ENGINEER'S editorial policies are conducted along sane, practical lines, based upon the experience of the very best authorities in their respective lines in Canada.

SANITARY ENGINEER is printed on better paper stock than any other paper in its field, thus showing up illustrations to better advantage.

SANITARY ENGINEER is uniform as to make-up, both in its editorial and advertising pages, thus making it convenient for readers.

SANITARY ENGINEER'S news of the trade, convention notes, convention reports, articles on legislation, are the brightest, breeziest, best-written and most complete reports issued to the Canadian plumbing and heating trades by any publication either in Canada or the United States.

SANITARY ENGINEER takes the lead in providing the trade with new, practical ideas, dealer helps, and proving through the printed word that certain plans are being carried out successfully by leaders in the industry.

SANITARY ENGINEER reaches the leading members of the plumbing and heating trade by paid invitation. Copies are not sent out indiscriminately. The paper is of real practical value to its subscribers, and they willingly pay a fair subscription price for it. This ensures reader interest and attention.

SANITARY ENGINEER carries in each issue a large volume of high-class advertising, and most of the representative manufacturers and supply houses use its pages regularly to carry their messages to the Plumbers and Sanitary and Heating Engineers of Canada.

SANITARY ENGINEER maintains, in addition to regular editorial and advertising staffs, correspondents located in the most important parts of Canada, and in this way provides readers with the splendid news service which is not duplicated by any other publication.

Subscription price, \$2 per year.

KERR VALVES

Strength To Meet Every Test

These gate valves are specially designed to comply with the requirements of the Factory Mutual Fire Insurance Companies' specifications for Sprinkler equipment.

Bronze bushed Stuffing Boxes, and Malleable Iron Glands are employed, and stems are of the dimensions and strength required on this exacting work.

Commercial valves of our manufacture are supplied in this pattern with this equipment, thus insuring a remarkably high-class valve.

The valves are compact in design, sturdy construction, and modern throughout. Iron Body, Bronze Mounted, with outside Screw and Yoke.

PNEUMATIC WATER SUPPLY SYSTEM

Gives country residents all the advantages of a city water system without the excessive cost

The wide-awake dealer will make big profits out of this system among customers who now have difficulty with their water supply. It is so simple to operate and costs practically nothing for upkeep.

The outfit consists of an air-tight steel tank which can be placed in the basement, and a "Myers" famous guaranteed pump (hand or power), suitable for pumping air or water, together with pipes and fittings.

Any plumber or gas fitter can easily install it. Every outfit guaranteed to do the work for which it is designed. For small or large dwellings.

Write us for Water System Catalogue and prices. Now is the time to interest your customers.

Burnham Boilers

There Was No Monkeying With the Fire Travel

The Burnham Twin Section Boiler has all the strong points of the square sectional. Most important of all, it has the same long fire travel to make its short coal bills.

It is very conservatively rated. In fact, what the Twin has done this past winter has opened the eyes of all of us. No better cast iron boiler made for low pressure heavy duty work.

Send for Catalog.

The Greatest Value Obtainable in Ceiling Plate

TOP VIEW No. 10.

Our No. 10 Split Ceiling Plate can be attached to mains and risers at the very last, and is not exposed during completion of a building on the floors, thereby making an attractive finish. Made in all sizes from 1-4 inch to 6 inches inclusive.

The No. 10-A Narrow Flange Plate is a steel hinged plate flange 3-4 inch wide. Highly finished. Especially designed for twin connection "narrow." Made in sizes from 1-2 to 2 inches inclusive. Write for catalogue showing our complete lines of specialties.

GEM NO. 4 AUTOMATIC AIR VALVE

The best brass possible to obtain is used, and greatly preserved against corrosion from plating acids because they are nickel plated before being assembled. This valve is simple to adjust and works automatically.

GEM No. 4

RADIATOR HANGER

YOU'LL USE 'EM YET!

STYLE R

They make quicker and easier work of installing radiators, (1) Do not require accurate placing of anchor bolts, (2) Only one anchor bolt per hanger, (3) Adjustable both laterally and vertically. Out of sight when installed. Write for full information.

Made in Canada

Healy - Ruff Co.

Dept. 23 - Minneapolis, Minn.

Are These The Opportunities You're Looking For?

Fan Heating and Ventilating Engineering is the pinnacle of all other forms of heating, and of all branches of steam fitting and sheet metal work. It prepares you for:

1. For Employers it enlarges their business opportunities 100%.
2. Employees it raises to Foremanship of a large shop.
3. Or as Designing Engineer of some large Heating Contractor.
4. As an intelligent Salesman of Heating Appliances.
5. As Chief Engineer with a Heating or Furnace Manufacturing Company.
6. Later a Consulting Engineer to Architects and Building Contractors, etc.

Which of These Are You Working for?

Full Information Free.

"Yes, Madam, Your Husband was a Careful Investor"

Will your banker be able to give widow this assurance?

YOU do not save money for the mere joy of having it. You have a definite purpose in view. It may be to protect your own later years; to educate your children and start them out in life or to sustain your widow and dependents should you yourself pass on.

For these purposes you save—and invest what you save. It is a sacred trust. To fulfil it you must put that which you save where it will be safe, first, and produce a good income, second. You do this by investing.

Only carefully made investments will achieve your ends. Careful investing is based upon sound information.

You can get this necessary sound information and advice weekly in **THE FINANCIAL POST.**

Subscribe to-day. Lay the foundation of your fortune on the solid rock of knowledge.

Tank Insurance

Before Vitro Fittings are put into Vitro Tanks they are tested. Again, **after** they are installed in the tanks they are tested. This double check on a product made of highest grade materials by skilled craftsmen and after passing numerous shop inspections during manufacture, is your finest tank insurance. This mechanical perfection is encased in a Vitro Tank of softly gleaming virgin whiteness with a graceful sweep of line that bespeaks its aristocratic lineage.

There are in use in Canada to-day 250,000 Vitro Tanks, ample proof of Vitro's superiority in its chosen field.

"Emco" Concealed Fittings Give the Last Touch of Refinement to Tiled In Baths

AFTER all, it's the trimmings that make the picture.

That's why "Emco" concealed bath fittings have become so popular with the plumbing trade; their nickelled plated, highly polished, exposed metal parts and the white porcelain escutcheons add tone to the well appointed bathroom.

And "Emco" tiled in bath fittings are easily installed; manufactured so that the maximum of adjustment in installation is allowed.

"Emco" concealed bath fittings are used in the better class installations in the homes of Canada. The modern trend of the public is towards concealed bath fixtures and that of the plumbing trade toward "Emco" concealed fittings because of our reputation in the manufacture of plumbing supplies and our guarantee that every article is tested under pressure and guaranteed to give satisfactory service.

If your jobber does not handle "Emco" products, write us.

Where an Extra Heavy Closet is Required

The "Veteran" extra heavy closet has been designed to meet any requirements where unusual weight and strength must be combined with the other essentials of a good closet.

It is of heavy syphon jet construction, splendid strong action, having extended front lip, integral seat and raised rear vent, and being solid vitreous through and through is supremely sanitary.

Its rugged construction, with a net weight of approximately 85 lbs. combined with its hard-burned impervious body and sheer white glazed surface ensure years of unchanging service.

We have recently had the honor of furnishing this closet on several export contracts where Government specifications demanded the very highest quality vitreous ware.

When You Strike a Snag in a Welding Job—

Write, telephone or wire to us. Our Service man will help you out of the difficulty. We go further than simply helping you in emergencies, our service men are also available for the bettering of shop practice pertaining to welding and cutting operations.

There may be ways in which you can profitably employ a welding and cutting outfit in your plant that have not occurred to you. Ways of reducing costs, and short cuts which will increase production. Our Welding Engineers will make a survey of your plant and operations at no cost to you. They will advise you how to make better use of your present welding equipment or how you can more profitably employ your cutting torch.

This service is gratis to *our* customers. It is the plus part of Dominion service which has influenced an ever-increasing list of manufacturing plants, contractors, ship yards, steel plants, and transportation companies to use Dominion Service for their oxygen and dissolved acetylene requirements. You, too, can use Dominion Service to advantage. Your request for information will be given prompt attention.

RUUD INSTANTANEOUS Automatic Gas Water Heaters

Ruud Condensation Sheds Mean Long-Life

A thousand cubic feet of manufactured gas contains about six gallons of water. In an ordinary gas-burning appliance, this water is carried out through the flue in the form of vapor.

An efficient instantaneous automatic water heater will not let enough heat escape through the flue to hold this water in vapor form. The small drops deposited on the upper coils is called "condensation."

The downward drip of this condensation is sometimes mistaken for a leak in the coil. It contains some sulphuric acid and is very destructive to the heater base and burners if allowed to come into constant contact with these parts.

RUUD eliminates the evil effects of condensation by disposing of it before it can injure these vital parts.

Light cast iron sheds, placed between the spool sections of the coil, divert the dripping condensation to the heater liners.

The downward journey is continued until caught by a circular ring collector suspended below the coil. Then it is drained from the heater through a lead tube in the rear.

An efficient heater must produce condensation—if there is none, valuable heat is being lost through the chimney flue.

RUUD Condensation Sheds and Collectors do not eliminate condensation—they eliminate the evil effects of condensation, thereby adding years to the life of the heater and saving repair expense.

Condensation Sheds and Collectors are found in RUUD Heaters only. The feature is a particularly important one to the dealer or user living in a climate subjected to low temperatures.

Let RUUD design, RUUD quality and RUUD engineering experience protect you and your customers. Sell RUUD—the heater that sells.

A Lavatory in Every Spare Bed Room

If a customer cannot see his way clear to having every bedroom opening on a bathroom you can at least sell him the idea of having a lavatory in every bed-room — preferably a "Standard" pedestal lavatory.

Such propaganda gives your customers greater satisfaction and comfort and creates more profitable business for you. Provided, of course, you install "Standard" Plumbing Fixtures.

*Advertising !
The tonic that
builds up
business*

There is no tonic that will build up Business so substantially as Advertising! Watch for our effective campaign for "Standard" Plumbing Fixtures now running in Canadian newspapers and magazines.

Licensing of Sanitary and Heating Engineers and Tinsmiths for New Sales Tax

Study of New Sales Tax Regulations Should be Made Because Operators Doing Over \$10,000 a Year Will be Licensed and Compelled to Pay Sales Tax to Government on all Sales Commencing January 1 Next

EDITOR'S NOTE:—As the time draws near for the application of the new Sales Tax regulations, which will apply in more definite form to plumbers, heating engineers and tinsmiths than do the present regulations, many enquiries are coming to *Sanitary Engineer* for information concerning the status of these operators under the Act. The matter was fully discussed with an official of the Customs and Excise Department and a clear outline of how the regulations will apply to readers of *Sanitary Engineer* appears in the following:—

AT THE present time there are practically no sanitary and heating engineers or tinsmiths in the group including licensed parties, except for some tinsmiths who have been classed as manufacturers in certain parts of the country, due to the special interpretation of the local Collector of Customs and Excise. It will be recalled that there were a number of test cases held to determine whether retailers making goods to special order were manufacturers for the purpose of the Act, and at first there was a differentiation between tinsmiths and blacksmiths on the ground that the product of the former, even if made to special order, could be sold at retail to anyone else, whereas the product of blacksmiths and tailors would not ordinarily be sold to anyone other than the one for whom the article was made. The line was drawn pretty fine, however, and, in view of the fact that the usual 4½ per cent. sales tax applied in any case, whether the operator was licensed or unlicensed, no very serious attempt was made to enforce the licensing. True, some Collectors insisted upon certain tinsmiths taking out licenses and collecting sales tax, but there were not many of them.

Change the Practice

Under the new regulations, effective from Jan. 1 next, the whole practice is being altered with the idea of eliminating the pyramiding of the tax formerly existing and collecting the tax at the source of manufacture or importation. In order to carry out this principle, it immediately becomes necessary to license all manufacturers of any appreciable size and hold them responsible for the collection of sales tax. In eliminating the pyramiding feature of the tax, it is obvious that most wholesalers, who are licensed under the present regulations, will not be licensed under the new plan. Thus, while many plumbers,

heating engineers, tinsmiths, tailors and others will be licensed for the first time under the new regulations, the total number of licensed parties who will collect sales tax and return it to the government in future is really much less, due to the elimination of most jobbers. It is estimated by the Collector at the port of Toronto that, whereas formerly there were about 5,000 firms licensed in that district alone, there will be only about 3,200 under the new regulations.

The provisions of the new Sales Tax Act to be applied Jan. 1 read as follows: "Every manufacturer or producer who manufactured or produced goods to the value of \$10,000 or more during the fiscal year ending March 31, 1923, or during any fiscal year thereafter, shall take out an annual license with a fee not exceeding two dollars."

Includes Plumbers

The foregoing includes plumbers, heating engineers and sheet metal workers, according to government officials. Special provision is also made for the licensing of firms doing less than \$10,000 business if such manufacturer uses a substantial portion of tax exempt goods, but there will be very little, if any, of this in the plumbing business, as most exempt goods are edibles, metal ores, precious metals, electricity, gas, oil, etc.

It is pointed out that it will be somewhat of an advantage in some ways for the larger operators to be licensed, as will be the case under the new regulations, because of the fact that they will have no capital tied up in sales tax paid on materials on hand. They will be the ones to collect sales tax on their sales and make returns to the government.

A point arises here as to whether sales tax shall be applied on the total value of the transaction, including labor cost, or merely on materials used. On making endeavors to get a ruling on this point, *Sanitary Engineer* was informed by an official of the Department of Customs and Excise that this point would be cleared up any day now. In the past, no sales tax has applied on the labor charges and it was said to be likely that the same policy would be continued, under the new regulations, with sales tax applying only to the charges for material used.

A Problem

Another question propounded by *Sanitary Engineer* was as to whether various appliances and equipment sold at retail by the plumber would be included in the \$10,000 turnover of

manufactured goods, which would determine whether or not he was to be licensed. It was impossible to get a definite ruling on this point as yet, but it was the opinion of the official that these could be classed as retail sales and not included in the amount which determines his status under the Act. After it has been decided, however, whether the plumber is licensed or unlicensed, the sale of such appliances will be treated in the same form as the sale of any other equipment which is partly assembled and installed by a plumber. He will collect the tax and return it to the government on all sales if he is licensed, not paying any tax on the materials when he makes purchases; or, if unlicensed, he will be called upon to pay tax at time of purchase and collect no tax on his own transactions, making no returns to the government.

It will obviously make matters more difficult in some ways for manufacturers and wholesalers selling to plumbers. On sales to licensed plumbers, no tax will apply, and on sales to unlicensed plumbers, tax will apply, so care will have to be taken to differentiate. The onus is put on the buyer to a very large extent, however, to see that he is protected from the duplication of the tax. The matter is simplified if it is kept in mind that the tax is only meant to apply on one transaction of the material, and it is generally at the source of importation or manufacture. It should also be remembered that only a licensed party collects tax and returns it to the government. A wholesaler is licensed if he sells over 50 per cent. of his goods to licensed parties. The matter is best traced by following the trend of certain material as follows:—

A Case Outlined

A licensed manufacturer sells an article to a licensed wholesaler, collecting sales tax of 6 per cent. and making his own return to the government. The licensed wholesaler, if he sells that material to an unlicensed plumber, charges the sales tax along in the price he quotes (not as a separate charge) and the plumber in turn passes it along in his charges to the consumer when he sells the material. If that licensed wholesaler sells the goods to a licensed plumber instead, the latter must quote his license number when buying, state that the goods are for resale, and then the amount of the sales tax paid by the wholesaler when he bought the goods will be deducted from the charge to the licensed plumber, thus leaving the goods free from tax. When the licensed plumber in turn sells the material to his customers, he must make the charge for sales tax of 6 per cent. (included in the charge and not shown separately) and make his return periodically to the government, as laid down in the regulations.

An alternative case would be where the wholesaler is unlicensed, so we will trace the course of material through that channel. The licensed manufacturer sells material to an unlicensed wholesaler, the

sales tax being collected by the manufacturer and returned to the government when he makes the sale. The unlicensed jobber selling that material to unlicensed plumbers carries no special sales tax charge, but if a licensed plumber buys that material from the unlicensed jobber, he must quote his license number, state that the goods are for resale, and then the amount of tax is deducted, application being made by the unlicensed jobber for refund of tax paid on the material when he purchased it. The licensed plumber will, of course, collect the sales tax when he sells the material, thus it is seen that either way the tax is applied only once and by a licensed party.

Buying For Own Use

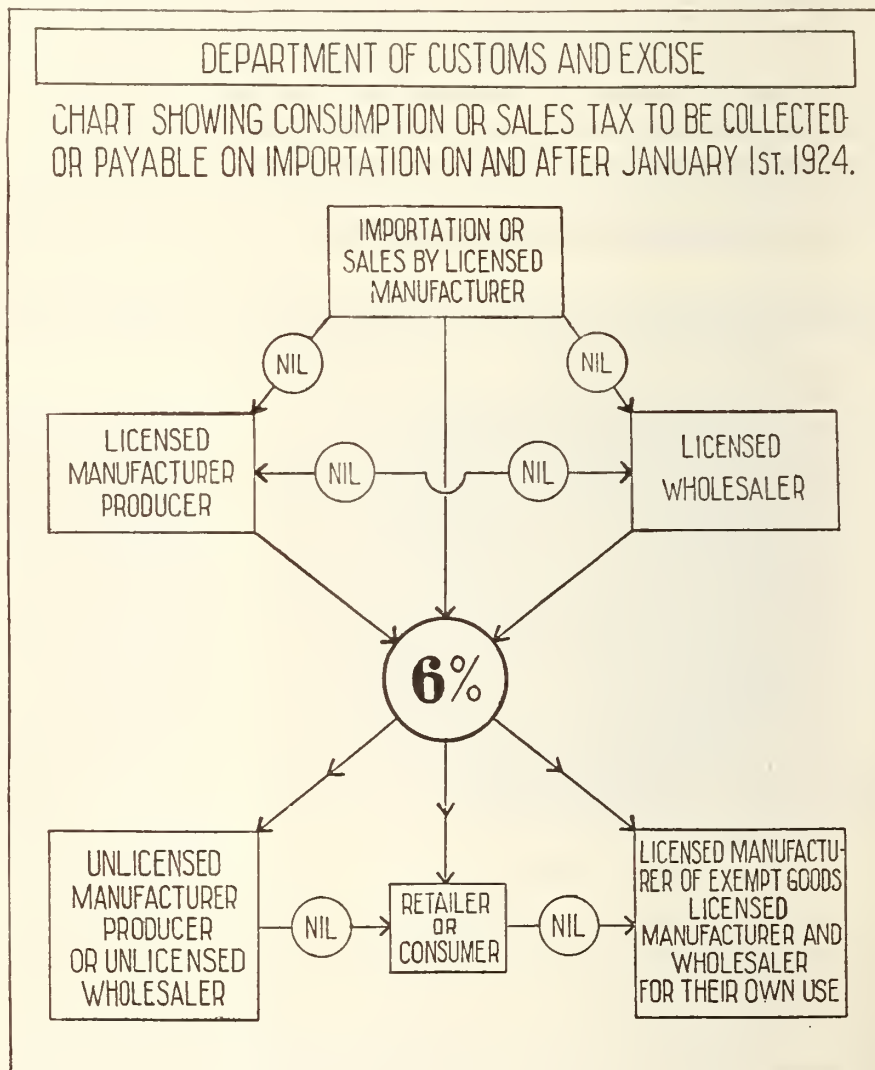

A licensed wholesaler or plumber buying materials for his own use or for consumption in his plant must not quote license number and state that goods are for resale, because, as the final consumer of those goods, he is expected to pay the tax on them.

Sales tax is computed on the price for which the goods are sold, including excise duties on goods sold in bond. It is specially provided that on sales by licensed persons to retailers or consumers the amount of the sales tax must not be shown as a separate charge on the invoice, but be absorbed and charged in the price quoted. On sales by a licensed manufacturer to an unlicensed wholesaler, however, it is provided that the written invoice of the goods shall state separately the amount of the consumption or sales tax.

The subject will be discussed further in the next issue of Sanitary Engineer, when definite rulings on some important points will be outlined.

USE CITY GARBAGE AS FUEL

Toronto.—Controller Gibbons is of the opinion that the city's garbage incinerators might be linked up with a system of steam-produced electricity. He contends that there is a heat of 600 degrees going to waste in the incinerator furnaces that could be used.

Handy reference chart which shows clearly the stages by which the new Sales Tax of 6 per cent., effective January 1 next, is passed along, and on what transactions it is collected.

Urges More Attention to the Merchandising of Heating Equipment

Heating Engineers Too Much Mechanical and Not Strong Enough on Commercial End of Business—Thousands of People Will Buy New Phonograph or Sewing Machine Before a New Boiler Because Other Lines are "Sold"

Address by W. R. GIBSON, general manager Gurney Foundry Co., Ltd., Toronto, before Hamilton Sanitary Engineers' Social Club

DUE to the inability of E. Holt Gurney, president, Gurney Foundry Co., to be present as the chief speaker, W. R. Gibson, general manager of the company, gave the address of the evening at the last meeting of the Hamilton Sanitary Engineers' Social Club. Many interesting points in regard to the heating industry were outlined, these concerning possibilities for business and ways in which heating engineers can best co-operate with other branches of the industry. Mr. Gibson's address follows:

"The relation between most of the manufacturers and the sanitary and heating engineers has been most pleasant and harmonious, and I believe it is improving each year. Yours is a most necessary and useful branch of industry for you have the health of the whole world in your keeping. Yours is an old industry. The aqueducts of old Rome and the sanitary and heating arrangements constructed in those days testify to the age of your profession.

"In our industry we must bear in mind the three parties we have to consider, namely: user, installer and maker. The user is our referee and it becomes necessary for us to get together to minister to his health and comfort if we want to give satisfaction in any community. We should see that we establish efficient and satisfactory relationships that will promote this object.

Traveller Friend of Engineer

"One of the most important factors to be considered in the relationships of manufacturer and installer is as regards sales. In these days of complicated business relations, financial problems, labor troubles, etc., the travelling salesman is the one who is the best friend of the engineer at all times. He is the promoter of better relations. The office, collection department and plant may be trying their best to make it appear to you that we are not anxious for your business but if you will come into our office you will find the traveller there raising Cain about breakages, shortages, credit notes, etc., in your interests. You have no better friend at court than the travelling salesman who calls upon you.

"Our relations are also affected by matters pertaining to manufacture and distribution, such for instance as the

problem of delayed deliveries. Our trouble as manufacturers is the immense variety of stocks and varying quantities which are required. One of our big problems is to take care of the seasonal business in a rush, such for instance as handling all the fall business within the short period of six weeks. It would help out if you could anticipate your requirements and impress on the architect and the builder the necessity for getting specifications in early.

Many New Seating Systems

"One of our big problems is in connection with the tremendous multiplicity of heating systems that are developing, and here your problem is equally great. You should go into them and study them thoroughly so you can co-operate with us in supplying proper equipment when wanted. A great many changes are frequently made in orders after they are sent in and put in process of manufacture. This obviously complicates matters very considerably. In one case a shipment of 126 radiators was at the shipping dock and we had to

cart them back to the plant and take a loop out of them to satisfy some late changes. This is a big loss of time, makes it hard to fill orders promptly and increases production costs. You should prevent your customer altering his plans after you have put your tender in because many heating engineers lose money through such changes.

"In connection with returned goods I would mention that some engineers forget to place tags on material sent back. It is obviously difficult to handle such cases until they are identified. If you at any time overlook putting a tag on material you should follow it up with a letter. Sometimes we send out some wrong tappings or other equipment and we get after the plant manager about it. When the next order from the same customer comes in, however, we frequently note that he has got the dimensions wrong or has a mix-up in the columns on the specifications. It is the old question of the human equation.

Send Orders in Clearly

"The office is a much abused institution. They do try to serve you, but their job is highly complicated by the number and variety of requirements. Engineers can help by seeing that orders are sent in clearly. The collection department appears to be doing its best to get every account off our books but this is not so. They are trying to cut down the gap between our payments for materials and the time when we get payment for our products. When they get after you about paying, remember that they have someone on their collar all the time. We must have money to prevent the moulders and other employees from tearing down our plant every pay day. Thus in our office and sales relations we must have mutual forbearance and co-operation. The engineers are 50 per cent. of the show and must co-operate with us as well.

"During the last couple of years prices have had a big effect on our relations. The price situation causes a great difference of opinion. I cannot assure you that there is going to be any great reduction within the near future. Wages to labor constitute the big item in the material right from the mine, and represent such a big production of cost that the price of finished products cannot be reduced without shaking the whole foundry

W. R. GIBSON

General manager Gurney Foundry Co., Ltd., Toronto, who gave a very instructive address on problems of the heating industry before Hamilton Sanitary Engineers' Social Club.

dations of the structure. The altered regulations concerning the Sales Tax are trying the patience of many manufacturers for no one seems to know what is going to be done. It is one of the most muddled situations ever known. We do not want to dodge it, but we do not want to have anything approaching the old luxury tax which was so unpopular.

Public Takes Liberties

"From your standpoint collections are a most important consideration. There is no business in Canada of which the public takes greater liberty in this connection than the sanitary and heating industry. We are one of the last to get to work on a building and if there is any money left we may get it. Most of us are better engineers than collectors and here lies the trouble. You should remember that when you do an honest job you should have no hesitation in asking for your money. The \$100 bill that you circulate quickly pays about \$1,000 in foundry bills, grocery bills, etc.

"We have been placed in a beautiful country but a cold one. Our business is to see that the homes of this country are properly heated. Your business is to see that the proper system is used and properly installed. This brings us close together. There are no two branches of any Canadian business that should be working more in harmony. As manufacturers and engineers our problems have always been largely mechanical as far as our appreciation of them is concerned. The result is that both of us handle every problem from a mechanical point of view. We must change this and do all we can to get on to the other foot, viz., the commercial or merchandising end of the business. We can furnish various merchandising helps and are anxious to do all we can to get away from this top-heavy mechanical point of view. This is where the manufacturer and installer fall down, as far as the user is concerned.

Seasonal Business

"If you will study the situation you will see that our harvest comes seasonably, and this is hard to overcome. The only reason we are supplying heating equipment is because the customer must have something to keep him warm. If it depended upon mechanical knowledge alone we would sell only about 25 per cent. of the present installations. We are not sufficiently sold on the sales idea. Within a few blocks of this building there are 1,000 people who will have a new auto or radio set long before they will have a new boiler. That is because the fellow selling those lines is of a commercial turn of mind rather than mechanical. We must struggle with this problem because it is the biggest one before us.

"As manufacturers, our biggest specific problem is consistent operation of our plant. To have this we need a very steady flow of orders and a consistent

WHEN CANADA STOLE A MARCH ON THE U.S.

A true story which is told with pride by W. R. Gibson, general manager of Gurney Foundry Co., Toronto, is to the effect that the old E. & C. Gurney Co., founded in Hamilton in 1843, was the first to introduce into the United States a round hot water boiler. He also claims his is one of the few Canadian concerns that have gone across into the U.S. market and established a plant and sales force operating just as strongly as the head office in Canada.

sales policy. We get business in proportion to the energy we put into the selling. There is too much seasonal activity. I will give you one of Mr. Gurney's thoughts on this subject. He said, 'I wonder who, in the selling end of the business is following up the furnace men of cities like Toronto and Montreal. The men who look after furnaces have the best knowledge of the condition of the equipment they are tending and know where new furnaces or parts are needed!' That is only one channel," continued Mr. Gibson. "Some business comes easy because people must have heating equipment, but that business could be much enlarged by selling effort. If we develop our sales and merchandising instincts we will soon find that people will be presented with propositions for improving the heating of their homes just as they are now presented with propositions to buy sewing machines, phonographs, etc."

In conclusion Mr. Gibson briefly reviewed the history of the company since the days when the old E. & C. Gurney Co. was born in Hamilton in 1843, being one of the first in Canada to manufacture and market boilers and radiators.

HAMILTON S. E. S. DINNER SCHEDULE

The Sanitary Engineers' Social Club of Hamilton, the account of whose meeting will be found in this issue, have arranged an interesting program of dinner meetings for the coming months, to which they are extending a cordial invitation to anyone connected with the plumbing industry. The dates of the dinners, which are held in the Arcade Dining Hall from 6.15 to 8 p.m., are as follows:—

December 5,
December 19,
January 16,
February 13,
March 12,
March 26,
April 9,
April 23.

Contracts Awarded

Toronto—G. A. Chrisholm, 44 Lakeside Ave., has the plumbing contract and B. J. Iler, 550 Bathurst St., the heating contract for five residences and garages, \$12,000 each, at 31-33 Austin Terrace. A. Clark & Son, owners and builders.

Toronto—H. Ruddick, 54 Appleton, has the plumbing contract and J. G. Jackson, 311 Kennedy Ave., the heating contract on \$21,000 duplex residence on Northcliffe Blvd., Harry J. Long, 76 Glendonwyne Ave., owner and builder. They also have the contracts on \$10,000 duplex being built by Mr. Long on Snowden Ave., and a \$12,000 residence on Regal Ave.

Toronto—George Copperwaite, 118 Langford Ave., has the contract for heating and plumbing for two residences, \$10,000 each, at 74-76 Dawlish Ave.

Brampton, Ont.—Higgins & Large have the plumbing and heating contracts for \$45,000 Sunday School being built for Grace Church congregation.

Cornwall, Ont.—Arthur Rabineau has the roofing and plumbing contracts on \$65,000 school being built here.

Kingston, Ont.—Simmons Bros. have the plumbing and heating contract on \$103,000 addition to dormitory for the Royal Military College.

Montreal — L. E. Moulton & Co., have the plumbing and heating contracts for \$25,000 repairs to residence at 443 University St. for parish of Christ Church.

Ottawa.—W. G. Edge Co., have the plumbing and heating contracts on \$18,202 addition to chemical laboratory.

Toronto—W. G. Edge Co., Ottawa, have the roofing and A. E. Melhuish, 1174 College St., the plumbing contract in connection with stables being built by the city of Toronto.

Hamilton — Bert Dalen, 241 Glendale Ave., has the contract for sheet metal work in connection with \$35,000 office and apartment building on Main St., E., at Delta.

Toronto—Thomas Maxwell, 1221 College St., has the plumbing and heating contract on two duplex residences, \$30,000, at Parkside Drive and Valley Crescent.

Toronto—J. T. Henry, 9 Louisa Ave., has the plumbing contract on one pair residences, \$6,500 each, on Kenwood Ave., near Louisa.

Verdun, P. Q.—Z. & O. Cadieux, 1256 Wellington St., has the plumbing contract and Reid Cambridge, Green Ave., the heating contract, on \$10,000 cottage being built on Lasalle Road.

Windsor, Ont.—S. Wilson, 189 Goyeau St., has the plumbing and heating contracts on \$4,500 residence being built on Hall Ave.

Windsor, Ont.—A. D. Belair, Dougall Ave., has the plumbing and heating contracts on \$6,500 residence on Hall Ave.

Campbellton, N.B.—A. H. English has the heating and plumbing contracts for \$150,000 hotel being built on Roseberry Ave.

Montreal.—E. Tremblay, 13 Perrault Lane., has the roofing, plumbing and heating contracts on \$60,000 residence, corner Robin and Amherst.

Montreal—The Metal Shingle & Siding Co., Ltd., have the roofing contract and John Colford & Co., the plumbing and heating contracts on \$90,000 factory on St. Catherine St. for Dominion Oilcloth and Linoleum Co.

Campbellton, N.B.—Heating and plumbing contracts are still to be let on the \$150,000 hotel on Roseberry St., owned by Chateau Restigouche, Ltd. J. and D. A. Harquail Co., are the general contractors.

Hamilton—Plumbing and heating contracts are to be let on the market being built at Ottawa and Barton Streets by W. J. Lord, James St. N.

Christmas Tree Cleaned Out Plumber's Stock of Small Plumbing Appliances

The Suggestion of Plumbing Equipment and Small Fixtures as Gifts Can be Made to Result in Added Profits—Holiday Trade is Mostly Cash Business—Prepare the Home for Guests' Comfort

DURING the month of December, in all channels of trade dealing direct with the consumer, there is a heavy increase in sales, due to purchases being made for Christmas gifts. Years ago, this pre-Christmas buying was more limited in its scope, but to-day concentrated effort on the part of the dealers has developed the trend of this buying along innumerable lines, and the enterprising heating and plumbing engineer has not been slow to grasp the opportunity of pushing his goods at this season.

It is a recognized fact that this class of business must be approached from an entirely different angle from any other class of sales, the gift angle being made the pre-eminent one in all advertising, sales talks and displays. If the prospect can be made to feel that the goods being offered are such that they would make suitable gifts, the chances of closing the sale are greatly enhanced.

One of the big opportunities along this line that is open to the proprietor of a plumbing shop, is to be found in the sale of such equipment as those small wares, popularly known as "bathroom jewellery," medicine cabinets, shower attachments, gas heaters, temperature regulators and, in the case of the shop where such lines are carried electrical appliances. These require little service other than the actual making of the sale and cover a popular range of prices.

In displaying these goods in the show window, care must be taken to emphasize the gift angle. Show cards should make the suggestion, while a seasonable atmosphere may be given to the window in a few minutes and at small expense by the use of crepe paper and tinsel.

Christmas Window Trims

And touching on the use of crepe paper, it is well, too, to remember and to put into effect the fact that the Christmas gift idea can be much strengthened by putting up the goods sold in seasonable wrappings. Crepe paper or tissue paper make the most seasonable containers and if fastened with a Christmas sticker or tied with ribbon cord, the appearance certainly adds a lot to the selling possibilities, particularly if two or three wrapped gifts are shown in the window trim.

An effective trim can be made by showing a Christmas tree, at the bottom of which are a number of parcels, partly opened and others still tied up.

Those which have been partly opened dispose a portion of their contents, in each case, some article sold in the shop which the proprietor wishes to suggest to the prospect as a suitable gift purchase.

The addition of address cards or stickers, decorated in a holiday design, may also be used, adding a certain amount of suggestiveness and distinctiveness that will prove a good drawing point. These may be secured at a trifling cost at the nearest stationery shop.

A profitable field open to the plumber in selling equipment as gifts, however, lies in the larger installations, items which would not, perhaps, suggest

themselves so naturally to the average person as gift possibilities, and it is on these that the plumber would do well to concentrate the greater part of his attention.

Larger Installations Profitable

Washing machines have become a favorite Christmas gift, and it is only a step further to the suggestion of stationary tubs or the entire remodelling of the laundry. The man who is interested in providing his wife with labor-saving and time-economizing devices, will welcome the suggestion that a rearrangement of the laundry or kitchen would save her countless steps and work. Extra bathrooms, private

Here is a Christmas tree decorated lavishly with the usual seasonable decorations and bearing a wide range of plumbing appliances. It is an oddity which will attract much attention in the plumbing show window, and in a year when practical gifts are being given it will help to stimulate sales of these lines.

Always consistent in their efforts to sell plumbing equipment during the Christmas season, the firm of Ecclestone & Bates, Bracebridge, Ont., have had considerable success. With tasty Christmas decorations, a wide range of suitable gift lines are shown in the above display. Many sales are made and a good chance given to talk business to prospects for larger equipment.

lavatories or shower baths for each bedroom can also be sold on the gift suggestion idea.

In fact, during the holiday season, installations of practically every type can be pushed effectively if suggested as Christmas gifts. To the father of a family they mean remarkably fine presents to wife and children. Men who would not be easily interested in additional equipment if approached through the ordinary channels at other times of the year can be appealed to with telling effect by means of this entirely different phase.

The strategy of the thing lies in making the gift suggestion as frequently and as strongly as possible. Actual experience with products which ordinarily were never thought of as gift possibilities has proven that, when the suggestion is made and artfully developed, the desired reaction is secured in the great majority of instances.

People are thinking of what they are going to purchase as gifts, never an easy problem to solve, and any reiterated suggestion is going to leave its impress on the minds. What is better, they have money set aside for the purchase of these gifts and the majority of sales made will be on a strictly cash basis.

Use Christmas Tree

One of the most effective Christmas plans, is to erect a Christmas tree in the show window, and hang on it samples of various pieces of plumbing equipment. This plan was suggested in Sanitary Engineer last year and was used by a number of plumbers to good advantage. One Ottawa sanitary engineer who used it, stated that his stock

of such appliances was absolutely cleared out in the pre-Christmas trade, and he found it necessary to buy a second stock of these lines. The Christmas tree is, of course, decorated with tinsel and other material to give an attractive appearance.

Better Guest Accommodation

Another angle which may be played up successfully at this season of the year, is that of preparing the home for the accommodation of guests. Perhaps at no time of the year is visiting done more extensively than in the latter part of December. At Christmas time, the young folks seek the parental roof for over the holiday and during the week that follows, the social festivities which are then at their height, find numerous guests in homes all over the country.

The householder naturally likes to have his home as attractive and as comfortable as possible for the accommodation of the guests, and the appeal along the lines of added comfort through the installation of an extra bathroom or the private shower for each bedroom, is one which frequently can be used successfully at this season.

Pig Iron Production Shows Slight Decline

THE October output of pig iron in Canada showed a slight decline to 73,593 gross tons, as compared with 75,216 tons produced in September. The average monthly production for the ten months ending October this year was 76,000 tons, and the total production during this period of 758,194 tons showed an increase of 142 per cent. and

50 per cent. over the outputs in the corresponding periods of 1922 and 1921, when the quantities produced were 312,877 tons and 506,730 tons respectively.

The entire output of basic pig iron, amounting to 40,986 tons, was made for the further use of the reporting firms; this was 11 per cent. less than the September production of 45,826 tons. Foundry iron, mostly for sale, remained about the same at 17,377 tons; malleable iron, made for sale, showed an increase of 37 per cent. to a total of 15,235 tons.

The total October production of steel ingots and castings in Canada was 67,496 tons, an increase in all grades amounting to 1,162 tons more than the September output of 66,334 tons. The increase in the basic open hearth steel ingots production was 735 tons, making a total of 62,870 tons for the month. The output of 4,626 tons of steel castings marked an increase of 427 tons distributed by grades as follows: Basic open hearth steel castings rose 145 tons to 2,726 tons; acid open hearth castings increased 117 tons to 653 tons; bessemer castings advanced 100 tons to 413 tons, and electric castings 65 tons to 834 tons.

The average monthly production for the ten months ending October was 79,000 tons, and, while this average was lower than the 1920 average monthly record of 96,000 tons, it was greater than the corresponding figures for 1922 and 1921, when the average monthly outputs were 39,000 tons and 55,000 tons respectively. The total production of ingots this year was 749,270 tons. For the first ten months of the two preceding years the outputs of ingots were 370,836 tons in 1922 and 530,315 tons in 1921.

Credit Bureau Cuts Down Plumbers' Losses Through Bad Debts

Well Planned System of Records of Bad Debtors Protects all Plumbers in Community by Plan of Interchanging Information—Special Forms Used Through a Central Bureau — Number of Canadian Centres Planning a Similar System

Editor's Note:—Sanitary Engineer recently had an enquiry from a Western sanitary engineer for details concerning the establishment of a local credit bureau in the industry. Knowing of the value of such facilities, and in view of the success with which they are being operated in many places of the United States, information has been secured concerning the best practice of such organizations, through the assistance of the National Trade Extension Bureau, as follows:

A CREDIT bureau should be maintained by every association of plumbing dealers or heating contractors. The purpose of this bureau is the protection of the members from loss of money through bad credits. It consists essentially of an exchange of information among members and a compilation of facts concerning a prospective risk from all available sources. In other lines of business, practically every progressive retailers' association now has such a bureau. Thousands of dollars can be saved to members each year by credit reports on file in the association's office.

A credit bureau should be in direct charge of some certain person, usually the secretary or assistant secretary. Every member should furnish the credit bureau with accurate reports of any "slow pay" or "bad pay" customers. Then, it is customary also to exchange information with other credit rating bureaus, and secure from them information on any person for whom no previous work has been done by members.

Give All Details

Reports on a bad risk should give the name, address, amount, and any other information that might be helpful. It need not be necessary for other members of the association to know which member reported any certain person. Each member can be given a number, which is known only to himself and the bureau secretary.

It would be the duty of the person in charge of the credit bureau to file these reports alphabetically for ready reference. After this file is arranged, credit information can be promptly furnished to members of the association.

Some associations operate a collecting agency in connection with the credit bureau to collect bad accounts for their members. A series of collection letters is sent out by the secretary, and when necessary, legal aid is secured. A small

charge is made by the bureau to pay the operating cost of collecting.

1. Every month information blanks are sent to each member of the association by the person in charge of the bureau. Each member goes through his ledgers, and lists on this blank the name and address of each customer whom he considers in any way to be a bad risk. He also fills in the amount owed by the customers, and designates the class by the letters "A" or "B." Class "A" includes accounts not collectable. Class "B" includes those that are more than six months old, slow pay, doubtful or risky. Under "Remarks" he

will give any additional information that may be beneficial. As soon as the blank is filled out it is mailed to the person in charge of the bureau.

2. When the person in charge of the bureau receives the information blank, properly filled out, he transfers each name, together with all the information pertaining to the account, to a card, which is then filed alphabetically in a standard size card file. In addition to this information, the card has a space to insert the number of the member who makes the report. In case more than one member reports the same customer each report will be entered on the same

[illegible][illegible]

Form CB 3

Notification card

Mr. _____ Address _____

Your account with _____

This bureau has been successful because of its fairness to all. It is our policy to ascertain if there is a dispute or grievance existing before proceeding with our methods of collection. If you have a complaint or just reason for withholding payment, please call at our office or write us on the back of this card explaining your grievance in full. This should reach us not later than _____ 192____. If you have no reason for withholding payment please oblige us by remitting \$ _____

T. E. B. Credit Bureau
Room 403 Mercantile Bank Bldg.

Above are three of the forms referred to in the article as used in connection with this credit plan. Information blanks as used by the plumber for recording the information required are illustrated along with the Credit File Card, and the Notification Card.

card, as also will be the number of each member reporting. The information blank is then filed in a private file kept by the person in charge of the bureau.

3. Where possible, arrangements are made with some reliable credit agency to secure reports on prospective customers where the bureau does not have a report in its card file. Such reports would be termed special, and a charge of from fifty cents to one dollar would be made to defray expenses.

4. When a customer, who has been reported to the bureau as an undesirable risk, pays up his account, it will be the duty of the member so reporting such customer to notify the person in charge of the bureau that the account has been paid. Then the person in charge of the bureau will make proper notation on report card, and inform all members of the association that such customer has paid up his account. For this purpose it is essential for such an account to be plainly marked (on the ledger sheet) as reported to the credit bureau. Thus, the necessary report to the credit bureau of payment will not be overlooked.

5. Any member desiring information from the bureau will call over the telephone, giving his own name and number, that the bureau may know that he is a member. He will next give the correct (full) name and address of the prospective customer. The bureau will then refer to the card file, and report that John Doe is reported by one or more members as being slow pay, a bad risk, or such other information as may be at hand.

6. In order that the customer who is reported may have an opportunity to justify himself, the person in charge of the bureau will inform such customer immediately that he has been reported as owing certain members of the association. Form CB-3 is used for this purpose, and must be mailed first class in a sealed envelope.

7. In case the customer claims that an adjustment is necessary on account of overcharge, defective material, or inferior workmanship, the person in charge of the bureau proceeds to make an investigation, and if the claim is justifiable he shall endeavor to make the proper adjustment.

8. Should the person in charge of the bureau be unable to make a satisfactory adjustment, he shall immediately form a board of arbitration. This board shall be composed of three members, two of which shall be master plumbers. One member of this board shall be selected by the customer, one by the bureau, and the third shall be selected by the two members of this board shall be selected of this board shall be final.

9. Should there be no claim presented and no response to Form CB-3 within a reasonable time, then the person in charge of the bureau will send out collection letter No. 1, followed by No. 2 and No. 3 if necessary.

10. In case of failure of the foregoing, the person in charge of the bureau will institute legal action as a final effort to collect the bill.

Collection Letter No. 1 to Follow Card Form CB-3

.....192..

Dear Mr.

This morning while going through our Credit Files, we noted that you had made no reply to our statement of192.., calling your attention to your account with Mr. (Co.).

We want to be fair with you, therefore we again ask you to tell us frankly if there is any reason why this bill should not be paid.

It will be to the interest of all concerned for you to write us immediately or drop into our office, and tell us just how you feel about this matter. You will find our attitude to be not only fair but courteous.

We confidently expect a prompt reply to this letter. Do not disappoint us.

Yours for service,

Collection Letter No. 1 which follows card form CB-3, being the Notification Card as illustrated elsewhere, is reproduced here.

Alberta Government Making Experiment of New Heating Types

WINNIPEG.—An interesting experiment in steam heating is being conducted in this city by the Alberta provincial government in the form of a new domestic heating system, designed with a view to combining the quick results of steam heating with the lasting qualities of hot water. The plant was designed by George R. Pratt, fuel engineer for the province of Alberta, the idea being to obtain better control of temperatures of various parts of the house and to obtain more heat from the steam than is usual when bringing in steam from an outside source.

The plant has been operating for about five weeks and results show every satisfaction, according to those conducting the experiment.

Another experiment run in conjunction with this one is a new type of steam or hot water boiler, designed for quick heat from a small quantity of fuel, such as is desirable in the spring and fall, when it is desired to heat up one or more rooms without heating up the rest of the house, or to provide equal results with the regular heating system to that obtained by electrical heaters.

The boiler installed is for steam and demonstrates that steam can be raised in five minutes from a cold boiler. It

is reasonable to expect that hot water can be raised much more quickly. In conjunction with the boiler is a new type of furnace, by which it is hoped to maintain service with slack coal or coal containing a large portion of slack.

ARENA PROVIDED BIG JOB

In Port Arthur's new civic hockey arena and skating rink, which will be completed in December, nine reinforced arches, 110 feet long, were raised to support the roof. Each arch in addition to several hundred feet of British Columbia fir timbers, contains eight tons of iron rods. Much other steel and iron is used throughout the structure. The arched roof does away with the necessity of using uprights which block the view of spectators over the ice sheet.

WILL EXTEND ASSOCIATION'S SCOPE

Montreal.—Plans have been outlined by the Merchants' Association of Montreal whereby that body will organize a retail credit bureau, wherein credit information would be given on individuals looking for credit in Montreal. At the first meeting of the newly-elected board of directors, Adelard Fortier was chosen as president for a second term. H. J. Elliott, K.C., was elected first vice-president; J. C. Copping, second vice-president; E. W. Sayer and J. O. Boucier as additional members of the executive committee of five.

Heating and Ventilating Department

Principles of Heating and Ventilation of Factories

Determination of Heat Losses—Air Leakage—
Steam and Hot Water Heating—Removal of Air
in Steam Systems

By H. H. ANGUS, Consulting Engineer

IN ORDER to get a correct view of this subject, it is advisable to start at the heat losses from buildings and then describe the method of taking care of these and later the ventilation requirements for various buildings.

The first item to consider is the heat losses. These losses depend on the size, shape and location of the building, also its use and construction. The old rule-of-thumb methods are not sufficiently reliable for use on buildings of any size and may only be used as checks. We must first decide the temperature to be maintained inside the building, which for general factory work, is usually about 60 deg., but this depends on the nature of the work. Such work as type-setting requires a temperature of 70 deg., which is also the case in factories where the work is very light and the operators are seated at benches, such as in jewellery manufacturing. In one factory different processes often require different temperatures.

The outside temperature and the velocity and direction of the prevailing winds may be secured from the observatory records. While the heating system must be sufficient to care for the coldest weather, it is not advisable to use the minimum temperature in making calculations. The low temperatures do not usually last more than a day or so and it requires two or three days for the average factory building to get cooled down inside. If the minimum average for three days is used, it will be found that the heating system is sufficient. For example, in Toronto we have had temperatures as low as 26 deg. Fahr. below zero, but this low temperature does not last usually more than a day. The average low temperature for a period of three days is not usually much below zero, so that in this vicinity a heating system is usually designed for an outside temperature of zero or 5 deg. below. This is usually ample if the building is kept warm all the time.

Knowing now the inside and outside temperatures, we can get the difference between them. In Toronto and vicinity this would be probably 60 deg. Fahr. for shop sections and 70 deg. Fahr. for office sections. It is interesting to note that this changes within a comparatively short distance from the city.

The losses of heat in B.t.u. per square foot per degree difference for various materials used in construction has been gone into fairly well by a number of authorities who have made actual tests on sample walls, roof, etc. There is some considerable difference in the factors for the same construction due to a great extent to the fact that no sample walls are built in exactly the same way. New tests are constantly being made, however, so that agreement on certain constants will, no doubt, soon be reached. Tests made cover a great variety of construction of walls, roofs, windows, etc.

Having now the difference in temperatures inside and outside, and the heat losses per square foot, we are able to figure out the heat losses for the building, except that due to air infiltration. For example, the constant for single glass windows with good sash is 1, and if we have a factory in Toronto with 1,000 square feet of exposed glass, the loss through the glass will be 60 x constant 1 x area 1,000 or 60,000 B.t.u. per hour. In a similar way the losses through roof, floors, walls, etc., are calculated and we get the total loss from the building except that due to air leakage. The losses should be multiplied by a factor dependent on exposure. For north walls, for instance, it is usual to add 25 per cent. and less for other exposures, but these factors depend to a great extent on the location of the building in relation to others.

Air Leakage

Now to get at the loss due to air leakage, we have several factors to consider. If the building covers a considerable area and is good construction, it is sufficient to allow for a half of one complete air change per hour. This means

that one half of the air contents of the building must be replaced by heated air every half hour. This air change varies from $\frac{1}{2}$ to 1, and sometimes more than that for narrow buildings with great exposure. This change, of course, depends on the wind velocity as well as other factors, but it is unusual in most places to have a strong wind during extreme cold weather. Another method used to figure air losses is to assume that all air comes in through cracks around the windows. Knowing the construction of the windows and building, we assume various widths of cracks around the windows and by multiplying these by the perimeter of the windows and the velocity of the air, we arrive at an air change. As both methods depend to a great extent on experience and judgment, there is little to choose between them. The losses due to the air change are the only losses which cannot be calculated accurately, although experiments are now under way to determine these by experimenting with rooms of different construction. Having decided the air leakage per hour and knowing the specific heat of air, we can easily calculate the heat loss due to air infiltration.

By totaling all losses, we now know the total loss of heat from the building which must be replaced by the heating system. It is probable that as the cost of coal advances, more attention will be given to the best construction for heat insulation.

We now have the heat losses from the building and the question is how to replace them. If the factory has a large number of motors, or other sources of power, we can take the heat developed from these from our heat losses, as the power turns to heat energy. We have also the heat given off by human beings. This amounts to about 400 B.t.u. per hour per person, and the effect is very noticeable in such buildings as theatres, which require no heat after the audience arrives. These sources of heat are usually negligible for factories, although in textile factories they are well worth figuring. There may be other sources of heat, depending on the work being carried on. Unless the process is continuous, however, these sources of heat should not reduce the size of the heating apparatus, as the average factory is closed from noon Saturday till Monday morning. They will, however, reduce the demand on the heating apparatus during working hours and reduce the coal required per year.

Methods of Heating

It would be possible to provide the necessary heat by means of stoves lo-

(Continued on page 28)

Gravity hot water and gravity air systems are limited to smaller factories. For medium and large factories we have: 1. The blower system; 2. steam heating; 3. forced hot water. Each has certain advantages and disadvantages which are discussed in this article.

Questions and Answers Regarding Plumbing and Heating Practice

How Can a Range Boiler be Installed Horizontally in Ceiling of Basement?

Editor, Sanitary Engineer:

Will you please have your technical editor explain to me the best way to instal a 30-gallon range boiler at the ceiling of the basement in a horizontal way, as the cellar is small and low, particularly so where I would like to instal it, near the pipeless furnace. I also wish to instal a coil of $\frac{3}{4}$ -inch pipe for the purpose of heating my office. How would I connect this up to a 30-gallon boiler so as to procure hot water at the faucets in the regular way? I also thought of placing the boiler under the office so as to have the floor warmed. Please advise if it would be better to put the range boiler near to the furnace. I am sending sketch of the way the cellar is arranged. —A. O. S., NICOLET, P. Q.

Answer:—In reply to above questions we have not reproduced the cellar plan, but the accompanying sketch will give the desired information. There are several details to bear in mind. First, that no range boiler can under all conditions

give satisfactory service unless the boiler is specially lapped, and, as the sketch sent in by our inquirer leads us to believe that he purposes using a regular range boiler, we have arranged the connections of piping in the best manner possible.

Next, all the horizontal pipes must be installed with a pitch toward the boiler and to the coil, and we would like to suggest that one-inch pipe be used for the heating coil. It will be well to use a one-inch nipple and bull head tee at the lower portion of the boiler, this tee to be connected just as shown, so that there is no interference with steady and unrestricted circulation. As a matter of fact, one-inch pipe throughout between the furnace and the range boiler would be better, then simply take $\frac{3}{4}$ -inch pipe from one end of the tee referred to and use $\frac{3}{4}$ pipe to the coil or radiation.

Between the boiler and the coil $\frac{3}{4}$ inch would be quite in order on the flow

and hot water supply pipes to the plumbing fixtures.

The cold water supply pipe will be O. K. if $\frac{1}{2}$ inch size is used. At the same time, the piece of bent pipe on the hot water should by all means be $\frac{3}{4}$ inch. Cold water, $\frac{1}{2}$ in. will be quite in order.

The reason why a trap is shown on the lower pipe at the furnace is so that any sediment, which is very likely to collect, can be easily drawn off and thereby prevent the possibility of the coil in the furnace getting choked up. It is advisable to use the faucet quite frequently so as to keep this pipe clean, and ensure greater satisfaction, due to clearer circulation. — TECHNICAL EDITOR.

Can Flush Valves Be Fitted to Pneumatic Water Systems?

Editor Sanitary Engineer.—I am paying more interest to the installing of farm water supply systems and rural sanitation and have been asked if the regular flush valves can be fitted up to a farm water supply system. One of my prospective customers has heard of

several water closet tanks leaking, and has seen these flush valves in operation in some of the hotels.

If these valves can be used, will you please give some information about them, and how they should be connected to a pressure system such as referred to?

—F. W. H. O.

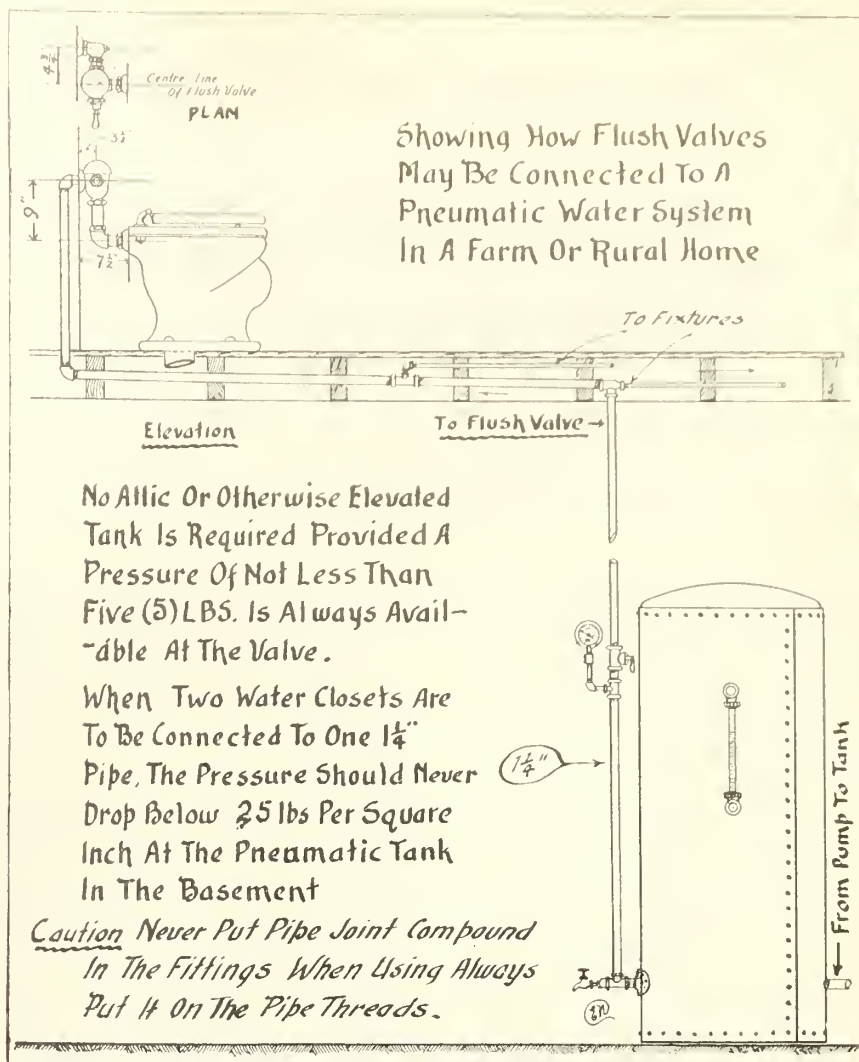

Answer.—It is encouraging to learn that still another reader of Sanitary Engineer is going to devote more time to installing plumbing in farm homes. The question of connecting flush valves direct to a pneumatic system is perfectly O.K. The pressure system is doing the same work as a regular city water works will do, and should be fitted up in the very same manner. There is one point which must always be given consideration, viz.—that the outlet from the pneumatic tank must be enlarged or rather the tapping must be ordered when the pressure tank is going to be used for such a purpose. Ordinarily these tanks are not tapped much larger than $\frac{3}{4}$ inch, and for flush valves a one and one quarter inch tapping at the outlet would be necessary.

When such a size is connected into the tank, almost any number of smaller branches may be taken off to be used to furnish water for the other fixtures of the house or other buildings.

The writer knows of a public school where W. C. tanks were installed chiefly on a basis of cheapness, but the plumber declared that flush valves could not be used, which proved that he evidently had not kept himself posted as to what was going on.

The accompanying illustration gives our readers an idea how flush valves may be used on pressure jobs out in the country.

TECHNICAL EDITOR

This sketch illustrates how flush valves may be used in pressure jobs out in the country, as referred to in accompanying article.

Travellers Should Avoid Wasting Merchants' Time

WORTHY of the attention of all manufacturers and wholesalers who have travellers calling upon retail merchants is the following extract from a letter received from a Western Ontario merchant:—

"Is there any easy way in which the following matter could be placed before the wholesalers and manufacturers? We have been in business for forty years and every business day throughout that length of period we have been interviewed by one or several travellers representing the many firms. We are always glad to see them, and make it a special point to be courteous, but as brief as possible. We find, as a general rule, that the average traveller is not sufficiently clear cut and sharp in the introduction of his goods, but desires to talk about a lot of other matters be-

fore coming to the real issue. The days of offering the buyer a cigar, drink or chromo are dead, and we feel that the days of the traveller desiring to tell a story or discuss the weather, with a lot of other trifles, are also dead. Merchants are busy men, or should be, and we feel that the traveller's conversation should commence about as follows: 'Good morning, Mr. Smith. My name is Jones, representing John Wilson & Co.' The average merchant has so many travellers calling upon him that he becomes confused as to what firm these travellers represent, and particularly so when occasionally such travellers change their positions.

"Please let this point be firmly established that the merchant needs the traveller and should be courteous, and the traveller should be brief."

AMALGAMATE BUSINESS MEN'S ASSOCIATIONS

Toronto.—Plans now under way, when completed, will give the Bloor Business Men's Association the honor of being the largest association of its kind in the city. These plans include the amalgamation of the Bloor-Bathurst Business Men's Association, the Bloor-Dovercourt Business Men's Association, and the Bloor-Lansdowne Business Men's Association, into one body with an initial membership of over seven hundred.

BRITISH STEEL TRADE MAINTAINING ITS AVERAGE

October iron and steel exports from Great Britain, 388,599 long tons, were the largest thus far recorded in 1923, with the exception of May. Imports, 106,262 tons, approximated the figures for the second quarter, but were lower than the monthly average for the first nine months.

Tinsmithing and Sheet Metal Work

Sheet Metal Men Should Work Out Patterns of Cornice and Skylight Examples Found on Schools and Hotels

Sketches and Designs Made in This Way are Good Practice, as They Hasten Experience and Produce Creative Energy

Written for Sanitary Engineer by O. W. KOTHE, Principal, St. Louis Technical Institute.

IN ARCHITECTURAL cornice work and the making of gables and pediments, the panel thus formed is often enriched by various designs of ornament. Some of these are made one way and some another, and in this case we shall show that an irregularly curved design is difficult to develop. The purpose of these ornaments is to fill the blank panel space so that in each half of the panel there may be four or six of these designs, each one being of a different length and curvature. This requires each element to be treated separately, and judging for both halves there would be two ornaments made of each pattern. Workmen who are skilled in raising zinc or copper could, no doubt, make this crease with little difficulty, while others would have trouble, but where the ornament is to be made of galvanized iron, it really must be developed in triangulation.

The first step is to describe the centre post and then in their proper position sketch in each ornament. This is a matter of trial, as each element must be put in by "feeling" rather than by stiff formal description. This is not an easy matter and may require considerable rubber for erasing before graceful curvatures are determined upon. When the outlines are established, the centre line is filled in to harmonize with the design. Some workmen may prefer to sketch in the centre line first and then to work the outline around the centre line, which practice is all right as long as the proper result is produced and a proper division of space is made between the various elements of the ornament. Another feature of this ornament is that the rise in the centre line varies, it being a quarter inch high at the centre post and gradually raises to three-quarters and then works down to zero at the point. This requires a special girth developed along the centre line.

So, we first divide all three lines into the same number of equal parts, or at least to such a disposition that will make convenient development and overcome

confusion of lines as well as not take too long in development. After this, lines are drawn from one point to another, as shown. The heavy dotted positions in the plain view represent the section showing the variation in the rise of the centre line from which the diagram is constructed.

We pick each space of the centre line as 0-1-3-5-7, etc., to 39 and transfer them on a straight line, as in the lower diagram. Then from each point we erect lines, as at 5, 17, 29 and 39, and measure the specified altitude, as shown. At their points we sketch in the top curve making it as uniform as possible, which will be the top centre line straightened out. After this, we erect all the other lines from the base line to this curve and that gives us the height or

altitudes for the triangles under development. In this case we only develop the lower or inside strake of ornament, so we pick the triangular lines from plan, as 1-2, and set it from the base line over as shown, then 1-2 will be the true length. In the same way we pick lines 2-3 and use point 3 in base line and mark the line 3, then 3-3 will be the true length. In this way the vertical lines in our diagram will always be the altitudinal line corresponding to the centre line of our plan, and we set off these triangular plan lines on each side and develop the pattern simultaneously so as to avoid marking points in lines. In this way we start from the point 0 and use 0-1 from diagram as girth, and also 0-2 from plan as girth. Then with true lengths 1-2 from diagram and 0 as centre cross arcs in point 1. This gives us the start for triangulating the rest of the strake. The girth spaces for the lower side are all taken from plan in numerical order, while those from the upper side of strake are taken from the diagram.

The outer strake for pattern would be developed in the same way, but using the girth from the outline of plan as 0-2-4-6-8, etc., while using the girth as 0-1-3-5-7, etc., from diagram for the centre line. In this way the girth alone, the centre line of both inside and outside strakes, will be of equal length.

Working Drawing Shows How Pattern for Gable and Pediment Ornaments to Fill Blank Spaces Are Made.

Ordinarily a small lap would be allowed on one of the strakes similar as "A," "B," "C," "D" show. If time to be put in on them permits, the ornaments could be made as "E," although we believe by the time the workman has laid them off he can feel that sufficient work had been put in on them.

Some architects are rather particular about having the things they design worked out accurately and in such cases their whims must be catered to, other-

wise in the future such architects will specify substitute material on the grounds that the sheet metal man says it is impracticable to make the fine designs the architect specifies.

One of the troubles with sheet metal cornice work is to make absolutely perfect mouldings by the hand cornice work. That is also why some architects say that sheet metal work cannot be shaped as they want it, and, therefore, they specify something else.

Necessity Often Requires a Connection Where a Tee Will Intersect an End Pipe Off Center

The Connection May Be on the Top or Bottom Tangent, and the Pattern Shows How this Can Be Done

NOW and then it is necessary by the run of pipes to make a connection where a tee will intersect an end pipe either on the bottom or on the top tangent. In that case the method here shown can be followed. At first we draw the plan describing the main pipe to suit the required diameter and then set the branch pipe on this main pipe wherever measurements require. Then describe the half section "A" and divide in any number of equal parts. From here extend lines into the main pipe, thereby intersecting, as at points 4-3-2-1, etc. Now, from these points we drop lines and set up a side elevation. The angle of tee in the side elevation is generally made 45 deg. or can be made anything desired or required. Reproduce section "A" with all its points, as section "B," and from each of these points extend lines into the main pipe until they intersect lines of similar number dropped from plan.

Pick out these intersections and sketch the miter line as shown, which is the points of penetration between the tee and the main pipe. Now to set off the pattern for the branch, extend the line 1-1, as 4-4 in the pattern, and on this set off twice the number of spaces you have in the half section "B." Draw stretchout lines from each of these points so they are parallel with the tee branch and then from each point in the miter line of elevation project lines into the stretchout. Pick out the intersections of corresponding lines and sketch a line through these points, and you have the miter line.

When the opening is desired, observe that the branch pipe sets over the main pipe a distance of 4-1-4 of plan, so that these spaces are picked separately and set as 4-4 in the pattern to the left of the elevation. Then drop stretchout lines, and from each point in miter line of elevation bring over horizontal lines to intersect the stretchout lines of similar number. Through these intersections sketch the outline for opening, and

the pattern is finished. Observe that the plan gives the width or girth, while the elevation gives length of cut. So,

Pattern Shows How to Make a Connection Where Tee Will Intersect an End Pipe Either on Bottom or on Top Tangent.

by working these two together in this way, we make the pattern. Add edges for assembling on all patterns.

Investigation Into Central Heating Will Cover Much Territory

OTTAWA.—Consistent with its recently adopted policy of doing everything possible toward the securing of a permanent solution of the fuel problem, the Dominion Government, as announced in the Nov. 15 issue of Sanitary Engineer, has engaged F. A. Combe, prominent Montreal heating and combustion engineer, to make an exhaustive survey and report on the feasibility of establishing central heating plants in Canada.

Contracts Awarded

Hamilton—Wm. Newell has the plumbing contract and Charles Havers the heating contract for three residences being built on Tuxedo Ave., by Witt, Bull & Oxford.

Hamilton—McMillan & Ford have the plumbing contract and M. Williamson, Cluny Ave., the heating contract on two residences, \$4,000 each, on Cluny Ave., by S. Washington.

Kitchener, Ont.—Battler & Freiburger have the plumbing and heating contracts for \$5,000 residence, being erected on Locust St., by H. Allen.

Montreal.—J. E. Mayer has the roofing contract and A. Blais the plumbing and heating contracts on two residences, \$15,000 each, being built on Cote St. Antoine, near Wilson.

Ottawa—Gervin & Hodgins have the plumbing contract and Pease Foundry Co., the heating contract on \$7,000 residence being built on Somerset St. Gervin and Hodgins also have the plumbing on a \$6,000 residence on Ossington Ave., on which the Capital Hardware Co. has the heating.

Birchcliffe, Ont.—The Toronto Furnace Co., 35 Golden Ave., has the heating contract for two residences being built at 180 King Edward Ave., \$4,500 each, by A. Flatman.

Mr. Combe's investigation will be conducted under the supervision of the Dominion Fuel Board and must be completed within six months. He will not only deal with the history of central heating, but will also pay particular attention to the saving that can be effected by using low grade fuels in central station heating plants. Other phases of the subject to be dealt with will be reasons for the failure in unsuccessful central heating enterprises, the possibility of combining electric generating and heating service, using plants for making ice in summer, diagrams and plans of plants, rates, regulations, approximate costs, capital required and probable profits.

Mr. Combe is chairman of the fuel committee of the Engineering Institute of Canada. He has for years specialized in central heating work.

Vol. XVII DECEMBER 1, 1923 No. 23

Moral Codes in Business

SOME very high ideals were prescribed for the business of a certain branch of wholesale trade at a recent convention in Toronto. The members were urged as a body to help "purge the trade of the immoral business crook, the cowardly secret rebater and the dishonest price cutter, if we cannot make them honest." The president urged that the wholesaler should give a declaration to the manufacturer that he has not sold products at lower prices or on better terms and conditions than provided for, and also that employes of wholesalers should also give a declaration. This policy would, it was thought, put an end to dishonest practices. It was the feeling that with the manufacturers' contract selling plan firmly established there would be no extensive secret price cutting, the public would be more honestly dealt with and the standard of business morals would be greatly improved. The statement was made that the Dominion government itself favored fixed prices and their honest observance.

There is a good deal to be said on each side of a number of these points, all not being agreed that the fixing of prices and establishment of contract selling plans will do much to increase business honesty. It is a fact that the more rules and regulations that are established, the more such rules will be broken. Anything approaching agreements must be dealt with the one idea of most economical distribution, best service to the trade and lowest prices to the consumer consistent with fair profits. There is need for the development of better business morals in connection with some branches of trade, even in the plumbing business, but as a general rule definite dishonesty is short lived and the type of ignorance which begets destructive competition is usually short lived. Hence any such irregularities generally solve themselves in short order. If they can be eliminated almost entirely by the establishment of a higher moral code, then let us have it quick.

More Show Windows

THE outstanding success which has attended the Royal Winter Fair, just concluding its second annual renewal in Toronto, is a further indication of the increasing importance of such exhibitions and a complete vindication of the principles of advertising and of actually showing the goods, principles which are the fundamentals of retail business.

In opening the Fair, Premier Ferguson, of Ontario, stated: "Canada is rapidly learning to employ these two out-

standing factors in her development—Education and Advertising. These are being recognized to-day as never before and utilized in the onward march of progress. The exhibition employs both in the fullest measure. We cannot have too many show windows. Such Fairs constitute one of the most valuable and useful institutions which exist in Canada to-day."

Progressive retailers have learned the value of their show windows, and any who have not placed on them their rightful value have only to recognize that millions of dollars are being spent on exhibitions of various kinds merely to dress a show window which will influence people along certain lines. The retailer has show windows which in a year's time can be utilized to influence many thousands of people.

Mail-order houses and numerous other forms of competition for the retailer have none of these great advantages and care should be taken to see that they are put to the best possible use.

Don't Know Where They're At

IT IS unfortunate that plumbing and heating operators and tinsmiths are not able, at this late date, to get definite instructions as to their responsibility under the new sales tax regulations becoming effective on Jan. 1 next. Elsewhere in this issue appears information secured by Sanitary Engineer from officials of the tax department which shows that plumbers or tinsmiths doing over \$10,000 business in the last fiscal year, representing materials assembled or produced, will be licensed and will collect sales tax on sales and make returns to the government. This will be a new role for most plumbers, though some tinsmiths have been tax collectors for the government under the present regulations.

Plumbers in this category will, therefore, be known as licensed manufacturers, and it is likely that sales of bathroom appliances and other goods which are sold in the same form as when purchased will be classed as retail sales and not influence the \$10,000 sum which establishes the status of the plumber for taxation. It is apparent that the wholesaler or manufacturer selling to the plumbing trade will require two sets of prices, because there will be both licensed and unlicensed plumbers, the former in buying at prices not inclusive of sales tax and the latter buying at prices including tax.

Manufacturers and licensed wholesalers will apparently have less work under the new regulations, for on all sales to licensed plumbers, no tax will be applied by them. One would imagine that this change of policy in collecting tax would greatly increase the number of firms from which the government will be collecting tax, but, though many trades are licensed for the first time, there is a reduction in the number of firms which will collect sales tax. This is due chiefly to the elimination of many wholesalers.

There is already talk of increased prices on plumbing and heating supplies, due to the increased sales tax, but there would seem to be little justification for increases beyond these, due to the fact that in future the tax must in most cases be included in the price and not shown as a separate charge. In some trades, the sales tax has been held responsible for large increases in prices already in effect, and such action has been resented by the trade, for it proves a big handicap to business under present conditions.

Novel Scheme of Apprenticeship

APPRENTICESHIP is one of the big problems of the industry in Canada which is receiving much attention at present. In this connection the plan to be followed by a new school being formed in Buffalo is interesting, containing as it does some ideas which might be used in Canada to advantage.

According to the plan, an advisory committee will be constituted of representatives from the journeymen's organizations and representatives from the Department of Education. This advisory committee will offer suggestions on the content of a course of study for the plumbing school. It will set certain standards of work to which every boy must comply before he can receive the diploma of the school in the two-year day trade course in plumbing. The advisory committee will aid in the development of the program through the discussion of questions and problems as they arise. Through frequent visitations of the school, the committee will keep in touch with the work that is being done.

The advisory committee recommended an instructor who was recognized by the Master Plumbers' Association as an excellent mechanic, and was therefore chosen by the Board of Education.

Members of the Master Plumbers' Association have been requested to agree to employ boys who are graduated from the school, allowing each graduate credit of one year on his apprenticeship time for the two years which he spent in school. The master plumbers have been asked to agree to give employment to every apprentice for at least ten months of every year, and to establish a scale of wages for apprenticeship based on a percentage proportion of the journeymen's wage in the city.

The master plumbers have been asked to appoint an apprenticeship committee to assist in the establishment of a course of study, to work in setting up a definite standard of work for the attainment of each boy before graduation, and to work out the details of his indenture or apprenticeship agreement protective to both employer and apprentice.

In order to enter the vocational school for plumbers, the boy must be an eighth grade graduate and hence is at least sixteen years of age when he completes his two-year trade course.

Every boy who is employed following graduation from a vocational school must attend evening school during his apprenticeship. This is with the co-operation of the employer and the union, and keeps the boy under the influence of the school as long as possible and gives him practical training in advanced trade practices.

Time and Labor Control Your Costs

Minute Message No. 40

Written for Sanitary Engineer by FRANK STOCKDALE

Buying Series

THE first essential to good buying is a knowledge of the things that increase the cost of carrying and selling the goods.

Two questions the buyer should ask about every article he buys are these:—

1. Are the goods hard to sell?
2. Will they stay long in the store?

The harder goods are to sell, the more the labor cost, and the longer they stay in the store, the higher the carrying cost.

Every item bought must bear a margin in proportion to these costs. It is not enough to select goods of good quality, at fair price. The cost to sell and the cost to carry must be given careful consideration. Not only this, but the wise buyer considers these two things separately.

It is easy to make mistakes by assuming that easy sellers are quick movers, or that quick movers are easy sellers. Sometimes they are not, and a few mistakes may consume all the profits made on other items.

Watch "Father Time" and "Labor." They control your cost of doing business on each line and item.

News Notes From Coast to Coast

Doings in the Plumbing and Heating Industry

NEED NEW VENTILATING SYSTEM

St. Thomas, Ont.—It was pointed out at a recent meeting of the Board of Education that a new ventilating system will have to be installed at the Myrtle Street School before the heating system will work satisfactorily.

RETURNS FROM CONVENTION

Hamilton, Ont.—City Engineer McFaul has returned from the convention of the American Society for Municipal Improvements, held at Atlanta, Georgia, where two of the big topics taken up were sewage disposal and waterworks extension.

OBITUARY

Montreal.—John Dixon Raitt, aged 80 years, a native of Lachute, and for the past 18 years a resident of Montreal, died at his home here, after a brief illness. Mr. Raitt was for a long time in business at Lachute as a tinsmith, plumber, and roofer, and was a member of the firm of Madden and Raitt.

MAY SECURE TWO COMFORT STATIONS

Vancouver.—Mount Pleasant will be provided with two sanitary conveniences out of funds originally destined to finance the comfort station planned for Georgia St., if suggestions made by aldermen to the civic health committee are adopted, the change arising out of a petition from Mount Pleasant business men.

SASKATOON SANATORIUM CONTRACTS LET

Saskatoon, Sask.—The provincial government has awarded the general contract on the new sanatorium here to Smith Bros. and Wilson, of Regina, this firm's tender being \$181,000 for their share of the work. The plumbing and heating will be done by the Northern Plumbing Co., Saskatoon, who tendered at \$77,767. Eight other plumbing and heating firms tendered, running as much as \$11,000 above the accepted figure.

WILL BAR VENTLESS GAS STOVES

Lethbridge, Alta.—The city council has instructed the city solicitor to prepare a by-law governing the installation of gas stoves, the same to be based upon the Calgary by-law which prohibits the installation of ventless gas stoves. This action was based largely upon a report prepared on this subject by Acting City Engineer Chapman, of Calgary, in which he claimed that the ventless gas stove was scientifically unsound from a ventilation engineer's viewpoint.

NEW MONTREAL REPRESENTATIVE

Montreal.—J. A. Rheame, of this city, has become associated with the Lord & Burnham Co., as their district representative, it being the intention of the company to open a warehouse here for the supplying of Burnham boilers to local customers. Mr. Rheame has had long experience in the boiler and radiator business, having been for the past thirteen years Montreal representative of the Dominion Radiator Co., and for the fourteen years previous associated with H. R. Ives Co., boiler manufacturers.

START CONSTRUCTION AS RELIEF WORK

London, Ont.—City Engineer W. H. Neil has been advised that the Provincial Board of Health has approved plans for the construction of a \$200,000 sanitary sewer to serve the Wellington and High Street district in South London. The work will be done as relief for unemployed, the normal cost being assessable against the properties benefited and the excess, due to winter work will be paid for out of a special relief fund.

AIM TO SUPERVISE OIL HEATING PLANTS

Montreal.—In order to supervise the installation and operation of oil-heating plants, which have become quite numerous within the past few years, the city is considering the adoption of a by-law which will rigidly control the apparatus and fire precautions which must be taken in connection with their use. Oil tanks will have to be placed underground, strict inspection of all equipment will be enforced, and only approved types of tanks, piping, valves, and gauges, will be used.

PREDICTS BIG FUTURE FOR GAS HEATING

Victoria, B. C.—That the future would see community and home heating accomplished by means of gas, instead of hard fuel was the prediction of F. H. Hewlings, speaking before the Kiwanis Club recently. Civilization was approaching a gaseous age, due to the relatively high efficiency of gas for heating purposes, against that of hard fuel, such as coal and wood, he stated. He maintained that furnaces, gas-heated, acted with a greater degree of efficiency and with half the attendant labor.

OBITUARY

Toronto.—David Robb, of the firm of D. Robb & Sons, sheet metal workers, 191 Adelaide St., West, died suddenly at his residence here in his eightieth year. Mr. Robb was an old resident of Toronto, coming here from Kirkaldy, Scotland, 57 years ago.

McCLARYS' WIN OPENING GAME

London, Ont.—In the opening game of the Manufacturers' League, McClarys' basketball team was successful in winning from the McCormick team after a hard fought game.

PRESENTATION TO RETIRING ASSOCIATE

Hamilton.—The office and factory staffs of the Hamilton Stove and Heater Co. bade farewell to Chester Smith, retiring chief clerk of the sales department, by making him the recipient of a sterling silver pencil and fountain pen. Mr. Smith has been connected with the firm for over eleven years in various capacities.

SALESMAN INJURED IN MOTOR ACCIDENT

Toronto.—Lawrence McGaughey, of the sales staff of the Sheet Metal Products Co., met with a serious accident while motoring near Lindsay, Ont., his home town, on Sunday. The car overturned, Mr. McGaughey being pinned underneath, his chest being badly crushed. He was taken to a private hospital at Little Britain, where he is being attended. Examination has revealed that, although much bruised, there was no fracture or broken bones. While Mr. McGaughey is incapacitated, his territory is being taken care of by Carson Teskey.

JAPAN WILL SPEND HALF BILLION DOLLARS

Conditions in Japan are gradually becoming settled. Military law has been discontinued in the devastated region and sufficient houses have been provided to shelter the homeless. The combined adverse trade balances of September and October were by far less than the balance of any one month of 1923, preceding the disaster. It is unofficially estimated that total reconstruction expenditures during the next five years will reach only \$525,000,000. The importation of iron and steel and lumber during October was very heavy. Shipping facilities at Yokohama are being improved rapidly and considerable silk was exported from that port during the month.

British Industries Fair Will be Later in 1924

A NNOUCEMENT has been made by the Department of Overseas Trade of the alteration of date in the holding of the annual British Industries Fair for 1924.

For the past nine years the Fair has been held regularly during the latter half of February, occasionally running on into the first week of March. The next, the tenth Fair, will be held two months later, from April 28 to May 9, and the Birmingham section, instead of being concurrent with or overlapping the London section, as has been the case in previous years, will follow, opening on May 12 and closing on May 23.

The secretary writes as follows: "With the Imperial Conference and its important blood-brother, the Economic Conference, in session, the consideration of the commercial world is concentrated on the question of the expansion of Imperial trade. The present condition of the world's markets is also exerting pressure in the same direction. The political uncertainty and financial confusion of the continent of Europe as a whole is compelling the British manufacturer to give his fullest attention to the requirements and conditions of the Dominions and colonial markets, while the Imperial overseas producer can find few safe outlets in Europe beyond the United Kingdom."

PLANT CLOSED DOWN

St Catharines, Ont.—The Canadian Furnaces closed down their plant for an indefinite period owing to there being little demand for their production of pig iron. Some hundred employees are affected, only a few hands being retained temporarily.

BUILDERS TO MEET IN WINDSOR

Ottawa.—The annual convention of the Canadian Association of the Building and Construction Industry will be held in Windsor, Ont., Jan. 22 to 25, it was announced by Clarke Reilly, Dominion secretary of the association.

MADE LARGE INSTALLATION

The Lakehead Engineering Co. (J. W. Barnes and Frank Lampshire), Port Arthur, this fall installed several new, direct draft-type, tubular heating boilers, manufactured by the Port Arthur Shipbuilding Co. The boiler, according to type, has from twenty-eight to thirty-two tubes, to conform with various radiating surfaces. Two have been placed in the News-Chronicle plant and one in the new temple recently finished for the Independent Order of Oddfellows. The equipment is giving satisfaction and the Lakehead Engineering Co. has several orders pending. Meanwhile, the manufacturers are making arrangements to put the new boiler on the Canadian and United States markets, as many orders are in their hands.

Contracts Awarded

Montreal—Plumbing and heating contracts are to be let by G. H. Robert, 2409 Christophe Colomb, on \$10,000 residence on Villeraie & Berri Streets, of which he is owner and builder.

Montreal—Plumbing work is to be awarded on \$13,000 residence on Blvd. St. Joseph. M. Choquette, 3816 St. Dennis, is the owner.

Toronto—Heating and plumbing contracts are to be let on \$10,000 residence and garage, Dundurn Crescent, C. Tallman, Northcliffe Blvd., owner.

Verdun, P.Q.—Plumbing contract is to be let on \$10,000 residence, Claude St., D. St. Laurent, 1329 Claude St., owner and builder.

Toronto—Plumbing and heating contracts on 6 pair residences, \$7,000, on Orchard View Blvd., Grimshaw Bros., 2033 Yonge St., owners and builders.

Toronto—The plumbing contract is to be let on \$13,000 residence on Second Ave., F. Lusigan, 1491 Wellington St., owner and builder.

Outremont, P.Q.—Plumbing and heating contracts are to be let on three residences, \$14,000, to be built on Outremont, near Van Horne. J. Martineau, 471 Orleans, has the general contract.

Outremont, P. Q.—Roofing, plumbing and heating contracts are to be let on \$15,000 residence, on Querbes, near Lajoie, J. H. Millette, 67 Breboeuf, being the general contractor.

Montreal—Roofing, heating and plumbing contracts are to be let for six flats being built on Wiseman, near Van Horne, at a cost of \$18,000. O. Randeau, 1137 St. Denis St., has the general contract.

Toronto—Plumbing and heating contracts are being let for \$15,000 residence and garage, Indian Grove, near Indian Valley Crescent. Owner, G. S. Sanderson, care W. H. Smith, 291 Indian Road.

Montreal—J. E. Roy, 1426 City Hall Ave., has the plumbing, heating and ventilating contracts on \$60,000 apartment house near 642 McKay St., for M. Maron, 1195 St. Urbain St.

Montreal—J. E. Mayer, 516 Lafontaine Park, has the roofing contract and Tardif & Sarrazin the plumbing and heating contracts on \$9,000 cottage on Dunlop for V. A. Fournier, 2578 Waverley.

St. Catharines, Ont. Bowman Bros. have the plumbing contract on \$4,000 residence at 37 Brock St. for H. N. Dockstader.

Toronto—H. L. Bythell, 897 College St., has the plumbing contract and Robert Steen, 9 Grimthorpe St., the heating contract on \$9,000 residence and garage on Riverside Road.

Toronto—Charles Legg, Barrington Ave., has the plumbing contract and Mason & Allen, 400 Morley Ave., the heating contract on one pair residences, \$8,000, Brookside Drive, near Burgess.

Toronto—H. Cook, 69 Sprucehill Road, has the heating contract and Charles Frampton, 169 Greenwood, the plumbing contract on 3 pair residences, \$6,000 each, on Rhyll, near Haslett Ave.

Sault Ste. Marie, Ont.—J. McLeod has the plumbing contract on \$9,000 store block being built on James St.

Toronto—Feather & Roadhouse, 93 Waverly Road, have the roofing contract and B. J. Miller & Co., the heating contract on \$10,000 garage and office at 365-7 Dupont St.

Toronto—W. J. McGuire Ltd., have the plumbing and heating contracts on \$100,000 manufacturing building east corner Spadina Ave. and Phoebe.

Windsor, Ont.—Welsh Bros., 620 Pitt St. W., have the roofing contract on \$7,000 garage on Church St.

Kitchener, Ont.—H. Klem, 83 King St. E., has the heating and plumbing contracts on \$10,000 residence on Park St., for W. Heberbrandt.

Mount Royal, P.Q.—Edgar Tremblay, 267 Maisonneuve St., has the roofing, plumbing and heating contract on four residences, \$32,000, being built for Model City Housing Co., Montreal.

Montreal—Hickey & Aubut, 93 Dominion St., have the roofing, plumbing and heating contracts in connection with \$15,000 repairs to residence at 595 Pine Ave., for A. Colville. They also have roofing contract on \$20,000 residence on Courte for J. R. Douglas.

Sault Ste. Marie, Ont.—J. McLeod has the plumbing contract and Lockhart Bros. the heating contract for \$9,000 mission for Presbyterian Church.

Sarnia, Ont.—Mackenzie, Milne & Co., have the sheet metal contract for the \$18,000 rink for the Sarnia Curling Club.

Sault Ste. Marie, Ont.—George Woolrich has the heating and plumbing contracts for the \$10,000 store block being built on Queen St. for Harry Yates.

Toronto—E. Lankin & Son, Ltd., have the roofing and sheet metal contracts for the \$50,000 ice plant of Chapman's, Ltd.

Vancouver — The Pacific Sheet Metal Works, of Grenville Island, have been awarded the roofing and sheet metal contracts on the \$550,000 apartment block at Georgia and Hornby Sts.

Vancouver — Campbell & Grill, 1238 Seymour St., have the sheet metal contract and Townsley & Son the plumbing contract on \$9,500 showroom and garage at 1266 Granville St.

F. A. COMBE

Montreal heating and combustion engineer, who has been engaged by the Dominion Government to investigate feasibility of central heating plants.

PRINCIPLES OF HEATING AND VENTILATION

(Continued from page 19)

cated in various parts of the factory, but under present-day conditions of manufacturing, it is advisable to concentrate the heating sources in one location. If we place our heat source in a location convenient for handling coal and ashes, we must use some medium for carrying the heat from this source to the varied parts of the building where heat is required. The mediums at present in use are air, water and steam, although there are many other substances which could be used and may be used in the future.

The next question is how to get the water, steam or air which we use, to carry the heat from the boiler or source to the place where it is required. All these substances expand when heated and, therefore, weigh less per cubic foot when heated than when cold. This forms the basis on which the gravity systems of heating operate. If the heat is to be carried short distances, the gravity systems give good service, but for larger buildings it is necessary to force the movement by mechanical means, so we have the blower system of hot air heating, the forced hot water system and, in case of steam, the vacuum system which pulls on the system instead of pushing, in order to get rid of air which is difficult to handle in steam systems.

We now come to the practical application of the problem. Gravity hot water and gravity air systems are limited to smaller factories, so that for medium and large factories we have the following: First, the blower system; second, steam heating, either gravity or vacuum, and, third, forced hot water. It is possible to heat a factory by any of these systems, but each has advantages and disadvantages which make it more suitable for certain classes of buildings. We will consider them in order.

Blower System

First the blower system. This system is particularly adaptable to large open buildings such as boiler shops and foundries and also to buildings where ventilation is a prime factor. In open high buildings, if a steam or water system is used, the heat tends to concentrate at the roof, even with the radiators at the floor, so that the temperature at the roof of a high building may be 25 or more degrees hotter than at the place where the men are working. This results in high roof losses. For this work a blower system may be placed at the ground level or in the roof trusses and by means of ducts the heated air is carried to a point within a few feet of the ground where it is blown towards the ground and therefore carries the heat where needed. Fans for buildings of this kind are usually fitted with means for recirculating the air so that the fan may draw part of its air from inside of the building and part from outside and the proportions may be adjusted from time to time to suit the requirements of ventilation and heat. This system seems ideal for build-

Heat of human beings is about 400 B.t.u. per hour per person, the effect of which is very noticeable in such buildings as theatres, which require no heat after the audience arrives.

ings where a large amount of ventilation is required. The air is usually heated to about 125 deg. Fahr. in the coldest weather. It may be heated by means of steam coils supplied with steam from a boiler plant or by means of a hot air heater, although the latter seems difficult to make. The blower system has also been used to heat factory buildings with stories not over 12 ft., but in this case the ducts usually take up a lot of room. To overcome this, the ducts have sometimes been run on the roof or under the basement and the air carried down through hollow columns. Hot air systems of this kind give good ventilation but are expensive to operate unless most of the air is used over again.

Steam and Hot Water Heating

For the ordinary factory, consisting of a building several stories high of 12 to 20 ft. each, radiators either of cast iron or pipe coils are usually placed around the outside walls under the windows and supplied with steam or water. There are various methods of piping these systems. The best is the overhead supply system where the steam or water supply main is carried to the ceiling of the top floor and runs around this and the risers pass down through the building and feed the radiators at the top while return risers are connected to the opposite end of the radiators and are run to the basement and connected to a return main running around the basement ceiling or floor. With this system the steam pipes are easily cleared of condensation so the radiators are supplied with fairly dry steam. The same system may be modified by carrying the steam main around the basement ceiling in place of the attic, and in this case the steam flows upward in the risers instead of downwards. For steam systems a single main may be run in the basement and a single riser to each row of radiators. In this case both steam and condensation flow in opposite directions in the same riser, so that this must be bigger. For hot water systems the nearest to this is the one pipe circuit main in the basement with risers and returns run to radiators on the shunt system or the attic supply and basement return and the one-pipe riser.

Generally speaking, all equipment in connection with low pressure heating systems must be made as simple as possible, as these systems are usually operated by poorly paid firemen who have no idea of caring for good apparatus.

These are the main systems, although there are many modifications. In steam systems one of the main difficulties is to get a proper system for removing the air which is heavier than steam. For this purpose, on cheaper systems, air vents operating on the expansion principle are used, and the air let out into the room; on better systems the outlets from the air vents are connected together and a pump or other suction device placed in the boiler room which draws the air to the basement where it is gotten rid of by an air eliminator. For better systems still it is advisable to install a thermostatic trap on the return end of each radiator. This passes both condensation and air, but closes when steam strikes it.

The returns are usually connected to a pump in the basement, which draws back the condensation and air from the system, and after getting rid of the air, forces the condensation back into the boiler. For smaller buildings, this system will work without a pump, unless the radiators are placed in peculiar positions.

In order to bring the cost of installation of a hot water system to about the same level as a good grade steam system, it is usual to place a safety valve on the expansion tank, set at 10 to 15 lbs. This will allow the water to be carried up to about 225 deg. Fahr. without boiling. A pump with 25 or 30 foot head is also used and this allows the use of very small pipe on an ordinary size building. Under these conditions, the size of radiators will be the same as for steam system and the pipe sizes approximately the same, although they may be made considerably smaller.

The boiler plant is practically the same size no matter what system of heating is used. We know how much heat is required to be put into the building and if we add 15 to 20 per cent. to this for supply and return pipes, which are often placed where most of their heat is wasted, we get the amount of heat which must be put into the building.

There are many types of boilers in use at present. If a factory has no use for exhaust or live steam, it is usual to use low pressure boilers suitable for about 15 lbs. pressure. The cheapest boiler is the sectional cast iron boiler. It is less efficient than a steel boiler and will not stand misuse, but if used carefully, it will, no doubt, outlast any steel boiler, as it is much thicker. Of the steel boilers there is the standard horizontal return tubular boiler, which has been used extensively. If these boilers are set with the boiler well above the grates, they will give good satisfaction. Unfortunately, however, it is hard to get bricklayers to make a good job on boiler setting, with the result that in a year or so air leaks in around the fire and spoils the combustion. For this reason steel firebox boilers of the locomotive type have come into use during the last few years and these have internal firebox and are also made to be put up without brick setting so that the danger of a poor brick setting is eliminated.

There is a new boiler of the water tube type now being put on the market which should give good results. It is really the high pressure water tube boiler adapted to small low pressure work. There are also many makes of patented boilers with many unusual features. The average efficiency of heating boilers is about 60 per cent. and there is not so very much difference between the efficiency of cast iron and steel boilers except in the larger sizes.

On good sized plants it is advisable to use at least two boilers, and each of these are designed to carry about 60 per cent. of the total load so that in severe weather it can be forced to carry almost the full load. It is not usual to use mechanical stokers on heating plants except for very large buildings.

Generally speaking, all equipment in connection with low pressure heating systems must be made as simple as possible as these systems are usually operated by firemen who are poorly paid and have no idea of caring for good apparatus. Even the simplest type of a pump or trap is liable to get out of order and necessitate repairs. It is for this reason that in general, down draft boilers with double grates for burning soft coal without smoke have not proved so efficient in use as they appear on test. The firemen change so frequently that it is very difficult to get the fireman to fire these boilers in a correct manner.

While the design of the low pressure heating system is very simple there are a great many put in without any regard to economy of operation and many put in neglecting some of the fundamental principles.

Central Heating Plants

Where we have buildings in groups to be heated, the best method is to instal a central heating plant and carry lines from this through tunnels to each of the buildings and pipe each building as if it had a heating system of its own, except that the boilers, pumps, etc., are omitted. For large factories the boilers should be of the best grade, and automatic stokers used with coal, and ash handling systems. In these large systems it is usual to use high pressure boilers and generate electric power, using the exhaust steam from the engines for the heating system. When a hot water system is used the exhaust steam is used to heat the water in a heater filled with brass tubes, through which the water is pumped, while around them the exhaust steam circulates. This condenses the steam and at the same time creates a slight vacuum. There is usually an auxiliary live steam heater installed to take care of breakdowns and to be used where there is not a sufficient supply of exhaust steam. The water is circulated by means of centrifugal pumps driven usually by steam turbines. On large systems the friction head is often as high as 100 feet and while this requires fairly large driving

(Continued on page 38)

SAFETY FIRST

One should never leave a clock at the head of the stairs, because it sometimes runs down.

A HINT TO HENS

An Ottawa hen laid an egg daily for 107 days. There's a saying in every hen-house that an egg a day keeps the hatchet away.

START A DAIRY

The following Want Ad appeared in the classified columns of the Journal of A.M.A., recently:

Wanted—Married man to milk and drive Ford. Write F. J. B., 721.

HERE YOU ARE, VIRGINIA

Virginia Reel, 8 year old daughter of a Canadian craftsman asks us to print this one so's her brother can have a laugh:

First Flea: "Been on a vacation?"

Second Flea: No, on a tramp."—S. E.

NO SORDID LIMITATIONS

"Rafferty," exclaimed Mr. Dolan, "your boy threw a lump of coal at my boy!"

"That's a Rafferty for you! When he feels there's a principle at stake, he doesn't think of expense."—S. E.

THE LURE OF "FOUR PER CENT."

An excited but dry citizen rushed into the Bay Street branch of the Ontario Government Bank and slapped down a \$50 bill on the cashier's window ledge. "Gimme two cases," he cried. "What?" asked the astonished cashier. "Two cases of what?" "Two cases—this ought to cover it." "What sort of a place do you think this is? And of what do you want two cases?" "Anything—I'll drink it, whatever it is. I saw a sign in your window that you can get four percent. here!"—S. E.

HARDLY PERSUADED

"You don't know what you are missing," the married man told the bachelor. "You don't know what it is to have a wife waiting for you when you return from work."

"No?" the bachelor murmured.

"No," declared the married man. "Think of the joy of working in the garden. Think of the delight children give you."

"Yes," murmured the bachelor.

"Then, if a wife does sometimes get cross or suspicious, you can always talk her out of it."

"I could if I could lie like you can," the bachelor agreed thoughtfully.—S. E.

THE CABBAGE AND THE POT

A Californian and a New Englander were matching stories.

"Why," said the Californian, "we grow cabbage so big that an army of soldiers can camp under one."

"That's nothing," said the New Englander, "we make copper kettles in New England so big that a thousand men can be rivetting one and yet be so far apart they can't hear each other's hammer."

"Go on," said the Californian, "What would anyone use a kettle of that size for?"

"Why, to boil your California cabbage in," said the New Englander.—S. E.

NO CHANCE

"What were your father's last words?" "Father had no last word. Mother was with him to the end."

A GREAT HIT MISSED

Stage Manager—"All ready, run up the curtain."

Stage Hand "Say, what do you think I am, a squirrel?"

SOME DAISY

He was an earnest minister, and on Sunday in the course of a sermon on the significance of little things, said: "The hand which made the mighty heaven made a grain of sand; which made the lofty mountains made a drop of water; which made you made the grass of the field, which made me made a daisy."

CARFARE

For hours they had been together on her front porch. The moon cast its tender beam down on the young and handsome couple who sat strangely far apart. He sighed. She sighed. Finally: "I wish I had money, dear," he said. "I'd travel." Impulsively, she slipped her hand into his; then, rising swiftly, she sped in the house.

Aghast, he looked at his hand. In his palm lay a dime.

A SNAPPY COMEBACK

The secretary had written to a brother that he had advanced the last payment for him, and unless he came across with some coin, he would be suspended. The secretary received the following reply:

"Deer Secceyterry—I got your letter about what I owe you. Now be pachunt. I aint forget you. Plese wate. When sum fools pay me I pay you. If this wuz judgment day and you wuz no more prepared to meet your Maker as I am to meet your account you sure would have to go to h—. Trusting you will do this, I am."

THE BAIRN'S BREEKS

The Duke of Atholl told this story from the Highlands the other day.

"An aristocratic old lady in the Highlands," said the Duke, "hired a crofter's boy as page, and bought him a livery that was to be worn only on very special occasions."

"One day she gave a dinner party. As she entertained her guests in the difficult ten minutes before the meal was served, a tousled head was stuck into the dining-room and the voice of the new page asked: "Please ma'am, am I to wear me ain breeks or yours?"—S. E.

Catalogs and Booklets

Those interested in any of the catalogs described below can procure a copy of the same by writing direct to these firms. Mention that you noticed this in Sanitary Engineer.

ROOF VENTILATOR CATALOG

The new catalog now available which is being issued by Ewart & Son, Ltd., 346-350 Euston Road, London, Eng., contains twenty-eight pages of clearly defined cuts, detailed sketches and complete descriptions.

This catalog covers a wide range of copper roof ventilators with detailed sketches which show the methods of applying them. Many useful hints are also contained in this catalog on ventilation, inlets, air-ducts, air pressure and exhaust ventilation.

The catalog describes numerous styles, designs and sizes of copper ventilators, ventilating turrets, ridge ventilators, concealed roof ventilators, ship and barge ventilators, malthouse cowls, revolving ventilators, fresh air inlets, electric fans and other ventilating accessories.

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

THE outstanding feature of the trade during the last two weeks is the way business is keeping up without the assistance of a great deal of cold weather, which generally aids in stimulating fall trade in heating lines. A substantial amount of contract work is still in progress and each day brings forth much repair work as well as many new installations of new heating equipment. The final volume of heating work which is brought forth each year, with the arrival of continuous cold weather has not yet been realized. This business is generally available when it is realized that defective and insufficient heating apparatus must be corrected, and generally is of a sufficiently large volume to keep the trade very busy for several weeks. Supply houses are now carrying sufficient stocks to cope with this extra amount of business,

which is expected to make its appearance at any time.

Easier prices are in evidence on cast iron pipe fittings, as a result of the very low levels struck by pig iron prices last week. Stiffer prices are noted on black, blue annealed and galvanized sheets as well as on lead and solder.

Many price revisions are expected to be issued for 1924 during the month of December as a result of the new sales tax regulations, which become effective January 1.

Business in the West has been of a slightly lighter nature, which tendency is thought to be but temporary, pending the arrival of colder weather which it is expected will have a stimulating effect on trading in heating lines.

Montreal Markets

MONTREAL, Nov. 29.—Trading in the local market is reported as being fairly active. Good sales in furnaces and other heating equipment have been experienced during the past two weeks. Slightly revised prices are issued on galvanized sheets and Canada plates. Firmer prices are now effective on lead sheets and solders.

The ingot metal markets have been somewhat irregular this week owing to fluctuations in price, and the erratic movements of sterling exchange. Ingot markets are somewhat unsettled owing to the European situation and the outlook is more or less uncertain.

LOWER PRICES ON SOME GALVANIZED SHEETS

Montreal.

Prices on some lines of galvanized sheets show a slight revision this week. Canada plates also show a slight revision. Prices in effect locally are given herewith:

BLACK SHEETS—

PRICES ADVANCE IN LEAD PRODUCTS

Montreal.

Prices have advanced in practically all lines of lead products. In ingot metal markets, lead at the present time is showing considerable strength, and indications from England are to the effect that the present strength will last until the turn of the year at least. Consumption has increased enormously, and the available supply is not sufficient to meet the demand. No relief is coming from Mexico, and indications point to a scarcity of lead in the near future.

Prices on lead sheets and solders all show a slight advance, and are being quoted locally as follows:

LEAD AND ZINC PRODUCTS—

Lead pipe, per 100 lbs., up to 2 in.	14 50
Do., 2 in. to 8 in.	15 50
Do., 8 in. and over.	16 50

COTTON WASTE PRICES FIRMER

Montreal.

Dealers in cotton waste report that sales in this line have been of a fairly active nature for some time past. Prices are firm and are in effect locally as follows.

Former prices are in evidence in southern markets on most lines of cotton goods. Prices of cotton waste have a tendency to be firmer as a result of these high prices.

COTTON WASTES—

UNSETTLED TONE NOTED IN INGOT METAL MARKETS

Montreal.

The metal markets have been somewhat irregular in tone this week, owing to fluctuations in prices, and the erratic movements of sterling exchange. Markets are somewhat unsettled owing to the European situation, and the outlook is more or less uncertain.

TIN.—After a slight reaction last week, this metal has resumed its upward trend and a new high level has been reached. With the sharp recovery of sterling exchange delivery prices have advanced considerably. Local prices are now based on winter freight, which means a higher level of values here. The local market is very strong at 51 cents per pound.

COPPER.—The advance last week in both markets has not been maintained, and prices have fallen back to some extent. Producers having sold a fair tonnage, have more or less withdrawn from the market temporarily. It is probable that fluctuations such as have just taken place will be seen for a time until the market definitely turns upward. Production has to be curtailed still further and consumption increased before a permanent improvement can take place. The local market is quiet at 18½ cents for English, and 18 cents for Chinese.

LEAD.—This metal has been remarkably steady this week, the London price having been the same for several days

and the United States also steady. While prices are high, there is no surplus of lead, but rather a shortage, and no relief can be looked for just yet. The local market is strong at 9 cents per pound.

SPELTER.—This metal has been disappointing, as both markets have declined somewhat, and especially in the United States. In view of the very high figure being paid for ore, it is impossible to produce zinc at present prices at profit, and an improvement should soon be forthcoming. There is no export business in sight as yet, but the erratic tendency of exchange has made this difficult. The local market is quiet at 9½ cents.

ANTIMONY.—The tone of this metal remains quite firm, but the immediate demand has been pretty well satisfied, and there is a tendency to await developments. The outlook remains good, and there is no prospect of an appreciable reduction in price in the near future. The local market is strong at 9 cents for English and 8½ cents for Chinese.

Toronto Markets

TORONTO, Nov. 29.—Trading during the past week has been of a very satisfactory nature, plumbing and steamfitting work having kept up remarkably well as a result of the continued open weather. Jobbing houses report that the fall sale of stoves, furnaces and boilers has been of a substantial nature, and well up to the average.

A number of revisions in price have been made, which include a decline in cast iron pipe fittings, and advances in some galvanized sheet prices, tin plates, and ingot tin and antimony. Pig iron prices declined to a low figure but recovered to some extent. Some cutting is in evidence on sheet zinc prices locally, though the tendency at present in lead and zinc goods prices is toward higher levels. A new list on sink and stove bolts has been adopted in U.S., which includes some higher prices. It is expected that this list will be made effective in Canada in the near future.

REDUCTION IN EFFECT ON PIPE FITTINGS

Toronto.

As a result of heavy declines in pig iron prices locally during the last three months and especially as a result of heavy declines during the past month, a reduction has been made effective in the prices of cast iron pipe fittings.

Cast iron elbows, tees, etc., standard sizes, which formerly took a discount of 10 per cent., now are subject to 20 per cent. off. Plugs, solid, countersunk, standard, are quoted at 20 per cent. off instead of 10 per cent. Bushings now take a 20 per cent. discount in place of 15 per cent., and flanged unions are now being quoted at 15 per cent. off list.

Some price cutting is being noticed in malleable pipe fittings. There has been practically no reduction in basic prices of malleable iron, and formerly quoted prices are in a good many cases still maintained; however, in some cases prices are being quoted in malleable pipe fittings, which will be noted by a

range in discounts given herewith, along with the new cast iron fitting discounts which have been made effective.

PIPE FITTINGS—

FLAT SHEET PRICES SLIGHTLY EASIER

Toronto

Prices have declined on black sheets to the extent of 5c. per 100 lbs. locally. Prices in the United States on this line are not easing off to any extent, as consumers' stocks appear to be low, and there is some apprehension as regards supply in event of interrupted steel production next year.

In some parts a strong tone in black and galvanized sheets is significant, as consumers are cutting stocks.

Blue annealed sheets have become more settled in price at a base of \$4.60. New prices are given herewith:

BLACK SHEETS—

18-20 gauge	5 40
22-24 gauge	5 45
26 gauge	5 50
28 gauge	5 60
A charge of 25c per 100 lbs. is made for less than case lots. An extra 10c. per 100 lbs. is also charged on sheets 2½ in. wide.	
BLUE ANNEALED SHEETS—	
10 gauge, base	4 60
12 gauge	4 65
14 gauge	4 70
16 gauge	4 80
1½-in. and heavier, base.....	3 60 3 75
3-16 in.	3 95 4 25

GALVANIZED SHEETS ADVANCED TO \$6.75 BASE

Toronto.

Premier and Apollo galvanized sheets have undergone an advance in price. The base price now on 28 gauge, is \$6.75, whereas the former prices were ranging on this gauge from \$6.50 to \$6.65 per 100 lbs.

Not nearly so much cutting is going on locally, as was the case a short time ago. The prices published on galvanized sheets are representative of the lowest prices being quoted at present.

A stiffening has been noted at primary sources in all lines of flat steel sheets Queen's Head and Fleur de Lis sheets remain at formerly quoted levels. The new prices on Premier and Apollo sheets are given herewith:

SHEETS, GALVANIZED—

Premier and Apollo Brands—	per 100 lbs.

NEW STOVE BOLT LIST MAY BE ADOPTED

Toronto.

A new stove and sink bolt list of prices has been adopted in the United States. The larger sizes on this list show slight advances in price and the smaller sizes remain the same. The ¼ inch lengths

Why Not Make This a Plumbers' Christmas

WHY SHOULDN'T the plumber get his share of the retail trade? For instance, a big demand for our Tub Shower Bath Faucet and Combination Sink Faucet for Christmas giving will be created through our advertisements now running in MacLean's Magazine featuring these two sensible Christmas gifts, and you can co-operate by running an advertisement in your local paper.

The people are always clamouring in the Christmas gift season for something which will not be put away on shelves and the giver and gift forgotten. They want an article that will be used 365 days in the year, something really useful, something that will reflect the giver's good wishes in after days.

With a prominent display of the Tub Shower Bath Faucet and the Combination Sink Faucet you are sure to benefit from the demand which these two articles have merited by solving the Christmas gift problem.

over 3 inches have been eliminated. The new list is not in effect in Canada as yet, but it is expected that it will become effective in the near future.

SOME TIN PLATE PRICES ADVANCE FIFTY CENTS

Toronto.

An advance of 50c. per box has been put into effect on coke tin plates. A considerable stiffening has been noticed in prices at primary sources on these lines of late and the present advance is no doubt a reflection of the firming of prices in the United States and English markets. Prices now in effect are given herewith:

PLATES, (COKE TIN)—

25x28 100 lbs., basis, box	15 50

SHARP ADVANCE ON INGOT TIN

Toronto.

Local prices have been advanced \$2.75 on tin, making a price of \$52.50 per 100 lbs. Some dealers are looking for further advances in tin, due to the fact that English and United States interests have not as yet covered their requirements.

Lead ore prices are up \$1 per ton, but as yet this has not reacted on pig lead prices, which remain at prices quoted in last issue.

A firmer undertone is existent on copper, primary market prices are up ¼c., but prices remain the same as before in the local market.

Antimony prices have advanced to \$9—\$9.50.

Spelter and aluminum are steady and unchanged in price. Prices in force are given herewith:

INGOT METALS—

Copper, \$18.00 to \$19.00; Tin, \$52.50; Lead, \$8.50; Spelter, \$9.00; Antimony, \$9.00 to \$9.50; Aluminum, \$23.00 to \$25.00.

HIGHER PRICES LOOKED FOR IN SCRAP

Toronto.

The quiet market conditions relating to scrap materials which have been the case for some months past are still existing. No changes in price have been issued during the past two weeks on any

scrap lines, and business is reported to be quiet so far.

Markets in the United States have shown some improvement and prices have moved upward. This condition is expected to be reflected in the local market in the near future and higher prices are looked for.

PIG IRON PRICES RECOVER AFTER DECLINE

Toronto.

Heavy production in Buffalo district caused a decline of \$1.25 per ton in pig iron prices a week ago and low prices of \$27.05 for No. 1 and \$26.55 for No. 2 were being quoted, but during the past week, heavy buying in pig iron has taken place with the result that prices have recovered to the extent of \$1.10 per ton and are now being quoted as No. 1 \$28.15 and No. 2, \$27.65.

PIG IRON—

No. 1, per ton	28 15
No. 2, per ton	27 65

RADIATORS AND BOILERS HAVING GOOD SEASON

Toronto

Heating equipment, such as furnaces, radiators, boilers, and heaters up until the present have been selling well. Dealers report that aside from good quantities of repair work, a good quantity of new installations in heating equipment have been sold.

Prices are steady and unchanged and are given herewith:

RADIATORS AND BOILERS—

Revised radiator list prices are for 1, 2, 3, 4 and 5-column radiators per square foot.
38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60.

Discount on 2, 3, 4 and 5 column standard sizes, 44 per cent. for water and 45 per cent. for steam.

Discount on 1-column standard size, and 2, 3, and 4-column hospital sizes 36 per cent. for water and 37 per cent. for steam.

Discounts on 1 column hospital size water 22 per cent. Steam 23 per cent.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05. Discount 41 per cent.

BOILERS—

Water:

Round 52 per cent. off list. Square 8 per cent. off list.

Steam:

Round, 13 per cent. off list; Square, list plus 7 per cent.

SOME CUTTING NOTED IN SHEET ZINC PRICES

Toronto.

The tendency of primary markets in lead and zinc goods is in an upward direction at present and many importers are looking for higher lead prices in the immediate future.

Contrary to this trend, local prices are slightly easier in sheet zinc in some quarters. It is evident that considerable price cutting is existent, which is confined to sheet zinc.

The prices on lead and solder goods are steady but firm locally, and the price of 11 cents for full casks and 12 cents for less lots is mostly in evidence though quotations exist in sheet zinc as low as 10 cents per lb. for full

casks, and 11 cents per lb. for less than full casks.

The Perfection Towel Bar

A dusty pair of shoes will counteract the efforts of the most efficient tailor.

The same applies to your bathroom—the jarring note produced by one commonplace fixture affects the whole scheme.

Perfection Towel Bars fit in, in fact enhance the most elaborate bathroom layout.

They are made in types and sizes to harmonize with the modest home bathroom or the palatial natatorium.

Each Perfection Bar comes complete—ready for installation.

Your jobber will be pleased to show you the Perfection Line.

Winnipeg.

WINNIPEG, Nov. 29.—Plumbing and heating supply firms report business somewhat less in volume as there is less building activity. Air valves and elbows show a revision in price. Basin connections are quoted at lower levels. Basin supply tips have moved upward. Force cups show a slight decline. Candle wick has advanced to seventy-five cents per pound.

AIR VALVES AND ELBOWS SHOW A REVISION IN PRICE

Winnipeg.

Air valves and elbows show a revision in price. Quotations are list price less 55 per cent.

LOWER QUOTATIONS IN EFFECT ON BASIN CONNECTIONS

Winnipeg.

Lower prices are in effect on basin connections. No. 844 with patent flexible joint is quoted at \$3.60 per doz.; No. 845, bent, at \$4.80 and No. 845½, with adjustable threaded point at \$5.40 per dozen.

BASIN SUPPLY TIPS SHOW AN ADVANCE

Winnipeg.

Basin supply tips show a slight advance and No. 925, size ¾ in. is quoted at 75c. per doz.; No. 925B at 70c. per doz.

NICKEL PLATED COCK HOLE COVERS MOVE UPWARD

Winnipeg.

Nickel plated cock hole covers are quoted at 18c. each. This is an advance over former levels.

FORCE CUPS QUOTED AT LOWER LEVELS

Winnipeg.

Lower quotations prevail on red rubber force cups. Size 4 in. is quoted at \$5.40 per doz. and 4½ in. at \$6.20.

REVISION IN DISCOUNT ON STANDARD BRASS VALVES

Winnipeg.

Standard brass valves show a revision in discount and quotations are list price less 20 per cent.

COTTON CANDLE WICK ADVANCES TO SEVENTY-FIVE CENTS

Winnipeg.

Price of cotton candle wick has advanced and it is now selling at 75c. per pound.

BATH AND LAVATORY SUPPLY PIPES IN FAIR DEMAND

Winnipeg.

There is a fair demand for bath and lavatory supply pipes. No. 849, nickel plated bath supply pipes, are quoted at \$2.75 per pair. Quotations on lavatory supply pipes are as follows:

LAVATORY SUPPLY PIPES—

No. 855, plain 9/16 in. tube, per pair	2 50
No. 855A, plain ¾ in. tube, per pair	2 50
No. 856, plain ¾ in. tube, per pair	4 30

STEADY DEMAND FOR THREADED COLLARS

Winnipeg.

There is a steady demand for threaded collars and the following lines are quoted as follows:—No. 964, cast brass with iron pipe connections and solder joint, are quoted as listed below:

THREADED COLLARS—	Each
Number 964, Size 1¼ x 1¼, each	0 12
Number 964, Size 1½ x 1¼, each	0 19
Number 964, Size 1½ x 1½, each	0 13
Number 965, Size 1¼ x 1¼, each	0 21

COTTON WASTE PRICES REMAIN STEADY

Winnipeg.

A firmer tone is noted in cotton waste, although as yet no change in price has occurred locally. The tendency is expected in an upward direction.

NO CHANGE IN ENAMELED WARE PRICES

Winnipeg.

Prices continue steady on enameled ware. Sales are reported quiet at the present time.

LEAD AND ZINC GOODS PRICES FIRM

Winnipeg.

Prices on lead and zinc goods are ruling firm at the present time and sales are reported to be seasonable.

RANGE BOILERS REMAIN FIRM AT PRESENT LEVELS

Winnipeg.

Prices on range boilers show no change as compared with former prices recorded.

SEASONABLE SALES FOR CORRUGATED SHEETS

Winnipeg.

Corrugated sheets are reported by dealers to be selling seasonable and prices continue steady.

SOIL PIPE PRICES FIRM AT FORMER LEVELS

Winnipeg.

There is little change to report on soil pipe. Prices remain steady under a seasonable demand.

PRINCIPLES OF HEATING AND VENTILATION

(Continued from Page 29)

units, it saves in size of piping required and as long as the exhaust steam can be used, the reduction in pipe sizes is obtained at comparatively small cost. There are several advantages of water over steam for spread out buildings, one being that the water main may follow the contour of the ground and no drips are necessary. Another advantage is that the temperature of the water may be adjusted to suit the outside temperature so that no valves need be touched, while a steam system must give almost constant temperature to the radiators and therefore these must be opened or closed a number of times each day or the buildings become overheated. Where a number of buildings are to be heated from the same main and they are situated at various distances from the power house, a differential pressure valve is used and set so that the pressure between the supply and return to any one building will remain practically constant regardless of changes in the pressure in the mains.

Ventilation

In large open factories where employees are not placed close together and there are plenty of windows, mechanical ventilation is unnecessary unless there are fumes such as in a foundry. In other buildings, however, where

Foreign Trading Curtails Price Cutting

AT THE present time very little price cutting is in evidence on galvanized steel sheets. During the summer months and the early part of this fall, price cutting by distributors of these sheets was prevalent, and it was often advantageous for dealers to shop around previous to purchasing. This has been eliminated to a great extent and the following prices are adhered to almost without exception. This state of affairs is due largely to the effect of tremendous orders for galvanized sheets being placed by the Japanese Government with the mills, and they have purchased all the 28, 30, 31 and 32 gauge black and galvanized sheets that Europe can produce up until early next summer, and are

large numbers of employees are working in a limited space, mechanical ventilation is advisable.

The ventilation may be accomplished independent of the heating system. In this case the heating system is designed to take care of the heat losses through the walls, floors, etc., and the ventilation is accomplished by fans which draw fresh air from outside and pass it over to the heated coils and discharge it into the factory at a temperature of 65 deg. Fahr. or so. The foul air may be drawn out by means of a fan or may be passed out through ventilators due to gravity and the slight pressure put on the room by a fan. For simple systems, exhaust fans only are used and they draw in fresh air from openings around the windows and doors.

In factories making textiles and other special lines it is very necessary to use high grade ventilation systems which are arranged to give good ventilation and also to keep the temperature and humidity of the air at certain points which are known to give the best results. Such conditions are necessary to give uniformity of product. These systems have greatly increased in number during recent years and it is evident that they result in much better quality and quantity of product. They should keep a room at, say, 65 per cent, relative humidity and 60 deg. Fahr. regardless of the conditions outside. This is accomplished by means of a fan, heating and cooling coils and an air washer. The air drawn from outside is heated to, say, 42 deg. Fahr. by being passed through coils which have automatic control. It then passes through a series of fine water sprays which clean it and after these it hits baffle plates which remove the surplus moisture and it is then passed through other heating coils which heat it to a predetermined temperature, after which it enters the fan and is blown through ducts into the room to be cooled. It is evident that as the air passes through the washer it becomes saturated with moisture. If the temperature of the spray chamber

is still placing large orders in America. To date orders for 120,000 tons of sheets have been placed in the U. S., and it is understood that another 80,000 tons are about to be placed, which will keep most of the mills making these lines busy up until February at least. Some Canadian metal interests believe that sheets will advance 25 cents by next spring, while others think that the advance will be made around the first of the year.

Some Canadian importers of galvanized sheets intimate that there is a possibility of a cancellation of the 5 per cent. preferential discount which is allowed to them over prices offered to distributors in U.S., as this generally is the case when a shortage of sheets is noticeable.

is 42 deg. Fahr., for example, the air is saturated at 42 deg. Fahr. if the washer is 100 per cent. efficient, and when it passes out of the washer it goes to the coils where it is heated to say 80 deg. Fahr. and being unable to obtain further moisture, it is probably only 75 per cent. saturated and, therefore, the relative humidity is 75 per cent. It is evident that by raising the temperature of the spray water, the air may be saturated at any temperature we desire and, therefore, the relative humidity on entering the room may be arranged to suit. Where it is desired to reduce the humidity of the air, the spray water is cooled by refrigeration so that when the outside air strikes the cooled spray it is cooled and deposits some of its moisture in the washer.

Cooling devices are used, for example, in the summer in factories making chocolate which is best worked at about 60 deg. Fahr. the year around and 50 to 60 per cent. relative humidity. Automatic devices are now in use for regulating the humidity and temperature. Of course, when the treated air coming into the room mixes with the air already in the room its condition will be taken into consideration when setting the apparatus. Where special systems of this kind are installed, it is usual to recirculate a great part of the air and only bring in such quantities of outside air as are advisable, depending on the outside conditions.

A recent example of this apparatus outside of ordinary ventilation of air washers is in the dry air system for blast furnaces in steel mills. The outside air in this case is cooled down till it deposits the greater part of its moisture and is then blown into the stoves to be heated. The saving, of course, is due to the fact that under ordinary conditions a large amount of heat is used to heat the water vapor and this is all wasted. Mr. Gayley, the inventor, or first user of this system, gives figures showing a large increase in production of iron at a considerable saving in fuel.

Dunham High Pressure Bucket Trap—Type No. 80 Quick acting—Powerful—Accessible!

There's nothing "draggy" about the action of this trap. The shape of the Dunham bucket and a short-coupled leverage obtain unusual power and speed. When the bucket is down and the trap is discharging the inclined bottom stands practically in a horizontal position. As the water is forced out through the discharge tube from the bucket, and the bucket begins to rise from the buoyancy of the water surrounding it, all of the water on the bucket "shelf" is suddenly poured over into the water seal. As a result, the movement of the bucket is greatly accelerated in its closing action.

This is a strong, simply constructed trap for removing condensate from fixtures, steam lines, separators, laundry equipment, heaters, vulcanizers, dry kilns and other industrial apparatus where high pressure steam is used. It is the speediest and most powerful trap of its size and type made. This is due mainly to the shape of the Dunham bucket, as described under illustration.

Another big feature is its accessibility. The cap may be removed without disturbing piping connections. This exposes the double-end valve and reversible valve seat which are made of monel metal. These vital working parts may be quickly reversed or replaced. Compare Type 80 with any other trap for operating efficiency and durability.

Write to us to-day for complete information and price list on Dunham Traps and other heating and industrial specialties.

When to Recommend WATERBURY Chemical Closets

When the cost of installation prohibits the putting in of a regular flush system specify a Waterbury in the correct size.

When there is an inadequate heating system—especially in schools—recommend a Waterbury in the correct size.

Where there is a limited water supply or a poor seepage area—recommend a Waterbury in the correct size.

In all other cases recommend a water disposal system equipped with Dayton Pump and Griffith Air Metal Septic Tank.

Thousands of Waterbury Chemical Toilets are now installed in homes, railroad stations, schools, factories, summer camps, parks and public institutions. Write us today for our attractive catalogue prices and full particulars.

The Measure of Your Message

THE measure of your message is the number of actual readers reached by the publications carrying your advertising.

You may buy "10,000 circulation," but is it delivered, or is it merely a "claim" of the publisher?

The A. B. C. offers a service that will enable the advertiser and advertising agent to measure every message placed in the leading publications of the United States and Canada.

Every day in all parts of the continent A. B. C. auditors are checking the records of publishers, and their findings are tabulated in the form of A. B. C. reports.

These reports, by the authentic, reliable, verified data they contain, enable the advertiser to measure exactly how widely his message has been distributed.

Sanitary Engineer is the only plumbing and heating paper in Canada that has submitted its circulation to an audit by the Audit Bureau of Circulations.

JENKINS Type "K" Bronze Gate VALVES

Here's something different from the ordinary type of Gate Valve.

Cast from virgin metal of the very highest quality and so carefully proportioned that there is no weakness at any point. Spindles are made of Manganese Bronze and all parts are machined to gauge.

These Valves are remarkable for their reliability, their easy operation and the simplicity of their closing mechanism. Valves being of the split-wedge type can be operated in any position without danger of the discs jamming.

Type "K" Valves are suitable for 125 pounds working steam pressure, or 175 pounds working water pressure.

Write for free copy of Catalog No. 9 and read about these Jenkins Models in detail.

Perfect Screw-Thread Joints

HOW TO MAKE THEM: Apply Smooth-On No. 3 to the threads with a brush, like paint, screw the pipe or fitting into place, **and forget it forever.**

Smooth-On No. 3 makes dependably tight joints even when threads are worn or defective. It will stand extremely high pressures and temperatures of water, oil, air, steam, or super-heated steam. It expands and contracts like iron. It is not affected by vibration or violent changes of temperature, because its metallic iron body can never shrink, shrivel, crack, or dry out.

In order that **you** may know this as well as **we** do, and to meet you half way in making a test, we urge that you return the coupon for a liberal free sample.

Use the sample where you have had the worst leaks and **watch the results.**

Smooth-On No. 3 is easy to apply and comes ready to use. At your dealers in 1-lb., 5-lb., and 10-lb. gray-labeled tins, or, if he is out of stock, send us his name and we will see that you are supplied.

Write for a free copy of the SMOOTH-ON Instruction book

This 144-page book of simple directions and diagrams will post you well on the theory of Smooth-On, where to use each grade, how to apply for best results and what to expect from the finished job, based upon pictures and data from over 100 typical applications. Sent free if you mail the coupon.

Are These The Opportunities You're Looking For?

Fan Heating and Ventilating Engineering is the pinnacle of all other forms of heating, and of all branches of steam fitting and sheet metal work. It prepares you for:

1. For Employers it enlarges their business opportunities 100%.
2. Employees it raises to Foremanship of a large shop.
3. Or as Designing Engineer of some large Heating Contractor.
4. As an intelligent Salesman of Heating Appliances.
5. As Chief Engineer with a Heating or Furnace Manufacturing Company.
6. Later a Consulting Engineer to Architects and Building Contractors, etc.

Which of These Are You Working for?

Full information Free.

KERR VALVES

For Steam and Hot Water Heating

Kerr Radiator Valves need no introduction. They have been setting a standard of quality and efficiency in connection with Hot Water and Steam heating for many years, and continue as recognized leaders in this line of valves.

Kerr Valves on your Radiator is a stamp of quality on the job.

Ask your jobber for KERR valves. He likely has them in stock.

Kerr N. P. Union Elbows register with either the Hot Water or the Steam Valve, and are of same standard high quality.

Burnham Boilers

Let The
Lie Lie

This square
shouldered,
broad chested
Twin is about
71 inches wide
and but slightly
over 80 inches
high.

If a thing isn't so, and you find it out, and go right on letting folks believe it's so, is that a lie?

If it is, then we are letting the lie lie, by not changing the ratings on the Burnham Twin Sectional Boiler.

The ratings are now altogether too low, according to the work the boiler did over and over again during last winter's severest of tests.

But we are not going to jack up the ratings. We prefer to have it do more than we claim it will do.

Wishing You The Best of The Season

THE Christmas spirit has got us. As the New Year draws nearer we drop the burdens of Business to wish our friends "A very Merry Christmas and a Happy and Prosperous New Year."

We have worked hard, this last year, to make 1923 a banner year by putting into each article of "Emco" manufacture the best in material and manufacturing skill.

The "Emco" guarantee of satisfaction, and the fact that every "Emco" product is tested under hydraulic pressure before leaving the factory, has placed our name second to none in the Dominion among the heating and sanitary engineering trade.

And, as we look back at our 1923 achievements, we are spurred on to greater efforts to make 1924 a still more prosperous year.

Again wishing you the best compliments of the season, "A very Merry Christmas and a 'still' More Prosperous New Year."

Prosperous 1924

FOR over sixty years we have been providing winter comfort for Canadian Homes.

And year by year the name "Warden King" has been synonymous with every advancement in the science of heating.

This courage to pioneer, to experiment, to seek out newer, better designs and methods has been given us by reason of the loyalty and patronage of the Sanitary and Heating Engineers of Canada. The present day prosperity and success of our business is largely the work of your doing. Heartily and sincerely we thank you.

We wish you, one and all, a Merry Christmas and a Happy, Prosperous 1924.

O ALL of those who have added to the comfort, happiness and health of Canadian citizens throughout the year by promoting the installation of better plumbing—to the owners and builders who have planned and erected—to the architects who have co-operated and specified—to the jobbers who have distributed—and above all to each and every one of the hundreds and thousands of plumbers throughout our great country who have conscientiously carried this great work to a glorious consummation—we extend our most sincere wish for

A Very Merry Christmas

AND to all of those who will continue or undertake to promote the improvement of sanitary conditions in Canada during 1924, we add our equally sincere wish for

A Very Happy New Year

FULL of good luck, good cheer, good health, happiness, contentment and success.

DURING the holiday season, with guests coming and going more than at any other time of year, the sanitary appointments of the home show up with especially good or bad effect.

Where the toilet-room includes a Canadian Solid Vitreous "Quietus-Bellemeade" closet combination, with a Canadian Solid Vitreous Lavatory to match, the hostess proudly knows that no fixtures more sanitary or attractive could have been provided, while her guests equally appreciate the almost silent operation of the closet as well as the luxury of the roomy, white, clean lavatory.

The annoyance and chagrin experienced in many homes this Christmas where less desirable fixtures are installed makes the moment opportune to talk replacement. Why not make up a list of prospects and approach them either personally or by mail. Your efforts we feel sure will be well repaid.

Number of Licensed Plumbers Under Sales Tax Reduced by New Regulations

Special Category of "Contractors" Will Cover Most Small Operators Despite Department's Classification of Plumbers, Steamfitters, and Tinsmiths as Liable to License — Question of When a Retailer is a Manufacturer Again Aggravated

OWING to the apparent difficulty of applying the licensing clause in the new Sales Tax regulations to every plumber, heating engineer and tinsmith doing business over \$10,000 a year, Sanitary Engineer has taken up with the Department of Customs and Excise at Ottawa the question of status of these classes of operators under the new act so that the trade will know definitely where they are at under the new regulations.

In a list of 32 retail trades which are not now subject to the licensing clause of the Sales Tax, but which were expected to be after Jan. 1 next, as produced by the Taxation Department, appear the names of plumbers, steamfitters, and tinsmiths. On this basis and from other rulings which have been secured, certain officials of the department gave it as their opinion that these classes of operators would evidently be classed as manufacturers under the new regulations, be compelled to take out licenses and collect and return sales tax on all material involved in transactions with the public. Rulings were given concerning tax on labor charges, also as to whether fixtures sold in the ordinary retail way would be included in the \$10,000 of business which would establish whether a plumber was to be licensed or not.

Official Advice

In view, however, of the fact that one of the prime advantages of the new act has been that the number of firms from which sales tax is to be collected is greatly decreased, it did not appear logical that every plumber, tinsmith and heating engineer doing over \$10,000 business a year should be licensed and compelled to collect sales tax. The matter was taken up with the head of the department at Ottawa, and Sanitary Engineer was officially advised as follows:—

"No definite instructions have been issued as yet with respect to plumbers. It is the old question of when a merchant is a manufacturer and the solution of this point is tying up a definite ruling. It is being found exceedingly hard to determine when a plumber is and is not a manufacturer and therefore for the time being each individual case is to be dealt with on its own merits. It is unlikely, however, that every plumber, heating engineer or tinsmith doing business over \$10,000 a year will be licensed as a manufacturer. He may be doing business over that amount and still be classed as a retailer, but if the department decides that he is carrying on the business of a manufacturer then he comes under the tax."

It will be recalled that a good deal of difficulty was encountered in trying to establish whether a tinsmith was or was not a manufacturer, but finally it was found that very few tinsmiths were licensed under the existing sales tax. One of the judges who heard a test case on the subject contended that a person could only be termed a manufacturer who produces by labor on a large scale. He stated that, in his opinion, any person who does any work or part thereof with his hands, cannot be considered to be a manufacturer. The retailer was not a manufacturer in the general acceptance of the word. Another judge stated: "One who makes and sells in a very small way, or in one of a few instances, should never be called a manufacturer."

In face of this situation, however, all merchant tailors, whether making suits for special order or for general sale, and doing an ordinary retail business, are to be licensed as manufacturers and compelled to collect sales tax. This decision is causing much protest at the present time.

Discussing the matter fully with the head of the Sales Tax division of the Department of Customs in Toronto, Sanitary Engineer learned that it was unlikely that many plumbers, heating engineers or tinsmiths would be licensed and compelled to collect sales tax. In most cases the work done by these trades is merely individual labor on material, and, as the tax only applies on material, it will facilitate matters for everyone to have the material taxed at the time the plumber or tinsmith buys it. The tax will, therefore, be on a smaller sum than if it applied at time of resale by the plumber, but it is the most likely plan to be followed. A special category known as "contractors" is being made in which these trades and electricians and others will be grouped so that they will not be licensed. This will not eliminate everyone engaged in these trades however, for, as pointed out by the department, there may be conditions which would justify the title of manufacturer being applied to some such operators. For instance, there may be some manufacturing and jobbing concerns which also do a contracting business. There may also be tinsmiths working on a large scale who make up various articles of tinware for sale at retail to consumers or to other tradesmen. This class would be differentiated from the tinsmiths who make up eavestrough, conductor pipe, cornices, etc., and use their own product on a contracting basis. The latter would come

(Continued on page 27).

This Year's Inventory Very Important to the Sanitary and Heating Engineers

Rapidly Fluctuating Prices, Introduction of New Sales Tax, and Need for Curtailing Costs on Stock Carried in Shop and Show-room Give Inventory Great Importance—How to Handle Stock-taking This Year

Prepared by Sanitary Engineer, making use of the best practice of numerous operators

EDITOR'S NOTE:—Several factors combine to make this year's inventory a most important undertaking and one surrounded with more difficulties and dangers than is usually the case. The past year has quite held its own among the years of rapidly fluctuating prices since 1915, and now, as the end of the year draws near, merchants are faced with an increase in the Sales Tax which practically amounts to an increase in the cost of most goods, effective from Jan. 1. This, combined with the fact that the Income Tax Department is very insistent upon certain details in statements revealing business profits, makes it necessary for the retail merchant to exercise precautions in doing this work this year. The following article outlines the way in which to best meet the conditions affecting this year's stock-taking operation, being based on the best practice of a group of progressive sanitary and heating engineers and also based on information secured in interviews with Income Tax Department officials:—

A GREAT many price changes have taken place during the past year, and, with the new sales tax regulations coming into effect at the first of the year, many further alterations in prices are to be soon expected. These changes, and the fact that the inventory forms an important part of the records for use of the Income Tax Department, make it essential that the record be accurate and taken on the right basis. Stocktaking entails much hard work, but is simplified if a definite plan is established and strictly adhered to. Once commenced, the job should be pushed right ahead, keeping in mind the fact that delays invite mistakes.

The period which is set aside for inventory taking, whether it be in December or at any other time, is the most important period in the year from the point of view of the proprietor. Results of inventory taking have a great bearing on the policies to be adopted for the following year, and in many cases these results have the effect of changing business practices which were in use

during the previous year. Conditions peculiar to the individual business will, in many cases, determine as to what time of the year is most suitable for taking the inventory. In the majority of cases sanitary and heating engineers favor the end of the calendar year. It is generally found that the period between Christmas and the new year is a very quiet one, making an excellent time to concentrate on counting and weighing up the stock. As far as the Dominion Income Tax is concerned, it does not matter what time of the year the stock is taken, as the clause in these regulations governing this point reads to this effect: "All fiscal periods ending within the calendar year are taxable in the year in which they terminate."

Preparation

About a month prior to the date set for the inventory, the entire stock should be thoroughly gone over, and in all cases where goods are mixed up or not in their proper shelves or bins, care should be taken to sort up and allocate each article to its place. Goods should be piled neatly

together, and stock in drawers and bins assorted and straightened up.

It will be found that at this time an excellent opportunity affords itself to clean out any dirt or dust that has accumulated on the shelves or in the bins during the past year, which operation can be done quickly when bins, etc., are empty as goods are removed to be weighed or counted up.

All tools should be carefully examined and defects repaired and broken parts replaced so that a proper estimate can be placed on them when they are listed. This end of business is one of the most important features of the inventory, as will be realized when each tool and part of the shop equipment is valued and added up and a total value of shop equipment is obtained.

Elaborate inventory equipment can be used, but this is not necessary, and often adds to confusion. Some of the most successful operators have tried almost every conceivable short cut and have come back to simple equipment, which includes a supply of well-selected inven-

The above is a sample of a practical form of inventory sheet. Note the separate columns for units, depreciation and special marks or memos. The use of this form is fully outlined in the article appearing herewith.

tory sheets, fitting a binder, with at least a column provided for each of the following headings: quantity, article, description, size, number, cost price, cost extension, and a memo or extra column for special marks or particulars. A supply of slips for tabulating each shelf or bin is also necessary. It is suggested that a different colored slip or card be used for each year, in case an old slip belonging to a former inventory should turn up, thus avoiding a mistake.

Divide Into Departments

Many of the most successful operators divide their inventory into departments or sections and use separate sets of pages for each class or department of goods irrespective of their order or location in respect to other departments. These divisions of the inventory should be made under the following twelve headings: Brass Goods; Closets; Enamelware; Iron Pipe; Cast Fittings; Malleable Fittings; Nipples; Lead Goods; Sundries; Show Room; Tools and Equipment. The scrap materials collected during the year that are on hand at the end of the year should be classed as items under the heading of sundries, as well as any other odd items or lines that cannot be classed under the other headings.

All short lengths of pipe should be collected and sorted into racks with approximate lengths together, so that they are accessible at a moment's notice. This will save time by eliminating hunting the required lengths from piles in which all lengths are mixed. This will do away with the necessity of cutting short lengths from long stock, and will be found to be an economical measure.

The forms illustrated are recommended and have been successfully used by operators in the inventory binder, and on which the goods are entered when called from the slips or cards placed in each bin.

Number the Departments

A plan followed out by many dealers each year, consists of numbering off each section of drawers or shelving. Beginning with No. 1 at the front or back of the store or stockroom on one side, they go right to the other end with these large

sized number labels, then they do the other side in the same manner, each show case, corner and rack containing stock also being labelled with a number. These stock location numbers should be used in connection with each entry on the stock sheet, as it often happens that it is necessary to check back on quantities or prices. This plan enables one to locate the item at once. It might be mentioned here that it is necessary to head each sheet with the floor number, such as basement, ground or first floor, etc., where the stock is kept on more than one floor, depending on the size of the shop.

The question of care and accuracy cannot be stressed too much. Tradesmen should be impressed with the necessity for plain writing and complete descriptions, thus avoiding having to go back over stock for a missing number, which more than doubles the work.

Sales During Inventory

Stock items should be entered on the colored slips or cards immediately they are counted, using a line for each item. Sufficient space should be left at one side for an extra column for special marks, and which may be used when the quantities are changed. This will occur in the event of a sale being made prior to the day set for closing the inventory when the calling in, and writing in, should start. It might be mentioned that the term "sale" applies to goods sold at

once or used on jobs or contracts which are in reality sales and are termed so in the inventory proceedings. The stock is not actually "taken" in the true sense of the word until it is entered on the official inventory sheet. When sales are made after the date set for the inventory it should be thoroughly understood that each item must be listed on the charge sheet or cash slip, according to whether it has been recorded in the inventory or not. Perhaps the simplest way to mark these items is to mark "taken" items T and items which have not yet been included N T. Some responsible party should go over every charge or sales sheet at the end of each day's sales and check up on employees who have omitted to mark each item either T or N T.

If the writing in of the inventory should start before the date set for the closing of the year, which often is the case, the marking of the sales slips must start also. Up to inventory day, a record is kept each day of the total costs of all goods sold out of items marked T, or taken, and this amount is deducted from the inventory total. After inventory day, a record is kept each day of total costs of goods of items marked NT, or not taken, and this amount is added to the inventory total. The reason for marking each item T or NT when only part of them are used in the records, as described in the foregoing, is simple. The rule is to have each item marked so it will not be overlooked in any way. If only the inventoried goods were marked before the inventory day, some one might be guilty of an oversight and it would be assumed that the item had not been inventoried. The same thing is true of "Not Taken" goods after inventory day.

Calling In the Stock

After closing time is, without a doubt, the best time to call in the stock. The staff should be divided into pairs, one man calling off the goods on the slips and at the same time checking the original count by the actual stock. The other man writes the description clearly on the inventory sheet, calling back the quantities, weights, sizes and numbers as a double check against errors.

An important feature of this part of

Joint Efforts Producing Better Grade of Pipe Fittings

Combined Efforts of Mechanical Engineers and Manufacturers of Fittings Bringing About Standard Weights and Specifications to Protect the Plumber—Processes of Manufacture, Inspection, and Distribution Outlined

Address by CLIFFORD G. SHERMAN, Sales Manager, The Grinnell Co. of Canada, Ltd., Toronto, before Hamilton Sanitary Engineers' Social Club

A VERY interesting talk on the production of pipe fittings was given at the last regular meeting of the Hamilton Sanitary Engineers' Social Club by Clifford G. Sherman, sales manager, The Grinnell Co. of Canada, Ltd. After the usual dinner, which was interspersed with group songs, special solos and other entertaining features, the speaker of the evening was introduced by Charles Marks of Hamilton.

In introducing his talk Mr. Sherman made it clear that the manufacturers of fittings were doing all in their power to improve the quality of their product. Improvements were constantly being made, though this advancement cast no discredit upon the quality and standards which have been upheld in the past.

He pointed out that the American Society of Mechanical Engineers along with the manufacturers of fittings had got together in the United States to decide upon standard weights and specifications for fittings. At the time these specifications were agreed upon, his company was making the old type of fitting. Changes were subsequently made but after one and one-half years marketing it was found that more complaints were being received than Grinnell Company believed should be made against a strictly high-grade fitting. It was decided that the fitting was a little too light for Canadian and U. S. trade and \$250,000 was spent making over the patterns. Samples were shown of the heavier fittings which resulted.

"I am not apologizing for the old one," said Mr. Sherman, "but it did not prove to be our conception of what a commercially perfect fitting should be." Mr. Sherman continued as follows:

There has been some doubt in my mind as to whether the manufacture of fittings discussed as an abstract subject, would prove interesting, unless you have an opportunity of seeing the actual operations at the same time.

Let's begin with the Iron:

Metal Composition

The physical composition of Grinnell grey iron castings is approximately as follows:

- 55 per cent. pig iron.
- 25 per cent. sprue—or in other words, our own foundry scrap.
- 15 per cent. purchased iron scrap.
- 5 per cent. steel scrap.

Pig Iron

The pig iron is the best grade obtainable, particular attention being given to correct chemical composition.

The steel scrap is put in to add strength to the final metal fabric; too

much steel scrap makes a fitting hard and brittle, but a little steel in the mixture adds strength as well as improving the fine texture of the metal.

Melting Temperatures

In melting the mixture, experiment and experience have taught us the tem-

The next meeting of the Hamilton Sanitary Engineers' Social Club will be in the form of a joint social gathering with the craft from Galt and the members of the Live Wire Club from Toronto. The latter members will provide the speaker and entertainment and the gathering will be held in Hamilton.

perature which gives the best and most uniform results, and very careful attention is paid to this important item.

During the pouring process, three test bars are made each day, one taken from the first part of the heat, one during the middle of the heat, and the third at the end of the heat. These test bars are carefully tested to A. F. A. standards and should they fail to test to

standard the melt or that part of the melt is scrapped.

Borings for Analysis

Further than this, borings are taken from each test bar and two separate chemical analyses are made from each melt, this being done to insure uniform quality.

Our pattern equipment, molding machinery and methods have been worked out having in view the absolute minimum of defections and vibration troubles. Our patterns are plate type, cast iron and machined true. The core boxes are also cast iron and machined. The machining of these patterns and core boxes is a mighty difficult and expensive job, but it helps insure a smooth inside and outside surface on the finished casting.

The molding machinery is all mechanically operated. The sand is introduced into the molds by automatic chutes and packed by jolt squeezer machines. These machines are a particularly essential part of the work because they permit an even distribution of sand pressure throughout the entire mold. This in turn largely eliminates surface irregularities and to a less extent sand holes.

As far as possible cores are machine made largely because a machine core is the least likely to be irregular or pitted.

Molding Sand

We pay considerable attention to molding sand. Foundry practice which allows the re-use to any great extent of dead sand usually produces castings with too great a percentage of sand holes. We re-mix used sand only to the point where such mixture produces a close grain casting with a uniform surface.

Pouring and Cranes

The pouring process is largely mechanical: small hand operated cranes are provided for the molders with the pouring ladles suspended and the molten iron is brought to them by larger cranes and ladles.

Rattling and Inspection

The finished castings are rattled when cool or cold. They then go to the sorting and inspection benches where every fitting is individually inspected for casting defects, before going to the machine shop. Take an average day's run of many thousand castings and just believe me when I say that this is no small task.

Before leaving this discussion on strictly foundry work I want to point out that for every ton of good castings it is necessary to melt and pour at least

CLIFFORD SHERMAN,
Sales manager, the Grinnell Co., Ltd.,
Toronto, who addressed the Hamilton
Sanitary Engineers' Social Club.

a ton and a half of metal. The percentage of scrap is largely sprue and to a lesser extent bad castings.

Machine Shop

The machine shop operation is one of the most interesting parts of our work, and it is also the place where the fitting in the making receives very careful attention.

The tapping machines are all automatic and thread one, two or three threads at the same time and in the same operation. The spindles are set on a circular dial plate at required angles usually either 90 degrees or 45 degrees. There is no possibility whatever of one thread in a fitting not being at the correct angle to the other threads of the fitting when all the threads are made at one time. And right here I want to explain what constitutes a crooked thread in a fitting.

Crooked Threads

Each fitting has its own chuck or set of jaws. This is made in two pieces and machined on the outside to fit the machine holder and on the inside to fit the exact outside surface of the fitting. When these chucks are set in the tapping machine the spindles are exactly lined up in relation to the chuck itself. The fitting is then placed in one half of the chuck and the other half brought up tight by compressed air and locked rigid by a lever arm. The spindle lever is then thrown and the taps enter and thread and then all release at the right depth and the same moment.

Fitting in Chuck

Now if all these operations are perfect the result is a perfect fitting. But suppose a fitting has a slight surface irregularity or a tiny wart that has not been noticed and ground off or that a little piece of metal has found its way onto the inner surface of the chuck; then when the fitting is clamped tight in the chuck it may not be in exact alignment with the spindles; or the taps themselves at the point of entry may ever so slightly force the fitting into a different position. The result is the threads are correctly formed in relation to themselves, but in relation to the fitting as a whole, one or more of the threads may be slightly out of line.

What is done to overcome this? The most rigid inspections are constantly maintained at the machines themselves. One fitting in about every twenty-four is actually gauged and tested as to alignment. If an inspector finds the least thing wrong he orders the spindle stopped and calls the machine setter. But sometimes a few get through and it is nearly impossible to detect the defect especially if the thread is only out one or two degrees.

I have brought out the cause of crooked threading to show how extremely difficult it is to always overcome it; and perhaps the next time one of you run against one and cuss you will remember that we are cussing every hour of every working day in the attempt to avoid them.

Hand Threading Often Out

Please don't get the impression that it is always the fitting that is out either; it is a lot easier to cut a thread on a piece of pipe by hand than that is a few degrees out of line than it is to tap a fitting a few degrees out by machinery.

FRANK LANG

Secretary of the Hamilton Sanitary Engineers' Social Club, who does much to enliven the series of meetings held by that organization.

The thread gauge and depth is another matter that receives very close attention. When a spindle is set up for a fitting the first twelve fittings of the run are each gauged separately on each outlet. If the adjustment is not perfect at the first fitting twelve fittings are gauged after it is made perfect.

Gauging and Gauge Limits

We are allowed a thread either way of perfect gauging under standard practice; but we have elected to scrap all fittings that are more than a quarter turn on the tight side and more than three-quarters of a turn on the loose side of perfect gauging. Out of the million fittings in our bins you would find it mighty hard to find a thread that does not gauge within these limits.

Fittings Wash or Bath

The last operation of importance is the fittings wash or bath. We tap all

fittings in oil because we believe this to be the best practice but necessarily much attention must be paid to cleaning.

From the machine shop floor the fittings are dumped through a chute to a moving carrier which discharges into the mouth of a rotating cylinder, immersed at its low end in a cleaning liquid which is kept at the boiling point. The inside of the cylinder is fitted with a continuous spiral baffle which gradually takes the fittings through its length and discharges them at its upper end on an endless belt. When the fittings come out they are clean and wet but their absorbed heat almost instantly dries them.

Final Inspection

The moving belt discharges its load into the final inspection bins. In the final inspection every fitting and every thread in every fitting is examined. In this inspection sand holes and casting defects are again looked for as well as rough or broken or chattering threads. The larger fittings are all rapped with a hammer for cracks or broken castings. The fittings are distributed in steel casks and the inspector can usually detect a cracked fitting when he drops it into the cask.

Storage or Stock Keeping

I think it might interest you to know how we keep up stock. We have kept an accurate daily record of every fitting leaving the plant for the last seven or eight years. These disbursements have been averaged over a series of the big months during this time, and our minimum stock is based on two and three big months' supply on fast running sizes and nine months' to a year's supply on slow moving sizes. It is the stockman's duty to order on the foundry before the stock on any size gets to its minimum count.

President C. F. Rogers thanked Mr. Sherman on behalf of the club for his splendid address and the invitation which had been extended for a visit to be paid to the Grinnell Co. plant in Toronto. Mr. Rogers thought such an inspection might be arranged next May or June.

Gordon Stewart presented a splendid prize to the member who composed the most interesting meal from special menus which were distributed.

NEW HEATING PLANT IN HOSPITAL

Chatham, N. B.—A new heating plant has been installed this fall by the Sisters of the Hotel Dieu. By means of this plant, three buildings—the convent proper, St. Michael's Academy, and the Hotel Dieu—are heated. Steam is also secured for the operation of the laundry.

CONVENTION STILL IN DOUBT

Hamilton, Ont.—The question of whether the International Association of Plumbers and Steamfitters will hold a convention next year will be decided by a referendum of the membership. The last convention was held in 1921, for which 50,000 journeymen paid an assessment of \$5 each. Most of the local journeymen, it is stated, are opposed to a convention next year, owing to the unsettled industrial conditions.

HAMILTON S. E. S. DINNER SCHEDULE

The Sanitary Engineers' Social Club of Hamilton, the account of whose meeting will be found in this issue, have arranged an interesting program of dinner meetings for the coming months, to which they are extending a cordial invitation to anyone connected with the plumbing industry. The dates of the dinners, which are held in the Arcade Dining Hall from 6.15 to 8 p.m., are as follows:—

December 19,
January 16,
February 13,
March 12,
March 26,
April 9,
April 23.

Sales Promotion Plans for Small Plumbing Operators in Large Centres

Value of Select Lists of Prospects and Sending of Letters, Where Operators are Unable to Make Economical Use of Other Forms of Advertising, is Outlined by Speaker at Meeting of Toronto Craft

AT THE regular monthly dinner of the Live Wire Club, a recently organized group of plumbing and heating engineers in Toronto, the chief address was delivered by Russell T. Kelley, advertising counsel, of Hamilton. On the occasions when such splendid addresses are delivered it is unfortunate there is not a bigger turnout of the trade, there being only approximately forty sanitary and heating engineers in attendance at this gathering.

"We are all Canadians," said Mr. Kelley, "and are all interested in our country. Only a short while ago I had been giving a short talk on a somewhat similar subject when a question was put to me—a question that is occupying a good bit of attention these days. It was 'How are we to keep our young men in Canada?' From a Canadian standpoint we have lots to be proud and optimistic about but here is a serious problem that we should give serious thought.

"The question set me thinking and I can only offer one suggestion. That is by the buying of goods that are made in Canada. Only a few days ago I read a page advertisement in a Toronto paper, in which an American truck company listed, not the Canadian users of their trucks, but the Canadian firms and corporations owning and operating fleets of their trucks. There is no reason why those trucks should not have been made in Canada. We have several truck companies here in Canada that could have made these trucks and it would have been of assistance in the stabilization of the country.

Advocated Buying Canadian Goods

"If we men here were to take and form a circle and start to pull, each one of us forming a link and each realizing our own individual responsibility, we could do much. Recently, I was speaking on this same point, to a group or advertising men,—the one class of men whom you would expect, even above others, to patronize home industry—and I asked the men to look at the bands in their hats. The surprising result was that only five per cent. of the hats were made in Canada, although we have a number of manufacturers of first-class hats right here in Ontario. The same thing applies all through. Get behind the idea of buying goods made in Canada. This is my only plan for keeping

"I believe that no manufacturer can get along without using his trade paper for placing his goods before his prospective customers," said Russell T. Kelley, Hamilton advertising specialist, who added: "I also believe that no retailer can get along without reading his trade paper every month to keep in touch with the latest developments in his trade."

our young men here. Give them employment and you will not lose them."

Turning from this phase of Canada's position, Mr. Kelley made reference to the question asked by Roger Babson, during the latter's visit to Toronto. Babson was asked what was in store for Canada during the next twelve months, so far as prosperity was concerned. To this he replied by asking what percentage of Canada's population were engaged in farming.

"Of course, his reason for this question is self-evident," said Mr. Kelley,

RUSSELL T. KELLEY

Hamilton advertising specialist who was the chief speaker at the last meeting of the Live Wire Club in Toronto.

"for just as our farmers are successful, so will the rest of the country be successful, in this country where 50 per cent. of our population are engaged in agricultural pursuits. And we people of the cities and towns do not pay enough attention to this factor of our national prosperity.

"For example, there are two things in which you men can use your influence in the interests of general prosperity through the prosperity of the farmer. They are the encouragement of better farming and co-operative marketing."

Mr. Kelley then related a number of incidents where tests had been made, showing that the non-productive animals and fowl kept in large numbers in the herds and flocks of the country were a loss to the farmer. He also pointed out the loss through the lack of co-operation in marketing, closing this part of his talk with the statement that Canada stands to-day on the threshold of a wonderful development, and urging every man to do his share in helping bring it to pass.

Four Types of Advertising

Coming to advertising, Mr. Kelley explained briefly the divisions in the various forms of advertising, saying that billboard and street car advertising were known as publicity advertising and were useful for breaking down sales resistance, though not creating any desire to buy. Direct-by-mail advertising and advertising in publications, on the other hand, were creative advertising forms because they not only helped to break down sales resistance but helped create desire.

"When an advertiser advertises in his trade paper, he creates a real demand for his goods on the part of the reader," asserted Mr. Kelley. "I believe that no manufacturer can get along without using his trade paper for placing his goods directly before his prospective customers. I also believe that no retailer can get along without reading his trade paper to keep in touch with the latest developments in the trade. In the course of the advertising business, many trade papers dealing with various trades come into my office and I read them all with interest.

"So, to the manufacturer I repeat that he advertise in his trade papers. To the jobber, I would like to say that each month the manufacturers are send-

(Continued on page 21)

Two Easily Arranged Displays Which Will Sell Equipment This Christmas

WINDOW display No. 127 impressively puts before the eyes of the public that good circulation means economy of fuel for the heating plant; that it will pay to investigate the subject of good appliances to promote good circulation.

The back and sides of the window are draped with dark cloth hanging from a wire. This should be high enough to cut off all view of the store. Drapery at the top of this, for a finish, will improve the appearance.

The ornamental background behind the radiator is two pieces of wall board, shaped alike and painted a light color. The two pieces are nailed on a wooden strip up the centre. Place this in the rear centre of the window.

In front of the background place a pedestal about 18 inches high, for the radiator; and, in front of that again, a pedestal about five inches high, for the gas plate and tea-kettle.

Place pedestals with sloping tops about 18 inches high, one at each side at front of window; tops covered with black cloth. Tack gray cloth around the front and side edges of the black tops, and drape to the floor as in picture. Cover the floor and other pedestals with the same kind of cloth, allowed to fall into natural folds.

Show the radiator equipped, as if in actual use, with supply valve and trap. Gas plate under teakettle should also appear the same. From spout of kettle to a nipple in supply valve, run a length of rubber hose. On sloping tops of pedestals at sides of window, wire samples of the air valves and traps which you sell.

The cards read: "Good Air Valves Save Their Cost In A Hurry. Please ask us How and Why"—"Efficient Traps Will End Many Heating Troubles. Let us explain their Economy."

Window Display No. 128 uses a complete, modern bathroom, to drive home the fact that modern fixtures or a new bath room would be appreciated as Christmas gifts.

The rear and side walls are beaver board, with tile effect up to the usual height, and plain above, painted appropriately. The white and black tile floor is made of 6 in. x 6 in. pieces of beaver board.

Arrange an up-to-date bath room, including built-in tub, built-in shower, pedestal lavatory with combination faucet, built-in medicine cabinet above lavatory, high grade closet with vitreous tank, and a full line of small fixtures to complete the outfit.

Hang a bath robe, towels, and other

articles in their place to add life to the display.

The circulation signs calling attention to details are pasted on the inside of the window glass in a semi-circle, as shown. Before pasting to glass, paste pointed ribbons on the face of the circular signs and drape each ribbon to the article the sign represents.

The circular signs read as follows:

"Tub Built-in—No dirt beneath or back of it."; "Towel Bars—No Torn Rusty Towels."; "Shower Bath—Finish in Clean Water."; "Small Fixtures—Complete Comfort and Convenience."; "Medicine Cabinet—Convenient and Safe."; "Faucet Combination—Wash in Running Water."; "Pedestal Lavatory—Attractive, Easy to Clean."; "Modern Bowl—Sanitary, Quiet."; "China Tank—No Leaks—Less Trouble." The Large sign reads: "A Christmas Gift of Lifetime Usefulness—A Complete Modern Bath Room. This Entire Outfit, only &..... This display shows many inexpensive things that any housewife would appreciate for Christmas."

Asbestos exports for the year ending October 31 amounted to \$8,432,725, more than \$2,000,000 more than in the previous twelve-month period, when the total reached was \$6,204,514.

Heating and Ventilating Department

Working Out a Problem in Application of Group Heating to Buildings

Have Not Come Very Far in Perfecting Heating Facilities—Study of Plant Designed to Heat Two Residential Blocks

By H. C. KIMBROUGH, Secretary American District Steam Co.

THERE is nothing so essential to "Life, Liberty and the Pursuit of Happiness" as a tranquil mind and creature comforts. Now the very beginning and foundation of our physical well-being is and always has been in the temperate zone, heat, and the degree of ease with which this prime necessity is supplied to mankind becomes the measure of his comfort and tranquility.

But we have not come very far in developing the manner, means or methods of securing this essential, have we, when we recall the vivid picture of the Indian, sitting around a fire built in the centre of his primitive tepee, the flap of which is opened to permit the smoke to go upward, the while he plans moving on to his next temporary residence, or promotes excuses for more war paint. And do you know, it is barely possible that smoke in the eyes has had much to do with engendering hatred, and bloody battles thereafter, all of which we charged to savagery or general blood thirstiness, while as a matter of fact it may have been violent reaction to uncomfortable heating methods, then as now.

Later on, we had our thrill over the picture of the soldier, warming his back and his face at a fire on the ground. And planning more battles;—again suggesting idea that war will not cease so long as we continue our antiquated methods of heating. A heat complex, then, as our collegiate person puts it. You have had a few domestic engagements yourself with wife, man or maid servant about the heating of the premises, because of the dust, dirt and attendant annoyance, unless perchance you have had the good fortune to have heat at your disposal via the valve in the basement, from a central steam plant.

The point of the statement, that we have not come very far in our manner and method of heating, is that the greater percentage of the world population is still "backing up to the fire," or giving loud cheers over the fact that a large base burner has been perfected, one which will require coal, with resultant ashes all over the house. The cheering grows louder when the base burner is ousted and into the cellar is

placed the last word in a boiler,—the point of difference being that when the coal is poured into the stove, in the front room of the house, you can see the ashes go about the room, finding such place of lodgment as to cause the greatest amount of work for the woman of the house, howbeit, the man left a fine fire in the stove, likewise a fine mess all over the premises. While in the case of the furnace or boiler in the basement, the designing engineers—let us call them designing and not crafty!—have accomplished one highly astute thing, i. e., the dirt sifts up through the floor, casements, etc., but you do not see it, so everything is all right—until the announcement is made that "we will just have to clean house," which includes washing curtains, re-decorating everything, restoring pictures to first color and recovering that which was lost or covered up, due to the continuing primitive methods of heating.

Again I repeat, we have not come very far in our methods of heating, and it may be interesting to work out a single problem of the application of "Group Heating of Buildings," which is the subject suggested.

Block Heating Defined

The subject of group or block heating, and the application of the principles of community or group heating in cities large and small, have led to a desire to ascertain the smallest divisible unit of

operation which can be successful commercially. For this purpose a detailed investigation of the engineering and commercial factors was promulgated, and I am indebted to Walter J. Kline, of the American District Steam Company, for his engineering study of this very interesting problem of group, or community heating.

Study of Plant Designed to Serve Two Residential Blocks

The chosen field for observation included two well-built residential blocks in a city. In this report were discussed all of the items involved in the inception, organization, design, construction and operation of a district heating proposition, confined within the limits of a community or block plan.

The most important of these items were:

- Proper selection of block or district.
- Volume of space to be heated.
- Amount of heat required based upon recorded data for similar latitude.
- Design and cost of power boiler plant.
- Discussion of return system and cost.
- Method of operation, meters, etc.
- Cost of operation.
- Fixed, depreciation, and maintenance charges.
- Revenue to be paid by members of the community.
- Surplus to be paid to participating shareholders.

Conclusions Based on Original Study

The original study included a number of items which have been checked and revised as a result of conference and discussions, as well as a review and checking by other engineers and individuals who were interested.

- (1) By running a single steam main with long services, instead of a

INVESTMENT AND OPERATION

Cost of 300 H.P. boiler plant and stack	\$36,000.00
Cost of steam distribution system (including trenching)	38,000.00
Cost of meters and valves	3,750.00
Total cost of construction	\$77,750.00
Cost of coal—\$6.00 per ton	\$19,800.00
Cost of teaming coal and ashes	3,300.00
Depreciation, maintenance, insurance and taxes,—(8%)	6,210.00
Maintenance, boilers, etc., \$2.00 per H.P.	600.00
Cost of water	500.00
2 firemen—8 months	\$2,240.00
1 chief—12 months	1,800.00
1 meter man and clerk	800.00
Miscellaneous expenses	250.00
Total operating, fixed and labor charges	\$35,510.00
Income from 38,090,500 lbs. of steam if sold at sliding scale of rates, approximately \$1.31 per thousand pounds (coal \$6.50 teamed to power plant) total sales	\$49,898.00
Operating charges, forward	35,510.00
Surplus over operating	\$14,388.00
Percentage on investment, (\$77,750.00) 18.5%.	

Getting Your Share of the Holiday Business Needs Careful Planning

Sanitary and Heating Engineer Has Plenty of Goods Suitable for Gift Purposes if He Will Take Trouble to Make Public Realize the Fact—Health and Durability Provide Two Good Sales Points

THERE is no denying the fact that the holiday gift season is the most promising one in the whole year for everything in the way of retail merchandising. Everyone knows that each day thousands of people are deliberating every day as to what they shall buy. However, it remains to the individual dealer and firm to see that there is more than a promise of business—is up to each one to assure the diversion of a portion of this business into channels of his own liking.

In no case is this more true than in the instance of the sanitary and heating engineer. People have not been in the habit of buying such goods as form the stock in trade of these artisans for Christmas giving, and it remains for the engineer that is going to reap his share of the gift season harvest to sow along educational lines so far as the public is concerned.

The industry produces scores of moderate priced and attractive products which are entirely suitable for Christmas gifts and the plumber should need no argument nor persuasion to convince himself of the value of showrooms and display windows during the season. His own personal experience will tell him of just what occurs in both the minds and the pocketbooks of practically every man and woman in the holiday period.

The assortment of plumbing and heating offerings can include separate items such as the modern combination sink faucet, with or without the various improvements, such as soap dishes and sprays. In the bathroom accessories line, such goods as towel bars, showers, mirrors, heaters, medicine cabinets, tumbler holders, scales, soap dishes and tooth brush holders might be mentioned as particularly good ones, with a fair range of prices, all well within the purse

of the person not wishing to spend any overly large sum.

Then there are the larger gifts, among which might be included heating improvements, washing machines, water heaters, laundry tubs and the like. Such gifts will not only give a great amount of pleasure to the recipients, but are useful gifts of long life, beneficial in most cases to the health of the entire family.

In arranging the Christmas season displays, the general custom of the Christmas season should be followed, this including certain colorings like green and red and something of the effect of frost or snow. A neat window can be made up without difficulty using such a decorative scheme, and a point that should not be forgotten is that a seasonable message, in the form of a neat-

(Continued on Page 28)

The introduction of the Christmas atmosphere into the window trims at this season of the year is one of the best means of attracting attention to the fact that the sanitary and heating engineer has goods that will make useful and lasting gifts, adding much to the comfort and health of every member of the family.

Tinsmithing and Sheet Metal Work

Numerous "Puzzles" Upon Which Sheet Metal Workers Can Practise at Their Leisure

Brings Out Reason why Round Vessels Hold More Than Square Containers of Similar Dimensions

By O. W. KOTHE, Principal, St. Louis Technical Institute

MANY sheet metal workmen are interested in something that is of little value, especially that has some hook or crook to it that everybody else does not understand. So, in traveling through the country every now and then, the mechanic is quite forward in bringing forth some peculiar problem that has more of a puzzling aspect than any practical or theoretical value. In this case we have two such problems, which may help to set a few other workmen right as to their real merits.

The first problem is shown as "A," where a piece of metal 8 x 8 inches square is cut up in such a way that it is supposed to make 65 square inches. That is, its original size was to contain 64 square inches or 8 x 8 inches in size, and when it is reassembled it is to be 5 x 13 inches, thus giving 65 square inches. Now, to be able to stretch the metal that much, so to speak, is a puzzle to most workmen. But unfortunately the law does not hold good in geometry as it does in loaning out money for interest or something like that. Our drawing "A" shows the measurements for cutting up this piece of metal originally 8 x 8 inches square, while the drawing "B" shows the pieces reassembled so as to make a rectangle relatively 5 x 13 inches in size. Now, in using cardboard there is always a little stretching of the paper and the rough edges that would throw a person off sufficiently to make it appear that measurements were exactly right. By cutting each line on the bright tin accurately with a sharp, square shear, so that there is no pulling or drawing to the metal, and then reassembling it, a diagram will be obtained similar to "B." The slant lines take up a small fraction of an inch somewhat less than an $\frac{1}{8}$ or a $\frac{1}{16}$, which is often hardly noticed by the experimenter. But if accurate tab is kept, losses in size will be accounted for somewhat as we show in this drawing, which makes eight-eighths of an inch, and that is a square inch, which is accounted for. Because of this difference the tradesman is asked not to jump to conclusions at the first trial, but if accurate work is done, the shortage in "B" will be self-evident.

Another sort of conundrum is shown in drawings "C" and "D," where most workmen fail to see that a round vessel will hold more than a square vessel of similar dimensions. That drawing "C" is two inches square and contains four cubic inches, while drawing "D" is two inches in diameter and one inch high and contains 3.14 cubic inches. Then the difference in this tank or vessel will be in the corners, where the square vessel will take on more area because of the corners shown by the dotted position of "D" than the round cylinder. But here again in taking their girths or circumference we see that "C" requires eight inches of girth shown by "F," while "G" is the girth for "D" and only requires 6.28 inch, so there is some difference in circumference that cannot be compensated for in volume.

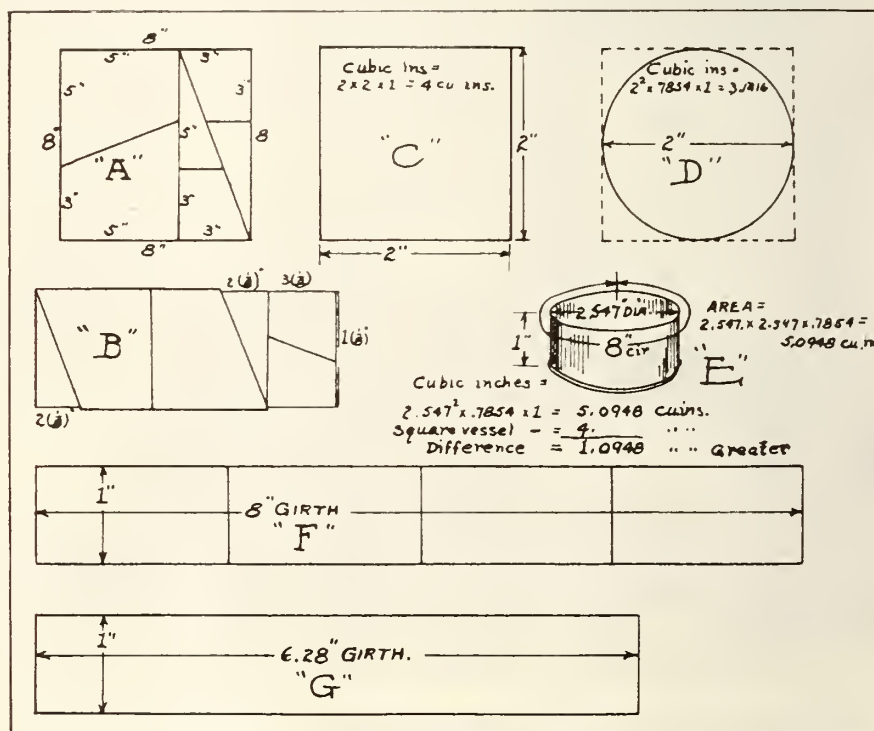

Now to consider a round vessel as "E," that has the same girth as "C," or eight inches; then the round vessel

would have 2.547 inches in diameter. Figuring the volume for this diameter, we would have 5.0948 cubic inches. Here it is rather odd that the round vessel "E" has over five cubic inches of volume, while the square vessel has only four cubic inches, there being a difference of 1.0948 cubic inches where the round vessel is greater than the square vessel. The loss results in the corners; where these corners are sharp in "C" the metal crosses over itself, so to speak, while in a cylinder as at "E" the metal is continuous and does not interfere with an adjacent side.

Any workman can try out these things to his own satisfaction by making small models, and then making his calculation accordingly and the reason will become self-evident. So in reality there is no puzzling about the problems.

CANADIANS INTERESTED IN NEW STEEL COMPANY

Erie, Pa. — Announcement has been made by W. C. Johnson, of Pittsburg, that, acting for a group of Pittsburg and Canadian steel men, he has obtained options on two thousand acres of land at Shade Lake, Pa., which may be purchased as the site for a large steel mill. The company is said to represent \$250,000,000 in capital.

Patterns of Some of the Unusual Problems Which Often Confront Sheet Metal Men

Intersecting Round Pipe in Flat Surfaces on a Diagonal Angle is Problem Often Met With

Pattern Shows Solution to Problem of Double Angled Tee Intersection, as Worked Out on 45-Degree Angle

Written for Sanitary Engineer by O. W. KOTHE, Principal, St. Louis Technical Institute

NOW and then it occurs that a round pipe must be intersected in a flat surface on a sort of diagonal angle, meaning to have a bevel in plan as an elevation. Whether these intersections would be on another pipe, as in heating and ventilating, or a forced draft system, or on other surfaces such as tanks, hoppers, hoods, etc., the treatment would be the same. The idea is to have a plan angle, which in this case is 45 degrees, where the line 7-7 in. is the horizontal axis line of tee in plan and the line A-B is placed on a 45-degree angle to it, while the elevation axis line 4-4 in. is placed on a 45-degree angle with a vertical line. With these positions properly located the problem becomes similar in development as all other tees. So, describe the sections "M" and "N" of elevation and plan and divide them in the same number of equal parts, projecting lines from "N" horizontally to intersect A-B and from "M" draw them parallel to 4-4 in. indefinitely. Now, from each point in plan or line A-B we erect lines to intersect those of elevation of similar number, as in points

1 in., 2 in., 3 in., 4 in., etc. This gives the points of penetration between these two fittings and enables drawing the miter lines as shown.

To set off the pattern for tee we extend the line 1-7 of elevation as 1-1 and on it step off the circumference for the tee. This can be done by calculating the true girth and measuring off and afterwards checking up from spaces from "M" so as to equalize any discrepancies. Next project lines from each of these points parallel to 4-4 in. of elevation and then from each point in the miter line of elevation square out lines to intersect those in stretchout of similar number. This gives us points 1 ft., 2 ft., 3 ft., 4 ft., etc., and enables tracing the irregular curve and gives the pattern for the tee. If the pattern for the opening is desired, observe where the tee "N" of plan intersects the line A-B, which gives us the length or girth which the tee covers in this position, so we pick these spaces as 4 in., 5 in., 6 in., 7 in. of plan and set them on a horizontal line over from elevation. From each of these points we erect lines and

then from each point in the miter line of elevation we bring over lines to intersect those in stretch out of similar number and this enables tracing the outline for the opening. Where the edges are to be seamed together an extra allowance must be made on the inside for seaming purposes.

SALES PROMOTION PLANS

(Continued from page 16)

ing out large quantities of what are known as 'dealer helps.' Thousands of dollars are wasted each year because the jobbers do not co-operate with the manufacturers in passing these 'dealer helps' along to the retailers. Get behind and help the manufacturer.

"Many retailers in a city as large as Toronto cannot afford to advertise in the large daily newspapers. Rates are based upon circulation and the returns would not be in keeping with the outlay necessary, to say nothing of the fact that the paper's distribution would bring up the difficult problem of transportation expense. For example, a small order might be received from some point on the other side of the city, time and expense of delivery completely eating up the profit of the transaction and leaving the cost of the advertising as a loss.

Best Form for District Business

"It may seem strange, coming from an advertising man whose principal interest lies in the preparation of advertising for publication in newspaper and magazines, but I believe that the retail plumber or heating man in Toronto will find best results from advertising matter specially directed toward his particular prospects.

"Take the district immediately around your shop, get the names of every householder within a certain area and send out occasional letters to them, touching on your service or on what you have to sell. The manufacturers with whom you deal will be only too pleased to furnish you with literature for enclosing with your letters. After you have gone over this territory thoroughly, broaden out a bit, taking in more territory in the district until soon you will find that you have a representative list covering a good area.

"Take care in such letters always to get the personal touch into them. Address the letters to the prospects personally, with initials and addresses correct and sign your letters personally. Make your prospects feel you are interested in them and in the securing of their patronage. Check over your list frequently and keep the addresses up-to-date, for the list is one of the most important items. Spell all names as the people spell them themselves, even though this may be slightly different from the manner in which they are usually spelt, and you will get your prospects quicker than if you are careless.

Working Drawing Shows Pattern for Angle Iron Used By Sheet Metal Men for Reinforcing Pipe.

Questions and Answers Regarding Plumbing and Heating Practice

How to Plan Piping for Septic Tank

Plumber Who Has Done Little Rural Work
Enquires About Details of Getting Proper Relative
Height of House Drain

Editor Sanitary Engineer:—Not having as yet installed any rural plumbing, and purposing doing so in the near future, I would like to receive a few pointers as to how to go about the job of installing a septic tank.

I have a number of back copies of Sanitary Engineer in which there appears a number of articles describing sewage disposing systems. I purpose following the information contained therein, but there are just one or two details about which I am not quite sure.

For instance, suppose I am going to put in a septic tank, how do I go about the job of getting the proper relative length of the house drain as it leaves the house and the four-inch clay drain tile which goes to make up the disposal bed?

Western Ontario Plumber.

Answer.—First let us congratulate our engineer for having decided to go after some rural business. The country is simply teeming with profitable business for those who go after it in the proper manner.

Now regarding the question: The way

to go about it is, first to dig a trench or a hole 23 inches deep in the ground area where the field tile pipe is to be laid. Next take levels backwards towards the house and use the measurements shown in the accompanying illustration of a septic tank. This illustration shows clearly the proportional sizes and measurements of a septic tank suitable for a house occupied by a family of four.

Now, having found the level at which the field tile pipe is to be laid, it can be established where the hole for the tank is to be built. Take a stick and mark it off so as to determine at what position the house drain is to pass through the wall of the house. The hole will be three feet below the level of the ground, and the bottom of the horizontal piece of fitting No. 1 will be three feet four inches higher, that is, provided that the bottom of the tank is made of concrete 6 inches thick.

It will be noted that the top of the septic tank will only be one foot six inches higher than the normal level of the ground and with one foot of earth as a covering, the total height of ground

over tank is about two feet six inches above the natural level of the ground where the sewage disposal field tile is laid.

TECHNICAL EDITOR.

Too Much Waste in Current for Water Heater.

Editor Sanitary Engineer:

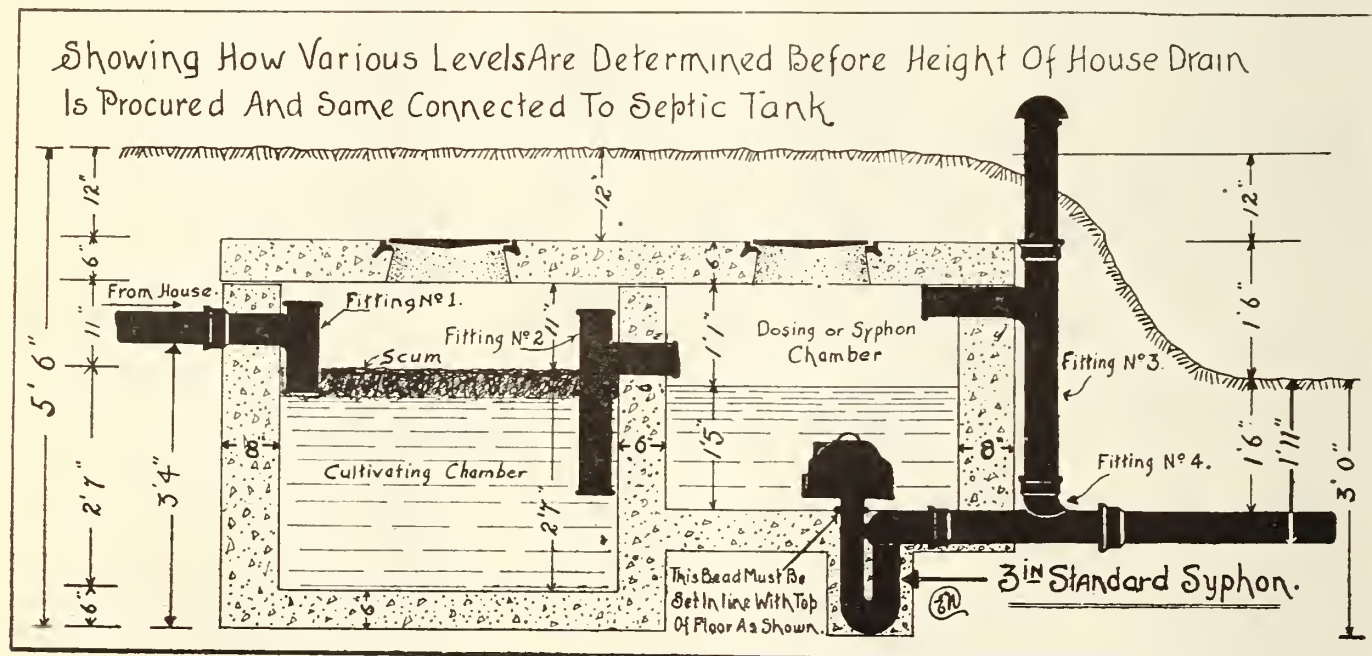

One of my customers has had an electrician instal an electric heater to heat the water in a range boiler. When the house was built I installed the plumbing and I put a circulation pipe on the hot water supply so as to enable him to get hot water quickly and without wasting a lot of water.

It now transpires that the way the electric heater is fitted, it is using too much current because all the water is continually in motion, and too much heat is lost by radiation from the hot water. What can be done to cut down the loss of current?

Electric Water Heater

Answer.—There are only two ways to overcome this waste of electric current. One is to have all the circulation pipes and range boiler well covered with some reliable pipe covering.

The other way would be to disconnect the circulating pipe at the boiler, take out some of the pipe and plug or cap

the ends. Another way, too, would be to have your customer procure what is known as a flat rate electric heater.

then the question of loss of electric current would not be a factor.—Technical Editor.

Wooden Gas Pipes Were Once Used in City of London, Ontario

Wooden Pipes Used With Much Success for Distribution of Gas—Laid About Year 1875

Wooden Gas Mains as used in the City of London, Ontario.

WOODEN pipes were used for the purpose of distributing gas in the city of London, Ontario, with a great degree of success for many years. In the year 1875 or thereabouts, some twelve to fifteen miles of wooden pipes were laid. The sizes were from 4 inches to 8 inches in diameter, and were made from tamarack logs, bored out by a specially designed lathe. They were turned up and bored in 8-foot lengths and fitted together with tapered male and female joints, similar to the method adopted when fitting wooden pump cylinders together. All the fittings, such as tees, crosses and bends were turned up, too, in specially designed lathes. The pipes and fittings were tarred, then rolled in kiln-dried sawdust, tarred again and the pipes were again rolled in sawdust. This treatment assisted resistance to moisture.

From what can be learned from the London City Gas Company, the pipes gave splendid satisfaction for upward of twenty years, and even to this date when excavating work is being carried on, these pipes are unearthed, some of them are found in a splendid state of preservation, though some of course are found to be completely rotted away.

A snapshot of some of these pipes shows the good condition some of them are in. Sanitary Engineer found the wood in a sound condition, and the tarred and sawdust coating gave evidence of good service. The two pieces shown herewith are 8 inches inside diameter, the walls being approximately two inches thick.

A PROBLEM IN GROUP HEATING (Continued from Page 18)

- "loop" with short services, it was found that the cost is reduced somewhat and these figures are used in the estimate herewith.
- (2) The value of the water plus the value of the heat in the condensate is insufficient to justify the required investment in return mains.
 - (3) An ornamental stack can be constructed which will be sufficiently attractive to be proof against reasonable objections. It will add to the cost at least \$1,000 which has been included in the revised figures.
 - (4) In a study of a community or district heating plant, in St. Louis, the idea was proposed of building a community garage with capacity for 15 cars, in which would be located the boilers, likewise room for storage of coal. On the second floor it was proposed to equip an apartment for the man who would be in charge of the garage and the firing of these boilers. Such a building would cost roughly \$25,000 to \$30,000 and the rent of garage space would more than provide interest and return on the combined community boiler plant and garage.
 - (5) From the figures we have eliminated all items of "customer's house piping."
 - (6) We have eliminated "interest" from the cost of operation.
 - (7) The item of "coal cost" has been reviewed from the standing of assumed evaporation "steam delivered" to customer on efficiency of

operation. Oil burning is out of the question at this time, because of the cost of oil.

- (8) It is quite evident that clerical labor, superintendent, fitter, etc., if charged to a single block, will result in a disproportionate overhead. The same organization can look after many blocks, and therein lies the desirability of including all the desirable block in a district rather than a restricted community. The matter of depreciation and maintenance has been reviewed and is established for the purpose of this analysis as follows:

Maintenance—general . . . 2% of the total
Maintenance—boilers 2.00 per h.p. per year.

Depreciation 4% of the total
Insurance and taxes . . . 2% of the total

Cost of Construction and Operation

The following, then, is the statement of cost of construction and operation of a single unit, or block plant. It consists of 42 residences, 4 apartment buildings, one club and nine garages, aggregating 3,630,000 cu. ft. of space, which will require an annual average of 38,090,500 lbs. of steam condensed in radiators and house piping. Based upon an evaporation of 6¾ lbs. of water per pound of coal and an "efficiency of delivery" of 85 per cent., there will be metered 5¾ lbs. of steam per pound of bituminous coal burned, or approximately 3,300 tons.

Hundreds of community heating plants may be installed throughout the country on the co-operative participating plan, and made self-sustaining, with a fair return on the cost, and providing for upkeep and renewals.

Advantages of Plan

Financially the desirability of pooling the cost of installation and operation of many individual boiler plants, and constructing and operating one central plant, is evident. Why not do away with the annoyances of getting coal, handling ashes, and depending upon irresponsible attendants? Why not have one smoke stack instead of a multitude? Why not enjoy a clean community free from the smoke nuisance and its damage to property and furnishings?

A very worthwhile item to consider in the presentation of community or district heating is the avoidance of coal shortage, in advance of the heating season. The unloading of coal in the basement of the individual house represents a very considerable tying up of money which earns nothing during the winter season.

The foregoing results are based upon 100 per cent. of the existing buildings participating in the community, or block plan of heating, and it becomes at once apparent that the greatest possible "load" should be secured to insure the maximum return on the investment.

From the standpoint of the consulting engineer, the cost of a plant or

A Startling Scientific Finding

IN THESE days when human ingenuity is being taxed to devise effective methods for increasing production, it is again emphasized that simple and commonplace factors which, in some instances, may be the real key to a problem, frequently are long overlooked or practically ignored on the assumption that the only possible solution must be found by some roundabout and difficult method.

Many employers who have felt that the only remaining hope for increasing the efficiency of their working forces, has been in the employment of efficiency specialists armed with intricate plans for extracting productive "pep" from the individual workers, will be startled by the report of the New York Commission on Ventilation, on the effect of high temperatures on health, vigor and working efficiency, which recently was reviewed at length by Dr. W. A. Evans, the well-known health authority. Of special significance to readers is this paragraph of the report:

"An increase from 68 to 75 degrees F. caused a decrease of 15 per cent. in the work done by workmen who were stimulated by a cash bonus. An increase in temperature from 68 to 86 degrees when the relative humidity was 80 caused a reduction of 28 per cent. in the work done, in spite of the bonus offer."

The report summarizes the findings on the effect of living in overheated rooms, as follows:

"For these reasons we believe that the dangers of room overheating are far more serious in their effect on human health and efficiency than has been generally realized, and that every effort should be made to keep the temperature of the schoolroom, the workroom and the living room at 68 degrees or below."

Dr. Evans stresses another and vital factor in heating, by stating that there has been found to be a definite relation between the temperature of factory rooms and accidents.

"When the temperature is kept at 67 degrees F. there are fewer accidents," says Dr. Evans. "The accident rate in factories kept at 52 degrees F. was 35 per cent. higher than in those at 67. At 77 degrees F. the accident rate was 39 per cent. higher than at 67."

Dr. Evans directs attention to this paragraph:

"The most important result of our experiments, perhaps, has been the demonstration that even so-called moderate temperatures, between 75 and 86 degrees, are accompanied by demonstrable harmful results. Extreme high atmospheric temperatures are highly prejudicial to human health and comfort, and it is to such temperatures rather than to chemical pollution that most serious effects of bad air are due."

The commission sets a relative humidity of 52 per cent.

as being best. It is admitted that the relative humidity of the air is a factor in comfort, but the commission believes that variations in humidity within reasonable limits are not as harmful as generally believed.

When it is considered that the simple attention of a janitor of ordinary intelligence is all that is necessary to hold the temperature down to the point of highest working efficiency in the winter months, and that the health and comfort and the productive ability of employees may be reduced as much as 28 per cent. through the rise of a few degrees in temperature, while the likelihood of accidents increases as much as 39 per cent., it will be seen that the finding of the New York Commission is worthy of much more than mere academic consideration of employers and departmental heads.

The law of gravitation became evident to everybody—after Newton discovered it. The recent discoveries in ventilation, which their exponents do not pretend will cover all the factors of human efficiency, do seem so important that one is led back to the truism that true efficiency is in daily reach of all of us and usually it is the simplest way of doing a thing.

Care in Stocktaking

INVENTORY time is just around the corner, and many plumbers are looking forward with great interest to a survey of the figures which will show them the result of their year's operations. In many shops, accounting systems are in use which give a fairly accurate idea of the progress of the business from month to month, but even in such cases, the annual taking of stock is an operation which holds much of interest.

It would appear that there is little reason for any misgivings concerning the year's business, many plumbers reporting as large or a larger volume of business this year than last year. There is somewhat of an element of uncertainty in some quarters, probably due more to the feeling that things have been going too good to last after the years of depression, than to anything more tangible. The odd thing is that a number of plumbers who have absorbed some of this all-too-current sentiment have, upon making a thorough investigation of their businesses, found that they are making much more money than they thought they were. We have in mind one plumber who frequently pulled a long face over keen competition and was convinced that he was not making money, who was very much surprised when auditors went over his books for a six-month period of this year and found he had made a net profit of \$1,750 after allowing himself a salary as part of the firm's expenses, as he should rightfully do.

The inventory this year should be taken with great care, because of the fact that prices are undergoing rapid fluctuation and a proper basis of cost should be established as a sound working basis. The disposition to be made of the higher sales tax must also be considered, as it practically amounts to an advance in price on most lines of supplies from Jan. 1 next. The fact that some lines of supplies are being advanced anywhere up to 7 and 8 per cent., and the sales tax being held responsible, shows the necessity for care.

Officials of the Income Tax Department, while admitting that plumbers cannot be checked to the last cent on such statements, point out that in various ways plumbers fool nobody any more than themselves by doctoring up inventory statements and other records to suit themselves. Some plumbers have said they are planning on adding a straight 1½ per cent. to the cost of their goods in taking inventory after Jan. 1. On the face of it it would appear that this would provide a more favorable return for taxation, but exactly the reverse is the case, as will be noted upon thorough examination.

Christmas Greetings

"CHRISTMAS comes but once a year, but when it comes it brings good cheer."

The foregoing, dealing with the most universal holiday observed throughout the world, expresses in simple manner the spirit which characterizes the observance. Christmas is the day of glad goodwill wherever the angel song of "good tidings of great joy which are for all people," has been heard, and where the Child whose birth they hailed has been welcomed to hearts and homes.

The Christmas spirit is the spirit of "peace and goodwill." It is a little over five years since the world was thrilled with the joy of peace after the years of war, and those five years have been substantial progress in the rehabilitation of the races which suffered and in the providing of means by which the peace of the world may in future be preserved.

The whole progress of the world is based upon "peace and goodwill," and it is largely through the high appreciation of this spirit that progress has been made rapid on this continent. Friendly countries border our vast Dominion, there are no hostile demonstrations, fortifications or other implements of warfare. One hundred years of peace between these countries has recently been completed and made the cause of much jubilation.

This is the spirit in which things are accomplished. There is no time for suspicion and ill faith, and all through the course of business extension the spirit of "goodwill" is the one that must dominate.

In Canada this Christmas finds us in favorable circumstances to enjoy a merry time. This country has not had the tremendous boom felt in the country to the south, but there are dangers in too rapid expansion and the steady progress made in Canada is perhaps the surest guarantee of its continuance. The outlook appears bright with plenty of chance for everyone to make a comfortable living providing intelligent restraint is practised, and it is only by such practice that the true spirit of Christmas can be diffused.

Sanitary Engineer takes this opportunity of extending to all readers the hope for a Merry Christmas and a Happy and Prosperous New Year in 1924.

Opportunities Do Not Count Without Co-operation

Minute Message No. 41

Written for Sanitary Engineer by FRANK STOCKDALE

Buying Series

MANY towns seem to have everything needed for growth and prosperity. They have a good trade territory, the people have money to spend, and the stores are filled with goods, yet somehow they do not go forward, people do not buy liberally, and the stores do not prosper as they should. The reason is easy to find.

There is too much suspicion, too much jealousy, too much fault finding.

The result is that some "hold empty pitchers," some "drink from the town pump," some "eat sugar" and some "take their lemons natural" when they could all have delicious "lemonade" merely by a little co-operation.

The big shops reach out and get business because they are organized to do so. They have the "pump," the "pitcher," the "sugar" and the "lemons" all under organized control.

Can the smaller operator meet this competition?

The answer lies mainly in his ability to sacrifice little things in order to win big things—his ability to co-operate with his fellow tradesman.

THINK IT OVER—APPLY IT TO YOUR BUSINESS

All Rights Reserved by Sanitary Engineer for Exclusive Publication in the Plumbing Trade in Canada.

News Notes From Coast to Coast

Doings in the Plumbing and Heating Industry

BUSINESS CHANGE

The Pas, Man.—A. T. Engebretson, who has conducted a plumbing business here, has been succeeded by C. S. Dickens.

DISCONTINUES BUSINESS

Estevan, Sask.—The Union Plumbing & Heating Co., of this town, has announced the discontinuing of business.

CONTEMPLATE NEW BUILDING

Toronto.—Page-Hersey Tubes contemplate the erection of a new finishing building of brick and steel construction.

WILL INSTAL COMFORT STATION

Regina, Sask.—The public comfort station, to be installed in the basement of the city hall, has advanced a step further with the calling of tenders by the city commissioners. The plans for the installation fix the estimated cost at \$8,500.

PLUMBERS SELL TOYS

Ottawa.—McKinley & Northwood, Ltd., in the development of their Christmas business, have launched farther afield than is the case with most plumbing, heating and sheet metal workers, their advertising in the local newspapers containing the announcement that they are handling Christmas tree holders and construction toy sets.

PREPARING TO BID

St. John, N.B.—Plumbing and heating contractors of St. John, N.B., and vicinity are preparing to bid on the heating and plumbing systems of a new church in East St. John, a suburb of St. John. The new edifice will be built near the recently opened dry dock, and near the proposed new docks of the Canadian National Railways. The foundation for the church is now under way.

PLUMBERS RETURN FROM NEW ENGLAND

St. John, N.B.—Judging from the numbers of journeymen plumbers who have returned to the eastern provinces from New England, the slump in New England has taken definite hold of plumbing and heating contracting there. A number of journeymen went to New England in the summer and fall, drawn there by the prevailing high wages during the building boom in Massachusetts and other states of New England. Most of the building ceased the middle of November. The returning journeymen expect to return in the spring if the high wages continue, but there is ample doubt that the same wages will prevail, owing to the undoubted building slump.

AWARDED HEATING CONTRACT

Stratford, Ont.—The Duggan Plumbing & Heating Co. have been awarded the contract for the heating system in the plant of the Brooks Steam Motors, Ltd.

PLUMBERS WIN AT BOWLING

Goderich, Ont.—The Plumbers defeated the Bankers in the opening game in the bowling tournament on the local alleys. Fred Hunt captained the winners, who included Jack Woods, M. N. MacDonald, D. McMillan and Pat Murphy.

INSPECT AMERICAN PLANTS

Vancouver.—Central heating plants in Portland, Tacoma and Seattle were inspected by local lumbermen who are interested in the project to establish a similar plant in Vancouver, should the ratepayers grant them a franchise at the coming municipal elections.

PLUMBERS URGE MORE CONVENIENCE STATIONS

St. John, N.B.—The question of convenience stations has again come to the fore in the city council of St. John, N.B. This question has been discussed by the members of the St. John city council for the past fifteen years but no progress has been made, the tendency having been as usual with the members of the council on all subjects to waste valuable time in discussion. St. John is one of the few cities in America minus at least one comfort station. Master plumbers have repeatedly urged the necessity of opening one of the stations. There are many available locations but through the apathy of the city council members, the matter has always been shelved.

SANITARY ENGINEER LETTER BOX BRINGS BUSINESS

Sanitary Engineer has received the following letter from the Missouri Water & Steam Supply Co., St. Joseph, Mo.: "A postal to us referring to page 21 of your November 15 issue was recently received. From the information you furnished the . . . Co. they sent an order to us for a repair which has been sent to them. Thanking you for your interest in this matter,

*"Missouri Water & Steam Supply Co.
"per F. J. Flynn."*

INVESTIGATE CENTRAL HEATING PLAN

Ottawa.—A central heating plant to heat the city hall, police station and other civic buildings adjacent to the city hall is being considered by the board of control. Data are being secured from other cities where this system is in force.

APPROVE CENTRAL HEATING BY-LAW

Winnipeg.—Ratepayers of this city gave a safe majority to the money by-law for the erection of a central steam heating plant. Work will be started as soon as possible, although the larger activities will not be undertaken before spring.

LANDLORDS MUST PAY WATER RATES

Woodstock, Ont.—The problem as to what to do in the case of unpaid water bills was solved by the Water and Light Commission here when it was decided that the landlord would be responsible in a rented house. The cutting off of the water for unpaid bills was strenuously opposed by Dr. Ruttan, M. O. H.

INSTALLING METERS IN LONDON

London, Ont.—The metering of London's water supply to eliminate waste is nearing an end, the meters being installed at the rate of 600 a month. Over 3,000 meters have been installed since the work was begun, expert plumbing inspectors making a thorough examination of every water service for leaks before a meter was installed.

RECEIVED TWO EXHIBITION AWARDS

London, Ont.—The Empire Brass Co. received two awards this fall from exhibitions where they exhibited their Empire-Duro water systems. The exhibit of water systems and plumbing goods shown at the Western Fair here was awarded a gold medal, while the exhibit of Empire-Duro pumps shown at the Yarmouth County Fair, Yarmouth, N. S., was awarded a diploma of merit.

INSTALS BIG PLUMBING AND HEATING JOB

St. John, N.B.—The heating system as well as the plumbing in the new skating rink in Dartmouth, N.S., has been installed by S. H. Crimp of Dartmouth, plumbing and heating contractor. Mr. Crimp succeeded J. Ritchie & Company. The rink which has been named the Marks-Cross Arena was recently opened with formal ceremony. In addition to his plumbing and heating business, Mr. Crimp is also a sheet metal contractor and maintains a hardware store in Dartmouth.

Instal Plumbing; Charge on Taxes

A recommendation that the Fort William Board of Health obtain from the next city council an appropriation large enough to ensure plumbing installation in premises where the owners are unable to pay for the work, was included in the annual report of the sanitary inspector submitted recently. The inspector also urges the formation of a definite program in respect to the enforcement of the Public Health Act on streets already provided with sewers. "The elimination of the old fashioned privy and provision of proper sanitary arrangements tends to greatly reduce infant mortality," he said.

As showing a condition which exists in the foreign section of the city, the inspector stated that he had served during the year 518 notices to repair privies and had posted warnings in five languages and an advertisement in a Finnish newspaper, all of which brought good results.

During the year fifty-five old premises were connected to sewers and plumbing installed in accordance with the city by-law.

Prize Contest by Empire Brass Mfg. Co.

For the last few years one week in each year has been set aside by the Duro Pump & Manufacturing Co. of Dayton, Ohio, to be known as "Duro Week." The primary idea is to help the plumber increase his sales of Duro pumps. The factory has prepared a window display to be placed in the plumber's show-window according to his own idea of arrangement.

Prizes, amounting to \$100 in gold are being offered to the Duro salesmen sending in the greatest number of photographs of Duro Week Window Displays, same to be submitted before December 20th. Prizes are to be divided as follows:

1st prize, \$50 in gold; 2nd prize, \$25 in gold; 3rd prize, \$10 in gold; 4th prize, \$5 in gold; 5th prize, \$5 in gold; 6th prize, \$5 in gold.

Empire Brass Mfg. Co., Ltd., London, Ont., are distributors in Eastern Canada for this line of pumping equipment which is marketed here under the name of Empire-Duro and to do their share in boosting along the Duro Week idea they are offering \$30 in prizes to the plumbers in their territory who prepare the best Duro window displays.

The week commencing December 3 was selected as Duro Week but plumbers who have not had an opportunity to get in their displays by that time can get them in during the week of December 10th or the week of December 17th, providing photographs are in by December 20.

Death of J. H. Owston

Toronto.—The death of John H. Owston, sales manager of the James H. Robertson Co., occurred at the General Hospital here, following an illness of six weeks' duration. The deceased, who was 55 years of age, started in with the James H. Robertson Co. in a minor capacity over 35 years ago, advancing to the position of purchasing agent and sales manager, making a wide circle of friends in the trade throughout the province.

The late Mr. Owston was active in Masonic circles, being a past master of St. John's Lodge, A.F. & A.M., and a Shriner. He was also a member of Albert Lodge, I.O.O.F. He is survived by his widow, Mary Langdon Owston; his father, John Owston; five brothers and one sister.

A great many of the prominent manufacturers of plumbing and heating equipment and officials of supply houses were among the many mourners attending the funeral, which took place on Tuesday, Dec. 11.

JOHN H. OWSTON,

Sales manager, James H. Robertson Co., who passed away this week. He had been employed with the firm for over thirty-five years.

FEWER PLUMBERS AFFECTED BY NEW SALES TAX

(Continued from page 11)

within the category of contractors and not subject to license, but those making articles for retail sale to consumers or to other tradesmen might correctly be classed as manufacturers and subject to license if they do over \$10,000 of such business a year.

This is apparently as clear a review of the existing situation as can be made at present.

A ruling which Sanitary Engineer has secured from the department concerning the application of sales tax on business

transactions entered into about the end of the year and carrying over into next year is as follows:—

"As respects the tax applicable on transactions which were consummated prior to Jan. 1, all goods sold and shipped on or before Dec. 31 are subject to the present provisions of the law. The present tax also applies on goods sold on or before Dec. 31, invoices for which have gone forward and for which payment has been made on or before that date even though such goods are, at the request of the purchaser, stored for later delivery by the seller. 'Payment has been made,' in the previous sentence, means actual cash or cheque payment or the acceptance on or before Dec. 31 of a draft payable at a later date."

The foregoing means that on all goods sold and shipped before the end of this year the present sales tax of 4½ per cent. will apply irrespective of when the goods are paid for. But if a plumber orders material in December and asks the manufacturer to hold the material for delivery any time in 1924, and fails to pay for the material by Dec. 31 in cash, by cheque or accepting draft payable at a later date, the higher sales tax of 6 per cent. will apply on the account when it is settled.

The new tax will be one of 6 per cent. levied at the source of manufacture or import. It will be collected in practically every case by the manufacturer on the sale price of his goods, whether he is selling to jobbers or to master plumbers or tinsmiths. There will be no tax on the jobbers' transactions with master plumbers, but the tax which the jobber paid when he bought the goods will be passed along to the retail distributor when he buys through jobbers.

An Advantage

Under these conditions there is an advantage in buying goods before the end of this year, a bigger advantage for the jobber than for the master plumber, but an advantage for both. The jobber only pays 2¼ per cent. tax on purchases from manufacturers to-day and the master plumber pays 4½ per cent. tax. After Jan. 1, either purchase from manufacturers will be on the basis of 6 per cent. Hence, most jobbers and some master plumbers are feverishly placing orders to take advantage of the situation. It must be remembered that delivery can be made next year providing payment is made by December 31, but a ruling is to the effect that any goods produced by manufacturers must be specially appropriated to orders placed before Dec. 31. This is to prevent manufacture on a large scale now by producers who might take orders after the turn of the year and date them back so as to give buyers the advantage of the smaller sales tax.

Canada's total exports during the year ending October amounted to \$994,436,069, imports over the same period totalling \$912,459,278.

A Line on Doings of the Old Country Trade

AT a recent meeting of the Association of Plumbing Teachers, held at the Polytechnic, Regent St., London, A. C. Martin, of the Northern Polytechnic, entertained them to a lantern lecture on acetylene welding.

* * *

THE Master Plumbers' Association has agreed to join the newly-formed National Association of Water Users. The Master Plumbers have a live organization, being represented on practically all organizations connected with or touching upon the work of their craft, and are paying particular attention to the education of the young plumber.

* * *

FOLLOWING upon action taken at the meeting of the General Council for the National Registration of Plumbers, held at Bournemouth during the summer, a committee has been at work revising and re-organizing the register, and taking up other matters relative to re-organization. It is presumed that on the successful conclusion of this work, the promotion of another Plumbers' Registration Bill will be undertaken.

* * *

THE Institute of Plumbers held its half-yearly meeting on November 22, at Colwyn Bay. A new feature, introduced at the meeting by the Executive Committee, was found in the informal gathering preceding the regular session, at which various matters governing the interests of the plumbing trade were discussed by the representatives of area federations and local associations.

* * *

AN interesting discussion which arose at the half-yearly meeting of the Institute of Plumbers was brought up by Ian Dyson, of Leeds, who said that it had been stated that colored students had passed the plumbing examinations with flying colors, while English candidates had not done so well. This, he maintained, was not the case, the practical test given the colored students having really been no test at all, while the English boys had done far better work.

* * *

SOME idea of the growing scope of the plumbing trade and the adaptability necessary to engage successfully in it may be gathered from syllabus of subjects for the examinations in plumbers' work issued by the City and Guilds of London Institute, which indicate that a young man presenting himself for those examinations must possess a considerable knowledge of such subjects as the properties and uses of gases for the fusion of metals, the heating of water,

illumination; sheet and plate metals, including the setting-out patterns; thermit welding or fusion welding of hard metals, such as steel, iron, copper, brass, etc.; gas fitting; hot water supply, heating by hot water and steam, even by central heating stations; ventilation; the construction of chemical plants; ship plumbing, including heating and ventilating, steam pipes and bending, welding and rivetting of large pipes, in addition to a knowledge of the usual scientific subjects, such as inside and outside lead work, sanitation and drainage.

PROBLEMS IN GROUP HEATING

(Continued from page 23)

production should not weigh against the desirability of community heating service. The countless community centres in which there are six, ten, a dozen or twenty property owners,—whose chief concern is the comfort of dependable heating service and who are able and willing to pay a reasonable charge for the privilege,—would be the consulting engineers' field for development of community heating plants. Every building having at present a heating boiler has a potential beginning of an argument for a community or block plant, because the longer the owner operates this separate unit, with its separate upkeep, labor and annoyance, the more certain is the possibility of interesting him in "buying his heat" from a central community plant, through properly installed underground heating mains; just as has come to be the custom of having water through pipe, gas through pipe, and electricity by transmission into the house, apartment or business building.

We have "backed away" from this very interesting study and development long enough, it would seem, and it is clearly a wide and almost unexplored field of substantial return to the consulting engineer, and his collaborator, the architect.

GETTING SHARE OF SEASON'S TRADE

(Continued from page 19)

ly-printed showcard, will add much to the sales effectiveness of the display.

In catering to the Christmas trade, as in putting on any other campaign, all details should be well planned out in advance, else the effort is likely to be disjointed and haphazard in the extreme. Successful business undertakings are never accomplished without a carefully planned campaign, and neither will a Christmas campaign sell goods unless it is one that not only attracts interest,

but holds and leads to a buying interest as well.

A line of selling that has seldom been made use of by the merchandiser of bathroom fixtures is the use of an appeal to attract the attention of the boys and girls of school age. There are, perhaps, no more enthusiastic Christmas shoppers than they, and certainly there is no more impressionable class. With them, the problem of what to buy is of vast importance from more than one angle. Limited funds preclude the purchase of the objects that their generosity and desire to please some dear one would otherwise prompt, and if they can be convinced of the real value and lasting pleasure to be afforded by a gift for the home, the sale is as good as made. A window trim with a showcard appealing to this class of purchaser is one well worth trying out.

SALES PROMOTION PLANS

(Continued from page 21)

"This form of advertising, from the standpoint of the small retailer in the large city, is the best means of advertising, to my mind. It is difficult at any time to trace direct results to advertising but this is one method where it is done more easily than in any other."

Following the conclusion of Mr. Kelley's address, Major Laurie Anthes, chairman of the meeting, tendered him a hearty vote of appreciation on behalf of the large assembly of members of the Live Wire Club who were on hand.

Jimmy Reid, popular member of the club, whose ability as a comedian and vocalist were already well known to the majority of those present, added fresh laurels by his able rendering of a number of Scotch songs, comic and sentimental, while W. Downing's vocal number was well received.

It was announced that arrangements were being made for the paying of a fraternal visit to the Hamilton Club on Wednesday, December 19, on which date, at the request of the hosts, the visitors are to furnish the speaker and entertainment program for the evening. A showing of hands indicated that the Live Wire Club would be well represented on that occasion.

W. C. Hunt Brass Works, Toronto, have been incorporated for \$200,000 to manufacture and deal in brass, copper, metal products, etc., by William C. Hunt, Isaac Johnson, Leonard B. Johnson, and others.

H. J. Logan Co., Toronto, has been incorporated for \$200,000 to manufacture and deal in machinery, implements, rolling stock, and to carry on business as machinists, foundrymen, metal workers, boiler makers, etc., by Robert Wherry, William Zimmerman and Wendell H. Osborne.

Tenders Wanted

Toronto.—Heating and plumbing contracts are to be let on two bungalows, \$5,000 each, to be erected on Poulton Ave. R. G. Sprague, 775 Coxwell Ave., is the owner and is doing the sub-letting.

Toronto.—Sub-trades will be let shortly on block of stores and apartments, \$45,000, St. Clair and Northcliffe Ave. B. Swartz, 336 Dundas St. W., is preparing the plans. He is also receiving tenders on all trades in connection with stores and apartments, \$12,000, south side Bloor West.

Toronto.—Plumbing and heating contracts are to be let on \$12,000 residence, Dunvegan Rd. P. L. Speirs, 92 Northcliffe Blvd., is owner and builder.

Toronto.—Plumbing and heating contracts are to be let on \$18,000 residence and garage being built north-east corner Northcliffe and Rosemount. William Moad, 46 Oakwood Ave., is the owner.

Verdun, P. Q.—Roofing and plumbing contracts are to be let on \$14,000 residence on Third Ave. D. Rolland, 103 Second Ave., is the owner and builder.

Montreal.—Roofing and plumbing contracts are to be let on three residences, \$15,000, on Denormandie for E. Tremblay & Co., 400 Williams St.

Windsor, Ont.—Plumbing contract is to be let on \$18,000 addition to telephone exchange on which Wells & Gray, Ltd., have the general contract.

Toronto.—Heating and plumbing contracts are to be let on \$15,000 addition to garage, rear 3421 Yonge St., owned by B. R. Amodeo, 1216 St. Clair.

Montreal.—Roofing, plumbing, heating and ventilating contracts are to be let on store and flats, 4th Ave. and Masson Sts., for which tenders are being received by the architect, J. E. DePatrick, 381 4th Ave.

Montreal.—Roofing, plumbing and heating contracts are to be let on \$12,000 residence, near 2376 St. Denis St. Z. Lamoureux, 2282 St. Denis St., is owner and builder.

Toronto.—Plumbing and heating contracts are to be let on two pair residences, \$7,000 pair, on Kingston Rd., of which N. J. Liscombe, 55 Keystone Ave., is the owner and builder.

Toronto.—Tenders on sub-trades are being received by the architect, D. H. Burnham, 260 Laurier Ave., on \$15,000 duplex residence being built on Grimthorpe Ave.

Toronto.—Plumbing and heating contracts are being awarded on seven bungalows, \$5,000 each, on Runnymede Rd. D. H. Burnham, 260 Laurier Ave., is the architect.

Burnaby, B. C.—Plumbing and heating contracts are to be let on \$6,471 addition to Edmonds school. Percy & Weedon, 2105 Kingsway, are the general contractors.

Cardston, Alta.—Trades are to be sub-let on \$146,000 school to be built here. General contractors are Claydon Co., Winnipeg.

Montreal.—Roofing contract is to be let on \$125,000 office building going up on Victoria Pier. General building contractors are Collet & Freres, 243 St. Hubert St.

Toronto.—Plumbing, steam heating and sheet metal work in connection with addition to Capitol Theatre, stores and offices, Castlefield Ave. and Yonge St. Tenders are being received by R. McClelland, Capitol Theatre, Yonge St., Toronto.

Mimico, Ont.—Plumbing and heating contracts are to be let on \$10,000 theatre being built here for W. J. McClintock, Lake Shore Rd.

Toronto.—Plumbing and heating contracts are to be let on \$15,000 store and dental suite, Dundas and Centre Ave. W. B. Charlton, 12 Kendal Ave., is the general contractor.

Outremont, P. Q.—Plumbing, heating and tiling contracts are to be let on \$10,000 cottage being built on Dollard Rd. for Z. Filion, 823 St. Hubert. Gody & Tombini, 2934 Drolet, are the general contractors.

Outremont.—Heating and plumbing contracts are to be let on alterations to shop and apartments, \$11,000, on Arlington Ave. J. B. Deane, Carleton, has the general contract.

Contracts Awarded

Toronto.—William Boyd, 18 Austin St., has the heating contract and Christopher Bros., 20 Astley St., the plumbing contract on two residences, \$5,000 each, Craighurst Ave., for William Rayfield, 495 Sherbourne St.

Toronto.—L. C. Carstead, 9 Redpath St., has the heating contract and G. C. Lath, 8 Davisville Ave., the plumbing contract on one pair residences, \$7,000, being built on Montgomery Ave.

Toronto.—W. R. Willis, 189 Broadway Ave., has the plumbing and heating contracts for \$7,000 residence being built on Alexandria Blvd. for F. Markham, 155 Alexandria Blvd.

Toronto.—Harry Rushby, 219 Wychwood Ave., has the plumbing contract and L. C. Carstead, 9 Redpath St., the heating contract

on four residences, \$10,000, on Edith Drive for Thomas W. White, 207 Bathurst St.

Toronto.—George Nunn, 556 Spadina Ave., has the heating contract and George Moore, Bedford Park, the plumbing contract on one pair residence, \$7,000, Castlefield Ave. for G. B. Webb, 76 Orchard View Blvd.

Toronto.—J. Walker, 88 Malvern Ave., has the plumbing contract and L. C. Carstead, 9 Redpath St., the heating contract on four pair residences, \$6,000 pair, Henning Ave., near Eglinton; George Nicholson, 6 High Park Gardens, owner.

Twenty Years Ago

The following items are reproduced from MacLean Pub. Co. trade paper files of December, 1903:

"Bertrand & Bernier, plumbers, etc., have registered in Montreal."

* * * *

"Masson & Dubois, plumbers and roofers, Lachine, have registered."

* * * *

"The McEachern Heating & Ventilating Co., Galt, have dissolved, and Sheldon & Sheldon will continue the business."

* * * *

"If the large orders being received by the supply houses are any indication, the plumbers must be very busy at present and must expect good business during the winter. Lead and iron pipe are in particularly strong demand."

* * * *

"The Credit Forks Vitrified Stoneware Sewer Pipe Co., Ltd., Toronto, has been incorporated with a share capital of \$200,000. The directors are: R. Carroll and John McKnight, Toronto; A. H. Chitty, W. J. Thompson and S. G. Stone, all of Sault Ste. Marie, Ont."

* * * *

"The Automatic Ventilating Closets Co., Toronto, have been incorporated with a capital of \$60,000 to manufacture closets, plumbers' and builders' supplies, for which H. B. Robinson's patent rights have been acquired. The provisional directors are: H. B. Robinson, C. H. Thompson and J. Dougherty, Toronto; G. E. Silvester, Sudbury; and W. Vanuzen, Toronto Junction."

* * * *

"The first steps in an agitation for new plumbing regulations have been taken in Toronto. For several years the Toronto Master Plumbers' Association have had under consideration a by-law which, from their standpoint, would be more advantageous than the present one. Such a by-law has been introduced, Dr. Sheard stating that citizens had complained about the inadequacy of the present regulations and that he had come to the conclusion that amendments were required."

* * * *

"The inaugural social evening of the Toronto Master Plumbers' Association was largely attended. Among the particularly large representation from the manufacturers and jobbers were noticed: W. H. Carrick, Gurney Foundry Co.; Peter M. McMichael, Dominion Radiator Co.; J. H. Patterson, Toronto Hardware Co.; H. W. Anthes, Toronto Foundry Co.; A. A. McMichael, James Robertson Co., Ltd.; Charles Morrison, James Morrison Brass Mfg. Co.; W. B. Malcolm, A. D. McArthur, Mr. Mean, Cullum & Johnson Co.; W. S. Jackson. City representatives of the various firms were also present in the persons of R. Cluff, E. Brewer, W. Helliwell, W. J. Spence, W. Cluff, E. Rogers, C. World and others. Fred Armstrong acted as chairman of the gathering."

Modern Arabian Nights Inbad the Dealer

—From Hardware Age.

Market Conditions and Tendencies

Price Trend on Sanitary and Heating Supplies

Markets at a Glance

H EATING equipment has been the feature of sales during the past two weeks in all centres. Dealers and jobbing firms handling heaters, stoves, furnaces, and boilers, as well as other heating equipment, have received very satisfactory volumes of business, and so far December has proved to be a very satisfactory month. It is the opinion of many close followers of the heating trade that there is much more work in these lines yet to be done before the heating season can be called closed. This work will consist of considerable numbers of new installations as well as a fair volume of necessary repair work which each year is

left until almost the last day of suitable fall weather.

Revisions in prices during the past two weeks have held a distinctly upward trend. The most important of these being an advance in the price of all lines of solder, amounting to about 2½ cents per pound, and cotton plumbing goods, such as candle wick and wastes. Both of these advances were direct results of sharp advances in U.S. primary markets.

The cast iron fittings price revisions, which were announced in the Dec. 1 issue of Sanitary Engineer are made effective in both Montreal and Winnipeg.

The collections situation remains unchanged.

Montreal Markets

MONTREAL, December 13.—Local dealers and jobbing houses report that business has been fairly active during the past two weeks. Sales in stoves, furnaces, and other heating equipment have been of a substantial nature and well up to the average. Higher prices are in effect on cotton wastes. Reduced prices are effective on several lines of pipe fittings, including cast iron elbows, tees, crosses, etc.

The ingot metal markets have been less active this week with price changes not very great. This condition is not surprising in view of the recent sharp advances and the approaching period of the year is also inducive to a lesser volume. In England the elections have been a disturbing factor and naturally have their effect on business.

HIGHER PRICES IN FORCE ON COTTON WASTE

Montreal.

New and higher prices are now in effect on both white and colored cotton wastes. White cotton shows an advance over former prices of one cent per pound on all grades, while colored cotton has advanced ½ cent per pound.

Prices now ruling are as follows:

COTTON WASTES—	Per lb.
Cream polishing	0 25
White, XXX extra	0 21
White, XX grand	0 19½
White, XLCR	0 18
X Empire	0 16½
X Press	0 15
Colored—	
Fancy	0 16
Lion	0 14½
Standard	0 13
Popular	0 11
Keen	0 09
Wool Packing—	
Arrow	0 25
Axle	0 21
Anvil	0 17
Dominion Wipers—	
White cotton	0 18
Colored cotton	0 14

REDUCED PRICES EFFECTIVE ON PIPE FITTINGS

Montreal.

Reduced prices are now in effect on several lines of cast iron pipe fittings.

Cast iron elbows, tees, crosses, etc standard and extra heavy, which took a discount formerly of 10 per cent., are now being quoted at 15 per cent. off.

Malleable iron fittings show no change from prices formerly quoted.

Prices in effect locally are given herewith:

PIPE FITTINGS—Malleable—

Piece list	63%
Bushings	15%
Tinned straps, net per lb.	20
Sd. unions	30%
Railroad unions (black)	35%
Railroad unions (galv.)	40%
Crossovers	25%

CAST IRON—

Sd. elbows, tees, crosses, cap reducers, etc.	15%
Extra heavy ditto	15%
Plugs	10%
Bushings	15%
Eccentric reducers	plus 5%
Drainage fittings (black)	22½%
Drainage fittings, (galv.)	27½%
Flanged unions	10%
Companion flanges	22½%
Flanged fittings	20%
Branch tees	5%
Nipples, 1½ to 4" close and short.	45%
Ditto, long	50%
Ditto, 4½ to 8" close and short.	35%
Ditto, long	40%
Couplings, 4" and under	25%
Ditto, 4½ and larger	5%

LEAD AND ZINC PRODUCTS ARE FAIRLY ACTIVE

Montreal.

While lead products are steady in price following the recent advance, it would not be surprising if further advances take place in the near future, as lead at the present time is strong, both in Europe and the United States, and indications point to a firm market for the next month or two at least. Consumption at the present time is heavy in all quarters and there is no surplus available. In England the shortage is especially pronounced and values are considerably higher than on this side.

Prices in effect locally are given herewith:

LEAD AND ZINC PRODUCTS—

Lead pipe, per 100 lbs., up to 2 in.	14 50
Do., 2 in. to 8 in.	15 50
Do., 8 in. and over.	16 50
Lead waste, per 100 lbs.	15 50
Discount 10 per cent.	
Lead wool, lb.	0 15
Lead sheets, 2½ lbs., sq. ft. lb.	0 11½
Lead sheets, 3 to 3½ lbs., sq. ft. lb.	0 11
Do., 4 to 8 lbs., sq. ft. lb.	0 10½
Cut sheets, ¾ c. lb. extra and cut sheets to size 1 c. lb. extra.	
Soldier, wiping, lb.	0 25½
Solder, commercial, lb.	0 26
Solder, strictly, lb.	0 27
Solder, guaranteed, lb.	0 30
Solder wire, lb.	0 39
Zinc sheets, casks	0 11
Do., broken lots	0 12

PRICES ON CANADA PLATES REMAIN FIRM

Montreal.

Prices on Canada plates are very firm at the present time. Distributors report that sales are only fair at present, as the consumer in most cases has bought his requirements for the season.

Prices are being well maintained and are given herewith:

CANADA PLATES—

Half bright, 60s	6 00
Half bright, 52s	5 90
Blued 52s	5 90
Blued 60s	6 00
Welsh, polished, 60s	7 50
Welsh, polished, 52s	7 75
Galvanized, 52s	7 75
Galvanized, 60s	8 00

BAR IRON PRICES REMAIN FIRM

Montreal.

Firm prices are being maintained on bar iron and steel. Sales are said to be somewhat on the quiet side at present and of a more or less hard to mouth nature. Trading in this line is expected to show considerable improvement after the first of the year.

Prevailing prices are given herewith:

IRON AND STEEL—

Common bar iron, 100 lbs.	3 90
Iron finish machinery steel.	4 00
Mild steel	3 90
Single reeled machinery steel.	5 00
Band steel	3 90
Sleighshoe steel	3 90
Spring steel	5 25
Tire steel	4 15
Harrow tooth steel	4 15
Mining tool steel, per lb.	0 18
Black Diamond tool and cast steel, per lb.	0 19

RADIATOR AND BOILER SALES HOLDING UP WELL

Montreal.

Sales in practically all lines of heating equipment are showing up fairly well at the present time. Dealers report that considerable repair work is being done and that a good volume of business is being done in new equipment.

Prices are steady and are given herewith:

RADIATORS AND BOILERS—

Radiator list prices are for 1, 2, 3, 4 and 5 column radiators, per sq. ft.

45 in. to 38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60. Discount 44 per cent for hot water, and 45 per cent for steam.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05; Discount 41 per cent.

Boilers—Round . A water boilers, sizes from 0 to 10, 52 per cent. off list. Square or sectional hot water or steam boilers, 15 in., 3 per cent. with Ontario Government trimmings, list. Square or sectional water boilers, 19 in. to 36 in., 8 per cent. Square or sectional steam boilers, 19 in. to 26 in., 6 per cent. Ontario Government trimmings, list plus 7 per cent. Square or sectional water or steam boilers, 48 in., list plus 10 per cent. With Ontario Government trimmings, list plus 13 per cent.

Round steam boilers, standard trimmings, 16 per cent. Ontario Government trimmings, 13 per cent.

F.o.b. Montreal, Toronto, Guelph.

COMPRESSION GOODS SELLING IN FAIR QUANTITIES

Montreal.

Sales in compression goods during the past two weeks are reported as being fairly active.

Prices are unchanged from former levels and are given herewith:

VALVES AND BIBBS—

Compression work, standard.	48%
Fuller work, standard	30%
Quick opening, compression bibbs.	45%
Bath cocks, quick opening.	53%
Bath cocks, compression	45%
Basin cocks, quick opening.	50%
Flatway stop and waste cocks, std.	56%
Roundway stop and waste cocks, std.	42%
Brass steam cocks, standard, 1/4 in.	25%
Radiator valves, standard	55/25%
Do., removable discs	55/25%
Globe, angle and check valves, std.	20%
Gate or straightway, Webber.	22%
Emco disc globe valves.	25%
Emco disc check valves	25%
Jenkins globe, angle, check and swing check	plus 15%
Jenkins gate or straightway	plus 11%
Jenkins iron body, globe and angle.	10%
Jenkins iron body, gate.	12%
N. P. "O" and "S" traps.	34%

Japan Increases Output of Sheets

WHILE placing large orders with American and European makers for structural shapes and galvanized sheets, the Japanese government is taking steps to increase domestic production. The government has helped Tokio galvanizers out of their difficult position and they are operating to produce 10,000 tons a month. The steel mills in the earthquake zone have been given an informal promise of assistance.

At the government steel works a plate mill is to be closed at once, the men in the mill being transferred to sheet mills. Another plate mill is to be used in preparing ingots for sheet mills. At sheet mills and structural shape mills, operations are to be extended two hours a day.

The monthly production of steel ingots, when the change is fully carried

out, is due to be 54,300 tons, while monthly production of shape will be increased to 39,500 tons, including structural shapes and rail to the extent of 17,550 tons.

The government steel works have decided to accept mercantile orders. The monthly tin plate sale, for instance, has been resumed. The supply of steel is being increased steadily.

In the steel market bars are quoted at 5 yen (\$2.45), per 10 kwamme (82.67 pounds). Sheets are quoted at 8.50 yen (\$4.16) per 10 kwamme. The average price of nails is around 20 yen (\$9.80) per keg. Galvanized sheets are quoted at 1.95 yen (\$0.95) per sheet. These prices are above those prevailing before the earthquake.

The government discountenances any more price increases.

GALVANIZED SHEETS SELLING WELL IN HEAVIER GAUGES

Montreal.

Sales in galvanized sheets have fallen off to a certain extent, as the demand for iron for roofing purposes is practically over for the year.

Dealers report that there is a ready sale at the present time of the heavier gauges. Prices are steady and show no change from those recently issued.

TIN PLATE SELLING IN FAIR QUANTITIES

Montreal.

Dealers report that there is only a fair demand for tin plate at present, as the consumer in most cases has sufficient quantity to carry him through the season. Fair size replacement orders are, however, coming in from time to time.

Prices are firm locally and are as follows:

TIN PLATES—

20 x 28 x 100 lbs. basis	15 50
20 x 28 IC, 112s	16 00
20 x 28 IC, 112s	18 00
20 x 28 IXX, 56s	11 00
28x28 IXXX, 56s	12 50

TERNE PLATES—

20 x 28 IC, 112s, 200 lbs.	14 50
20 x 28 IC, 112s, 214 lbs.	15 00

BLACK SHEETS MOVING IN FAIR QUANTITIES

Montreal.

With the exception of the heavier gauges, little trading is being done by dealers locally in black iron sheets.

Prices are unchanged and are quoted as follows:

BLACK SHEETS—

18-20 gauge	5 40
22-24 gauge	5 45
26 gauge	5 50
28 gauge	5 60

A charge of 25c per 100 lbs. is made for less than case lots. An extra 10c. per 100 lbs. is also charged on sheets 26 in. wide.

SALE OF CLOSET GOODS FAIR AT PRESENT

Montreal.

A fair volume of business has been done in closet goods during the past two

weeks. Prices are unchanged from levels formerly quoted and are given herewith:

CLOSET COMBINATIONS—

Low Down Outfits,	each
Closet, standard outfit, oak.	24 00
Do., post hinge seat	24 50
Do., oak vitro or Pussyfoot	24 00
Do., post hinge seat.	24 50
Do., mahogany vitro or Pussyfoot, post hinge seat and cover	27 00
Do., vitreous china, oak post hinge seat and cover	29 00
Do., vitreous china, mahogany post hinge seat and cover.	29 50
Do., white vitro or Pussyfoot, mahogany post hinge seat and cover	30 00
Do., enamelled iron tank, oak post hinge seat and cover	28 75
Do., enamelled iron tank, mahogany post hinge seat and cover.	29 00
Add for 3/4" valve on supply pipe	1 25
Add for spud	0 60
Add for reverse trap bowl.	1 50
Add for syphon jet bowl	7 00

Less 35 per cent.

STRENGTH OF LEAD FEATURE OF INGOT METAL MARKET

Montreal.

The metal markets have been less active this week, with changes in prices not very great. This is not surprising in view of the recent sharp advances and the approaching period of the year is also inducive to a lesser volume. In England the elections have been a disturbing factor and naturally have their effect on business.

TIN.—The market opened strong on Monday, but there was a slight reaction chiefly caused by profit taking. This is not surprising, but there is a feeling that the advance may be resumed next week. There is talk in London of a scheme for stabilizing the price of tin,

but this would be rather difficult to arrange and is more or less in the air at present. The local market is steady at 53½c. per lb.

COPPER.—It is evident that no sustained advance can be looked for until production has been curtailed somewhat, and there is no sign of this up to the present. It is fortunate that consumption in the United States has been as good as it has been or the surplus would be much greater. While prices are low, they are not likely to improve very materially just yet. The local market is quiet at 18½c. for electro and 18c. for casting.

LEAD.—This is the strongest metal on the list both in Europe and the United States, and there is every indication of a firm market over the next month or two at least. Consumption continues very heavy in all quarters and there is

no surplus available. The shortage is especially pronounced in England, where values are on a relatively higher level than on this side. The local market is strong at 9½c. per lb.

SPELTER.—This metal continues to ebb and flow within narrow limits and there is no pronounced trend in any direction. The London market never approaches a point where export is possible, and until this is in evidence the United States market cannot improve materially. The local market is quiet at 9¼c. per lb.

ANTIMONY.—This metal is quiet but firm and demand temporarily fallen off. In view, however, of the small shipments from the East there is bound to be a certain shortage after the turn of the year. The local market is unchanged from last week with English quoted at 9c. and Chinese at 8½c. per lb.

Toronto Markets

TORONTO, Dec. 13.—Local dealers report that a very satisfactory volume of business has been handled during the two weeks that have just passed. Heating goods are the outstanding lines at present. Many new heaters as well as furnace and boiler equipments have been installed this month, as well as much repair work being done on old plants. Practically all local heating engineers are still very busy, and much local work is still expected before the end of the heating season.

A decline has been made in Quick Opening radiator valves. The general trend in prices has been upward during the past two weeks. Cotton waste prices have advanced 1 cent per pound for white, and ½ cent per pound for colored. Cotton candle wick has also advanced from 73 cents to 79 cents per pound. Solder has advanced in price about 2½ cents per pound in all lines. One line of roofing nails has also advanced 25 cents per keg and ingot tin prices advanced sharply to \$54-\$55.

Galvanized sheets, Canada plates and cast and malleable pipe fittings are very firm at present quotations.

ADVANCE MADE IN PRICES OF SOLDER

Toronto.

The advances of last week and the week before in lead prices in United States have affected the local solder prices inasmuch as an advance has been made in all lines of solders.

The advance in the United States of from \$3 to \$5 per ton on pig lead during the past two weeks has gone far toward strengthening prices in local lead and zinc.

Prices in force are given herewith:

LEAD AND ZINC GOODS—

Lead pipe, per 100 lbs., up to 2"	14 50
Do., 2" to 8"	15 50
Do., 8" and over	16 50

Do., do., less, lb.	0 12

STELCO ROOFING NAILS ADVANCE TWENTY-FIVE CENTS

Toronto

Stelco felt roofing nails undergo an advance of 25c. per keg. The one inch by 10 ga., bright, which has a 9-16 inch head, which previously was selling at \$8.50 per keg, now sells at \$8.75 per keg. The one inch by 10 ga., galvanized, which also has a 9-16 inch head, and which was selling at \$11.00 per keg, is now being quoted to the trade at \$11.25 per keg.

Q. O. RADIATOR VALVES DECLINE IN PRICE

Toronto.

A decline has occurred in the prices of quick opening radiator valves of the Emco type. The discount on these valves formerly was 70.2 per cent. off list prices. The new and lower prices now effective are a result of a new discount of 74.2 per cent. being put into effect on both the No. A888 Q. O. radiator valve, which is without the union, and the No. A889 Q. O. radiator valve which includes the union.

THE *Little Giant* PIPE WRENCH

Patented Feb. 4, 1913

—as Strong as
Its Name Implies

To fill a long felt need, the **Little Giant** was designed not only to reach the holes and corners and other "inaccessible" places, but with added **STRENGTH** to stand the gaff which regular pipe wrench duty requires.

Each of its three simple parts are made of the best drop-forged steel with metal perfectly proportioned to insure ability to stand up under the added leverage given by the extra length handle.

The double sets of teeth on the smaller sizes and the quadruple sets on the larger ones assure two to four times the wear, because the jaw can engage with any set you want to use.

Order **Little Giants** for your personal use and for your men. They will pay dividends throughout their long life.

All **Little Giant** Wrenches are positively guaranteed.

Send for circular No. 302 E.

One Engineer Writes of His Two Little Giants:

"I wouldn't take a hundred dollars for them if I couldn't get any more."

Isn't such satisfaction worth the regular price to you?

GTD Screw Plates, Taps, Dies, Reamers, Gages,
Pipe Tools, Twist Drills, Machine Tools.

Drive Started to Eliminate Odd Sheet Sizes

A. T. ENLOW, president of the Dominion Sheet Metal Corporation, has opened a drive to eliminate non-standard items from stocks of both manufacturers and jobbers of galvanized flat sheets.

"In the nine gauges of sheets which are being rolled in Canada," says Mr. Enlow, "there are 99 sizes, ranging from 24 x 72 to 36 x 120. It has become both onerous and expensive to manufacturers and dealers to keep all these sizes in stock, and, with a view to eliminating those less-frequently-used sizes, we have issued a questionnaire to all users of galvanized flat sheets, requesting their opinion as to the sizes which could most

easily be dropped. A great many replies to the questionnaire have already been received.

"It can easily be seen that considerable saving will be accomplished if even a few sizes are eliminated. Much material and space is being unnecessarily tied up, to say nothing of depreciation in stock which is being carried too long. The saving will be reflected in lower prices and better service. Odd gauges and sizes can always be put through on special order.

"When the mind of the users of Canadian sheets has been determined, we will draw up a standard list and submit it for further scrutiny before adoption."

Other lines of valves are unchanged in price and are given with the new discounts in the list herewith:

INGOT TIN PRICES ADVANCED

Toronto

Ingot metal prices with the exception of tin were quiet and less active during the past two weeks. The price of ingot tin which was \$52.50 has been advanced to \$54 to \$55. Prices on other ingot metals are also given herewith:

INGOT METALS—

Copper, \$18.00 to \$19.00; Tin, \$54 to \$55; Lead, \$8.25 to \$8.50; Spelter, \$9.00; Antimony, \$8.25 to \$8.50; Aluminum, \$23.00 to \$25.00.

COTTON CANDLE WICK ADVANCES TO 79 CENTS PER LB.

Toronto.

The price of cotton candlestick, which has been 73 cents per lb., has advanced with some other lines of cotton goods and is now selling at 79 cents per pound.

PIG IRON ADVANCES \$1 PER TON

Toronto

Buying of pig iron both for present and first quarter use continues in fair volume and in marked contrast to the apathy shown during the past several months. An advance of \$1 a ton on all grades was announced by producers, which makes the quotations at Toronto, \$29.15 for No. 1, and \$28.65 for No. 2. There is but slight improvement in the volume of work being booked by foundries in this district.

Warehouse transactions of the past week have been very satisfactory and dealers are of the opinion that the month will be highly satisfactory. Changes in price have not been noted. The bar base remains at \$3.75 to \$3.90, with reinforcing bars at the same base. Steel bars from mill stock have been laid down in Toronto at \$3.50 during the past week. Two inch lapwelded tubes have been purchased at \$19, in small lots, 2 1/2 inch at \$22, and 3 inch at \$29, although this is somewhat at variance with the quoted prices of warehousemen.

PIG IRON—

No. 1, per ton	29 15
No. 2, per ton	28 65

SALES OF SCRAP MATERIALS SHOW NO INCREASE

Toronto.

Scrap metals are moving very slowly. No alterations in price have been made

this week and it is doubtful whether there has been any increase in business.

There has been some stiffening in prices in U. S. scrap but it has not been reflected in Canadian markets up until the present.

PRICES STILL FIRM ON CANADA PLATES

Toronto.

The prices are still very firm on Canada plates, owing to small stocks on hand with distributors.

Prices remain unchanged from former levels.

MALLEABLE FITTINGS PRICES ARE FIRMER

Toronto.

Though some slight concessions were made in listed lines of malleable fittings the week before last and some jobbers were selling at a slightly lower price, the price is at present well maintained at former levels, which were 63 per cent. discount off the regular malleable fittings list.

Prices quoted on other lines of malleable cast fittings in Dec. 1 issue of Sanitary Engineer are still effective and are given in list herewith.

STOVES AND FURNACES HAVE GOOD SEASON

Toronto.

Stoves, furnaces and heaters have sold very well during the fall. Prices are steady and unchanged from those quoted formerly.

A decline is expected toward the end of December in the price of some of the above lines, but as the anticipated re-

You Can Prove That Gurney Boilers are "Small Eaters"

About the first question a heating system customer fires at you is this: "Is it hard on coal?" Or something along that line. And on your answer often hinges some good business for you.

You've doubtless had that happen more than once. I need hardly remind you of the answer in the case of a Gurney Heating System.

You can guarantee Gurney Boilers to have small appetites for coal. There are years of performance behind that claim. I have had many users declare that it costs one-third less to run a "Gurney."

After all, that's exactly the purpose of such Gurney construction features as deep firepots with overhanging walls, triple-lived triangular roller-type grates and our patented "Economizer."

If you're not positive in your own mind that you can give prospects full details of the economical Gurney System, write to me personally today. I'll welcome the chance to prime you with business-getting information.

Yours for team work,

Holt Gurney

Gurney

Gurney Furnaces for Steam, Hot Water and Warm Air
—Gurney Stoves for Electricity, Gas, Coal and Wood
are good products worthy of the Gurney name

No use claiming coal economy for any Boiler unless you can prove it. We used the above special border to enclose a message to householders on the "Small appetite" features of Gurney Boilers as proven by owners. That advertisement spoke for you in saying "Our heating engineers and steamfitters are at your service to prepare estimates and give you experienced advice." That's the kind of advertising service we want you to turn to your own benefit. Are you doing it?

Economy is one of the three proven virtues of Gurney Heating Systems. Efficiency and elasticity are the other two. Knowing this boiler supremacy, you can stake your reputation on a "Gurney" every time—and never get let down.

By the way, have you the latest Gurney Heating literature? Write for it.

duction is in the neighborhood of 2 per cent., it will not appear, as an additional amount will be added to prices to cover sales tax, which will be absorbed in selling prices to the trade.

PRICES ON FLEUR-DE-LIS SHEETS REVISED

Toronto.

A slight revision and firming of prices has taken place during the past two weeks on Fleur-de-Lis galvanized sheets.

Prices on other brands of sheets remain at the levels published by Sanitary Engineer, Dec. 1 issue.

There is very little local price cutting on these lines now; the prices being quoted are representative of the market almost entirely.

Prices are given herewith:

RADIATORS AND BOILERS SELL IN FAIR VOLUMES

Toronto.

Notwithstanding the warm and unseasonable weather which has been experienced in Ontario during the past fortnight, fair quantities of radiators and boilers have been selling.

Prices are as formerly quoted in Sanitary Engineer, and together with ruling discounts are given herewith:

RADIATORS AND BOILERS—

Revised radiator list prices are for 1, 2, 3, 4 and 5-column radiators per square foot.
38 in., \$1; 32 in., \$1.10; 30 in., \$1.15; 26 in., \$1.20; 23 in., \$1.26; 22 in., \$1.30; 20 in., \$1.36; 18 in., \$1.40; 16 in., \$1.50; 14 in., \$1.55; 13 in., \$1.60.

Discount on 2, 3, 4 and 5 column standard sizes, 44 per cent. for water and 45 per cent. for steam.

Discount on 1-column standard size, and 2, 3, and 4-column hospital sizes 36 per cent. for water and 37 per cent. for steam.

Discounts on 1 column hospital size water 22 per cent. Steam 23 per cent.

Wall radiators—5 ft., \$1.15; 6 ft., \$1.10; 7 ft., \$1.05; 9 ft., \$1.05; 12 ft., \$1.05. Discount 44 per cent.

BOILERS—

Water:

Round 52 per cent. off list. Square 8 per cent. off list.

Steam:

Round, 13 per cent. off list; Square, list plus 7 per cent.

GALVANIZED SHEET PRICES STILL FIRM

Toronto.

The new prices quoted in Dec. 1 issue of Sanitary Engineer, on galvanized sheets are still being firmly maintained.

TIN PLATE PRICES FIRM BUT UNCHANGED

Toronto.

No price changes have occurred on tin plates during the past two weeks.

Prices now in effect locally are being firmly maintained.

TANK STEEL PLATE PRICES STIFFER

Toronto.

During the past two weeks, tank steel plate prices have stiffened slightly. $\frac{1}{4}$ -inch, and heavier, base price is now \$3.75

to \$3.90, and 3/16-inch is now being quoted at \$4.14 to \$4.25 per 100 pounds.

Black and blue annealed sheets are quoted at former prices.

BLACK SHEETS—

18-20 gauge.....	5 40
22-24 gauge.....	5 45
26 gauge.....	5 50
28 gauge.....	5 60

A charge of 25c. per 100 lbs. is made for less than case lots. An extra 10c. per 100 lbs. is also charged on sheets, 26 in. wide.

BLUE ANNEALED SHEETS—

10 gauge, base.....	4 60
12 gauge.....	4 65
14 gauge.....	4 70
16 gauge.....	4 80

TANK STEEL PLATES—

$\frac{1}{4}$ -in. and heavier, base.....	3 75	3 90
3-16 in.....	4 15	4 25

Winnipeg.

WINNIPEG, Dec. 13.—Local dealers report seasonable business with noticeable activity in heating equipment. The firm tone prevailing on the cotton market has been reflected on the local market by an advance on cotton waste and cotton candle wick. Tap plugs are quoted at higher prices. Cast iron collars show a slight decline. A revision in discount is noted on plugs and bushings. Lunkenheimer valves show an upward revision in discount. Galvanized sheets and Canada plates maintain a firm tone and with the market ruling firm, higher prices are expected.

COTTON WASTE PRICES MOVE UPWARD

Winnipeg.

The strong tone of the cotton market has been reflected by an advance on all lines of cotton waste. Latest quotations are as listed below:

COTTON WASTE—

NEH Full Bales.....	19 25
Broken Quantities, per lb.....	0 20 $\frac{1}{4}$
In 10 lb. pkgs.....	0 21 $\frac{3}{4}$
REM Full Bales.....	22 50
Broken Quantities, per lb.....	0 23 $\frac{1}{2}$
Colored Full Bales.....	15 75
Broken Quantities, per lb.....	0 16 $\frac{3}{4}$

COTTON CANDLE WICK ADVANCES TO 80 CENTS PER POUND

Winnipeg.

Quotations on cotton candle wick have been advanced to 80c. per lb. Plumbers' oakum is quoted at \$8 per bale and 10c. per lb. in small lots. Hemp packing is quoted at 35c. per lb.

TAP PLUGS REACH HIGHER LEVELS

Winnipeg.

Tap plugs for repairing leaks in boilers, radiators, iron pipe fittings, etc., are quoted at higher levels and prices prevailing are as listed below:

TAP PLUGS—

Per doz.—Size— $\frac{1}{4}$ in. \$2.40; 5/16 in. \$2.48; $\frac{3}{8}$ in. \$2.72; 7/16 in. \$3.10; $\frac{1}{2}$ in. \$3.27; 9/16 in. \$3.85.

DECLINE NOTED ON CAST IRON COLLARS

Winnipeg.

Cast iron collars, tapped, for 1 $\frac{1}{2}$ in. iron pipe, show a slight reduction and quotations are 25c. each.

REVISION IN PRICE ON PLUGS AND BUSHINGS

Winnipeg.

A revision in discount is noted on plugs, bushings, standard flange unions and Dart unions. Plugs are quoted at

list price less 10 per cent., bushings and flange unions at 5 per cent. and Dart unions net list price.

LUNKENHEIMER VALVES REACH HIGHER LEVELS

Winnipeg.

Practically all lines of Lunkenheimer valves show an upward revision in discounts and following are revised quotations:

LUNKENHEIMER VALVES—

Globe R-new—list price plus 55%.
Angle Renew—list price plus 55%.
Globe Fernew—list price plus 4%.
Needle Valves—list price plus 40%.

VALVES SHOW A REDUCTION IN DISCOUNT

Winnipeg.

A revision in discount is noted on all lines of valves. Revised prices are as follows:

VALVES—

Horizontal check valves—list price plus 4%.
Globe and angle valves—list price plus 60%.
Angle Check, size $\frac{1}{8}$ to $\frac{3}{4}$ in.—list price plus 90 per cent.
1 to 2 inch—75%.

PRICES ON RANGE BOILERS CONTINUE STEADY

Winnipeg.

No changes have been made in the price of range boilers and prices now in effect remain steady.

SOIL PIPE MAINTAINS STEADY TONE

Winnipeg.

Prices on soil pipe continue steady. Trading on this line is reported quiet by dealers, as the season is practically over. However, prices are well main-

KERR VALVES

Weight Where Required

In Kerr Radiator Valves ample metal has been provided to take care of strains where strains occur. Each valve is thoroughly tested and packed before shipment.

Each Kerr Valve is mounted with best quality black wood wheels and is fitted with the "Radium Disc."

Strength, durability, efficiency, and appearance are so combined in these better valves that thorough and permanent satisfaction is assured.

Use them on every heating job

Gentlemen:—

Please send me samples of RAWLPLUGS and further information that will be of interest.

NAME

ADDRESS

tained and no changes are looked for until early in the spring.

FIRM PRICES MAINTAINED ON COMPRESSION GOODS

Winnipeg.

Sales of compression goods have been on the quiet side and prices show no change as compared with our last issue.

SHEET AND PLATE PRICES SHOW FIRMER TENDENCY

Winnipeg.

Prices of Canada plates and galvanized sheets, though unchanged locally, are showing a firmer tendency on primary markets and indications point to an advance in the near future. There has been a fairly steady demand for these lines.

SEASONABLE DEMAND FOR CLOSET GOODS

Winnipeg.

Sales of closet combinations, bowls, tanks and seats are reported seasonable by the local trade. Quotations remain steady and show no change.

SALES OF RADIATORS AND BOILERS CONTINUE STEADY

Winnipeg.

Sales of radiators and boilers continue fairly active and repair work on furnaces and heaters continues on a wide scale.

EAVESTROUGH AND CONDUCTOR PIPE UNCHANGED

Winnipeg.

Sales of eavestrough and conductor pipe have fallen off with the approach of colder weather. Prices show no change.

THIS YEAR'S INVENTORY IMPORT- ANT TO SANITARY ENGINEER

(Continued from page 13)

the work comes in here. When goods of the "shelf-warming" or slow-moving variety are located (every shop has a few of these lines, no matter how carefully the stock is looked after), the column set aside for special markings should be utilized. A special check mark which means "overstocked" should be known and used in each case when "shelf warmers" are located.

A second mark meaning "understocked" is also used by many dealers for the assistance of the proprietor or buyer when it is found necessary to fill up stocks after stocktaking. This mark may be applied against items of salable lines that have been permitted, either intentionally or unintentionally, to run down. The average salesman has a pretty good idea when a stock is sufficient or otherwise, and these marks can be used to good purpose.

Overstocked items can be picked out later and disposed of at reduced prices wherever they can be best worked in.

The majority of operators adhere to the plan of pricing all goods at pres-

ent cost or replacement value. Damaged or shopworn goods should be "marked down" in price or else repaired and made salable prior to the inventory. Many dealers apply a special mark to shopworn lines, and they are cleaned out later at reduced prices.

The safest and best advice that can be given on stock pricing is to price each item carefully and correctly, and if any deviation is made from replacement prices, it should be made on the conservative side.

It is very necessary to keep track of all incoming goods as soon as the inventory taking starts. Everything which arrives during inventory taking and afterwards, if it is billed on an invoice dated prior to the day set aside as date of inventory, must be included on the stock sheets. These goods should be entered on the stock sheets right off the invoice, then the goods should be tagged or marked "taken" and should not be put into stock until everything is written in. Goods arriving either before or after inventory date, covered by invoices which are dated after date of inventory, should be checked up and also marked "taken," though they are really not entered and have no place in the inventory. Marking them "taken" eliminates the mistake of entering them, should they be labelled "not taken."

Sales Tax Affects Prices

A rather unique situation arrives in connection with the pricing of stocks where the inventory date is set at closing time, Dec. 31, 1923, which will be the case with some merchants.

With the increased sales tax becoming effective Jan. 1, the replacement of most stock would cost more than the cost on Dec. 31, therefore the stock value is enhanced overnight. This is arrived at by taking the difference between the present sales tax, which is in some cases $4\frac{1}{2}\%$, and the new sales tax which will be applied after Dec. 31 of this year. On goods on which $2\frac{1}{4}\%$ is paid, the difference, of course, will be greater, but it is affected by the income returns in the same way. While there will be a tendency to price the inventory in some cases at the enhanced value, the extra work in connection with this plan would eliminate any advantage that this small addition would create.

Remember what was said in the foregoing about being on the conservative side, and, while it is nice to see a large inventory total, it will be found that this increased inventory total will also increase the amount on the return sheet which is subject to Dominion Income Tax. In other words, in following this practice, one would be paying taxes on a small amount prior to the time when this amount is turned over for profit.

An illustration of the point as it would appear on the Dominion Income Tax returns is explained by the two tables which accompany this article. The year's profits are arrived at by adding the opening inventory (which was last year's closing inventory) to this year's pur-

chases, which represent the total "cost" of goods on which the year's trading was done. This total is subtracted from the result obtained by adding the year's sales total to the closing or present inventory.

An example of return sheet on which goods were priced at December, 1923, "costs" only, is given on this page in comparison with a second example of the same figures, with the additional $1\frac{1}{2}\%$ per cent. added to 1923 inventory figures.

It will be readily seen from the comparative tables that, when the inventory at the end of the year is enhanced, the gross trading profit for the year is also enlarged, which will materially swell the amount on which the year's income tax is estimated. This can be avoided by simply ignoring the $1\frac{1}{2}\%$ per cent. change in values which takes place, so far as inventory for this year is concerned, and by pricing goods in the usual way at cost.

Much Office Work To Be Done

Writing in the stock is not the only work to be done by any means. Every minute that can be spared during the evenings and days should be utilized to the fullest extent in the office on the books, and this part of the work should not be left until the last. Of course, it is always assumed that books are posted up to date, or as nearly so as possible. All work of finding the amount of ledger accounts will have been done and records taken.

The existing cash balance at the bank and on hand should be verified and the exact amount struck on the inventory date.

TABLE I.

(Supposed) total of merchandise sold during 1923	\$55,000.00	
(Supposed) inventory of merchandise at commencement of year at cost price.....	12,000.00	
Add cost of merchandise bought for sale, including freight and duty.	40,000.00	
	\$52,000.00	
Less inventory of merchandise at end of year at cost price	\$10,000.00	42,000.00
Gross Trading Profit for year		13,000.00

TABLE II.

(Supposed) total of merchandise sold during 1923.....		55,000.00
(Supposed) inventory of merchandise at commencement of year at cost price.....	12,000.00	
Add cost of merchandise bought for sale, including freight and duty ..	40,000.00	
	52,000.00	
Less inventory of merchandise at end of year at cost price, (adding on the extra $1\frac{1}{2}\%$ per cent. after Jan. 1, caused by increase in sales tax)	10,150.00	41,850.00
Gross trading profit for year		13,150.00

Canada's total Empire exports for the year ending October amounted to \$438,619,618, as compared with \$379,266,150. Imports from other parts of the Empire during the year amounted to \$197,195,180, a gain over the \$165,758,679 in the previous year.

Are These The Opportunities You're Looking For?

Fan Heating and Ventilating Engineering is the pinnacle of all other forms of heating, and of all branches of steam fitting and sheet metal work. It prepares you for:

1. For Employers it enlarges their business opportunities 100%.
2. Employees it raises to Foremanship of a large shop.
3. Or as Designing Engineer of some large Heating Contractor.
4. As an intelligent Salesman of Heating Appliances.
5. As Chief Engineer with a Heating or Furnace Manufacturing Company.
6. Later a Consulting Engineer to Architects and Building Contractors, etc.

Which of These Are You Working for?

Full Information Free.

PNEUMATIC WATER SUPPLY SYSTEM

Gives country residents all the advantages of a city water system without the excessive cost

The wide-awake dealer will make big profits out of this system among customers who now have difficulty with their water supply. It is so simple to operate and costs practically nothing for upkeep.

The outfit consists of an air-tight steel tank which can be placed in the basement, and a "Myers" famous guaranteed pump (hand or power), suitable for pumping air or water, together with pipes and fittings.

Any plumber or gas fitter can easily install it. Every outfit guaranteed to do the work for which it is designed. For small or large dwellings.

Write us for Water System Catalogue and prices. Now is the time to interest your customers.

Yuletide Greetings

TO ALL members of the trade we extend Christmas Greetings and Best Wishes for success in the New Year.

And we wish to greet in a very special way all who are associated with us in the selling of King Boilers and Imperial Radiators.

In 1924, as in the past, we shall strive to maintain the quality of our product, to improve it when found possible and to give you a coast to coast service.

We thank you for your past patronage and support; we shall try to merit its continuance in the future.

**When Answering Advertisements Mention
SANITARY ENGINEER**

To All The Trade
We Extend
Hearty Christmas Greetings

 OUR message is short but packed with good will and sincerity. May you have the happiest Christmas ever, and may 1924 usher in for you a year of good health and good business.

TORONTO HARDWARE MFG. CO.
LIMITED

The Measure of Your Message

THE measure of your message is the number of actual readers reached by the publications carrying your advertising.

You may buy "10,000 circulation," but is it delivered, or is it merely a "claim" of the publisher?

The A. B. C. offers a service that will enable the advertiser and advertising agent to measure every message placed in the leading publications of the United States and Canada.

Every day in all parts of the continent A. B. C. auditors are checking the records of publishers, and their findings are tabulated in the form of A. B. C. reports.

These reports, by the authentic, reliable, verified data they contain, enable the advertiser to measure exactly how widely his message has been distributed.

Sanitary Engineer is the only plumbing and heating paper in Canada that has submitted its circulation to an audit by the Audit Bureau of Circulations.

Christmas 1923

Greetings from the
Staff of
Sanitary Engineer

TO the many advertisers and prospective advertisers with whom we have had the pleasure of co-operating in the past year—

To the subscribers who have so often helped us with information

—And to all our readers, everywhere, we extend our best wishes for a Merry Christmas and a Happy and Prosperous New Year.

*To the Good Friends of
Business—
Heartiest Christmas Greetings.*

FRIENDLY relations in business, built up on good faith and mutual respect, are one of the finest reflections we can have at the Christmas season. We are happy in the conviction that our customers are our friends, that the folks we live with in a business way are human, companionable, amiable beings, square and fair — and we hope they may have the things that will make them happiest during the coming year.

Greetings to the Trade

On behalf of my associates and myself I wish to thank the sanitary engineers of Canada for the warm support they have accorded us and our products in the year now closing.

In 1924 it will be our aim and effort to render you even better service and provide you with better merchandise than ever before; we ask the favor of your continued patronage.

To each and every one of you a Merry Christmas and a Happy New Year.

T. G. GRIFFITH,

ONTARIO

DART UNIONS

Union Pipe Couplings

are practically indestructible because they are made of Heavy Malleable Castings, and the joint being Bronze against Bronze, gives the strongest kind of guarantee that the Dart will stay as tight as it is first made when screwed to a pipe line.

The Dart's reputation is based on the opinion of others; ask anyone who has had experience with Dart Unions, regarding their efficiency.

ORDER FROM YOUR JOBBER. There's a variety of styles to fill all requirements.

MANUFACTURED BY

DART UNION CO., LIMITED
